THE BUILDING NEWS
AND ENGINEERING JOURNAL.

PROGRESS OF THE ARCHITECTURAL CRAFTS.

THE great impetus given to building industries during the last decade or two has very considerably altered the relative positions and functions of the trades and crafts connected with building. In the architectural profession itself many similar changes have taken place. A variety of experts have arisen who have interfered very much with the duties and province of the architect's profession. The "all-round" practitioner has felt it as seriously as the architect pure and simple, for he has been ousted in turn from several important by-paths of the profession. Agricultural and sanitary buildings, like homesteads, stables, labourers' cottages, &c., have now fallen to a class of practitioners who have made them special studies. A good deal of sanitary work that used to fall to the profession is now done by sanitary engineers. Workhouses, hospitals, and schools form almost distinct branches of the profession, and have been relegated to men who have made them specialities; and then we have those who devote themselves almost exclusively to churches, theatres, factories, technical schools, and breweries. On the other side of the architect's vocation, there are those now who overlap him, like decorative artists, designers of furniture and wall decoration. Half a century ago most of these things came into the hands of architects; but, of course, they were in a much less degree specialised or organised branches than they are now. By the gradual process of division of labour, by the advance of science and scientific classification, these several kinds of work have assumed a more definite form, the consequence of which is that one kind of building is quickly differentiated from another, and, so to speak, begin to crystallise under distinct laws. So that, taking two obvious instances, a hospital and an elementary school, they are quite different buildings to what they once were. There was no idea of a well classified and equipped ward for fever or infectious patients; nor had the ideas of educating the young been brought under any kind of scientific investigation nor was there any Elementary Education Act; nor had the State taken any trouble to bring evidence together by Blue Books, the result of which has been that facts and evidence have been adduced, and the system of planning and constructing schools has been completely revolutionised. Even in such buildings as industrial dwellings and labourers' cottages, hygiene, the value of light and air and ventilation, and the physical requirements of each inmate have introduced fundamental changes. And in every case we find that directly any class of building has undergone Government inquiry or investigation as to sanitary and other matters, the door has been opened to specialists and others to enter, and what had been previously the architect's province has been given over to the engineers or another class of practitioners.

We may take two kinds of professional vocations which have bifurcated from the parent stem. They are represented by the engineer on one side, and the decorative artist on the other side. What a considerable change in the architect's profession this division has made! At almost every step the architect is now confronted by the engineer. The work of each is overlapped by the other. The design of every warehouse or shop in which iron is introduced in floors, girders, or columns, is controlled more or less by the engineer; his interference is felt in the design of iron roofs over markets, baths, theatres, and a host of other buildings. In the construction of the galleries of theatres the architect has to consult him, as also in the hydraulic machinery of the stage, in lifts, and the engineering work of baths. Certain structures like bridges and viaducts, once in the hands of architects, are now carried out by engineers. And the architect's work often overlaps that of the engineer. Modern hotels, public baths and washhouses are structures in which engineering details largely enter. And has not this specialisation of branches been productive of progress? If we lose much of the unity and harmony of the old work, we have gained precision, economy in the use of material. Our churches, hospitals, theatres, baths and washhouses are all the better for being designed by men who have devoted their experience and study to them. They move in a more restricted sphere, but they are more likely to achieve success than if they dabbled with the numerous problems of the day.

But to come to our main thesis: the building trades are in frequent conflict owing to the progress made in various directions. Thus a new invention or process comes into use which lies outside the trade of a particular craft; and this process may be connected with other trades. To take a few examples. Iron pipes have come into use for sanitary purposes, which before were entirely intrusted to the plumber. The latter resents the introduction of iron for waste and other pipes instead of lead, and both the trades of the engineer and plumber complain of the interference. Furnishing ironmongers and sanitary specialists now overlap largely the duties of the plumber. Again, several new inventions have sprung into existence which are taking the bread out of the mouths of the joiners and carpenters. One instance is that of horticultural building, which is now a special trade. Here the patentee of a new process of sash construction or patent roof-glazing often supplants the carpenter and joiner; iron or steel rolled sash-bars, or some new watertight glazing interferes with both the joiner and the glazier. The maker of iron casements has also interfered with the same trade. The patentee of new window-sashes in wood is another trespasser on the joiners' trade.

Shop-fitters form a large class of tradesmen who take the bread out of the mouths of ordinary joiners by supplying internal fittings for shops. In the decorative trades the various new processes for wall-hangings and dadoes, new kinds of plasters and fabrics, have seriously overlapped the plasterer and paperhanger. Relief decoration in fibrous plaster, and materials like tiles, embossed leathers, wood-veneers, have interfered with joiners, plasterers, paperhangers, and carvers. The carpenter also has been largely ousted by the makers of fire-proof floors, who, in lieu of timber beams and double-framed floors, have introduced iron, concrete, and pottery. We may go on to mention other introductions, like machine-made joinery, ornamental brick-work, and terracotta, to show how many of the old trades are handicapped. Each tradesman claims the new process which overlaps his trade as his own, because the same material is used, or the object attained by its use belongs to him. Mr. Sidney Webb, in his new work we noticed last week, mentions several examples of the overlap between two trades, notably in the modern industry of iron shipbuilding, where the demarcation between the trades of plumbers, engineers, and fitters and others cause many disputes. He points to the disastrous chaos into which the disputes about demarcation threw the great industries of Tyneside between 1890 and 1893, which involved the stoppage of large establishments and the idleness of thousands of artisans. The principle that every trade shall have the right to earn its bread without the interference of outsiders appears a just one, and is guarded by every trade. These disputes arise often from the custom of subletting portions of the work of a specialised kind, thereby depriving the ordinary tradesman of his work. But it is difficult to fence off every craft from encroachment. To define the right to a trade is almost impossible. Some new process or unfamiliar material is the bone of contention. The example given by Mr. Webb can be easily applied to a building. The shipwright claims the right to all that concerns the construction and fitting up of a ship. "But the modern ship includes everything that is found in a luxurious hotel, and the

shipwright, on this interpretation, would not only have to work in steel as well as in wood, but would also have to be an accomplished engineer, boilermaker, brass-finisher, plumber, joiner, cabinetmaker, polisher, upholsterer, decorator, and electric-light and bell-fitter." He observes, the dividing line between these crafts cannot be determined by the tools or the materials used. The modern steamer requires the use not only of the tools used by the shipwright, but also of those employed by the other trades, so that if each tradesman were limited to his own tools much confusion would be created—each workman would be waiting to do his particular part, and there would be overlapping or omission, in many cases prejudicial to the integrity of the structure. And this is what takes place in building. Custom has prescribed certain tools and materials; but if a specialist introduces any new process or material much anger is expressed if the work is sublet to him. As a matter of fact, it is difficult to find a dividing line between trades in these days. Progression makes it impossible to define any line of sharp definition. Materials used, or thickness of stuff, or limits of size of iron pipes, cannot be made the basis of marking off one tradesman from another. There seems only one remedy, and that is mutual agreement between the trades. The employer also, by deciding which workman to employ on a particular work, has it in his own hands to make special terms and rates.

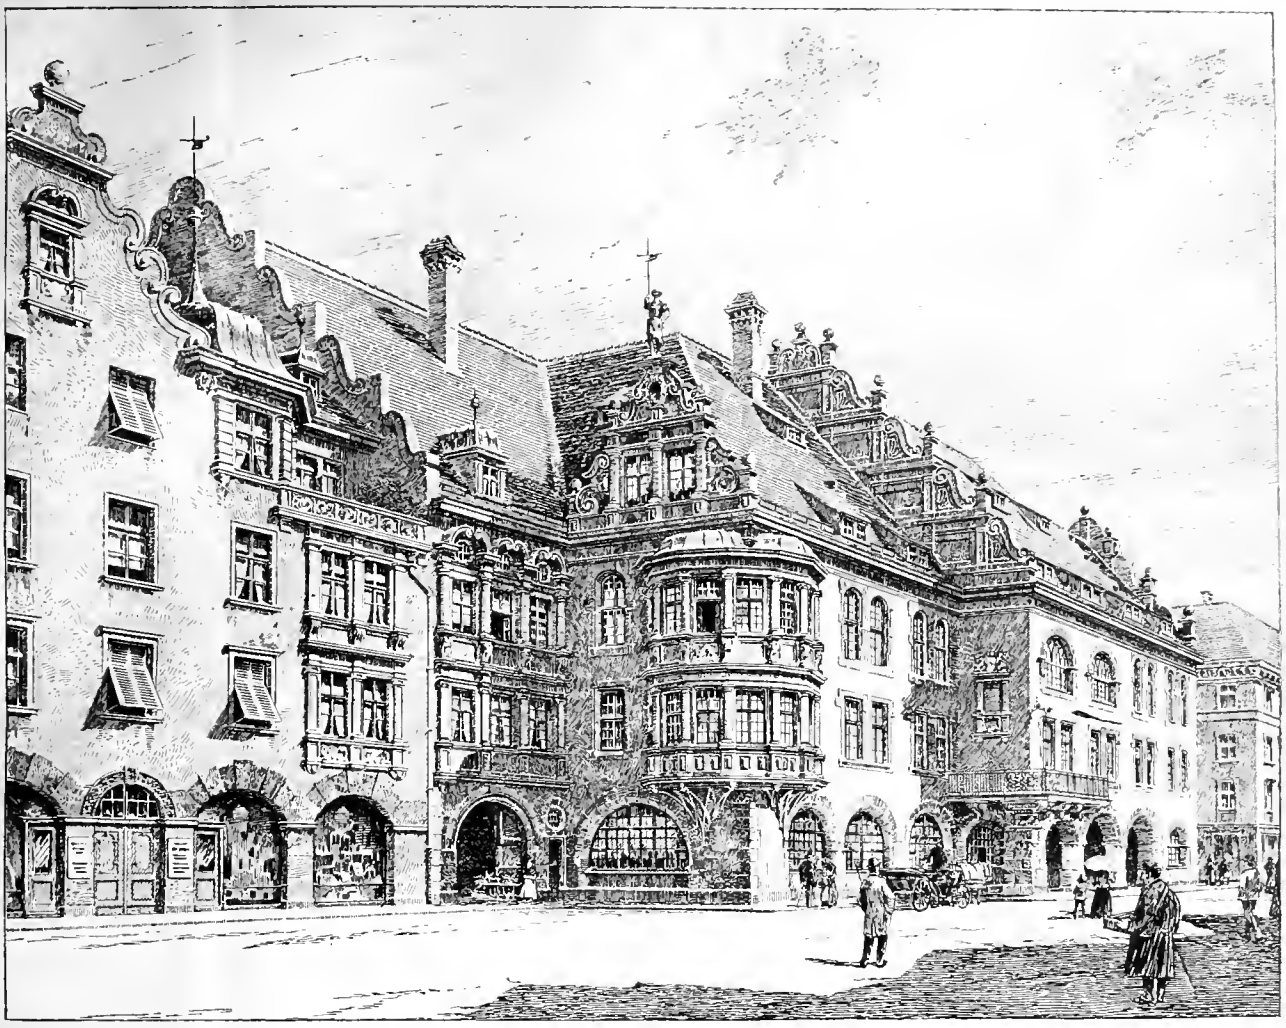
In the decorative branches of craftsmanship the architect is deprived of a good deal of his own work; he is confronted with a host of designers of furniture and decoration which properly belong to him. The sculptor or modeller was once united to the architect, so was the decorative artist; now all these alliances have been broken, and distinct men practise them. Real progress has been retarded by this division, and there is much overlap. The decorator is invited to make a scheme of decoration quite independently of the design of the building, which disagrees with the architect's labour. We have even heard of the design being altered to suit the taste of an "art faience" manufacturer, and decorative joinery introduced of a style quite different to that of the building. But then it will be said that an architect is too busily engaged with building operations and other matters to undertake these artistic finishes, and that the extension of his professional duties has made it impossible for him to undertake decoration. Unhappily, this is so: hence we find the decorative part of architecture divided more and more among outside crafts. Specialisation has produced precision, but it has destroyed unity, and it is for the architect to try and recover the threads which formerly ran through his entire art, and made decoration the outcome of the structure.

THE MILLAIS PICTURES AT THE ROYAL ACADEMY.

THE winter exhibition just opened at the Royal Academy is a pleasing variation on the works of the Old Masters, and is, both in subject and interest, one of the strongest we have seen brought together. It was a happy thought to commemorate the genius of Millais by collecting his chief works, and the exhibition now on view is thoroughly representative of the genius and versatility of the late illustrious President of the Academy. Since Sir Joshua Reynolds and Gainsborough, no master has been so felicitous in the portrayal of feminine grace and beauty under various conditions, and like the works of those illustrious painters, Sir John Millais had the rare gift of imparting to his models a poetic charm. In the preface to the catalogue we are reminded that John Everett Millais was a native of Southampton, whither his family seems to have come originally from Jersey. When only 11 years of age he was admitted a student at the R.A., and in 1847 obtained the Gold Medal for an historical subject. A year afterwards he became associated with the Pre-Raphaelite movement, and in 1849 he exhibited "Isabella" (No. 23), a work imbued largely with this feeling of art. It is in Gallery I., and has been lent by the Corporation of Liverpool. The picture "Lorenzo and Isabella," as it is there called, illustrates the family of Isabella and their dependants at dinner, suggested from Keats's poem. There is a pre-Raphaelite drawing and feeling in the figure of the loving brother and sister where Lorenzo is offering Isabella an orange on a plate, and the quaintly-attired servant behind. The head adorned by long twisted hair down the back, the close-fitting garment, and the almost archaic lines of the faces and drawing of attendant, and the brother opposite who is trying to kick the greyhound which affectionately rests his head on Isabella's lap, have a quaintness and charm of their own, and this same character is seen in the long line of faces on both sides of the table, and the light wall hanging in the background. The colour and handling, too, illustrate the same art phase. From this period of his art career down to about 1862 we find his works tinged more or less with it. The rich colour in "Cimon and Iphigenia" (3), lent by J. H. Standen, shows brilliancy and richness of colour in the group of advancing figures, and marks the beginning of the Rossetti influence. There is also a Pre-Raphaelite minuteness and technique in the picture of a wounded officer and his wife and children (8). The drawing and grouping the playthings of the children, Noah's ark figures, are wonderfully free from conventional rules; also in the next very reposeful and beautiful subject, "The Vale of Rest" (1855), from the National Gallery of British Art: a convent garden, with two nuns, one throwing in the earth in a new-made grave, and the other seated, with sweet serenity on her face, her hands clasped in quiet thought. The green sward, the dark trees, and bell-cot standing out against a light evening sky, are painted with consummate skill and vivid reality, a crowning work of the first period. So, too, in the well-known picture, "The Rescue" (10), where a fireman is descending the stairs of a burning house, carrying three children to their mother, who kneels on the stairs to clasp them. The burning flakes which fall thickly, the red glow of the fire on the little boy's uplifted face as he is brought down, are familiar to all. Other well-known pictures in this room are "The Black Brunswicker" (1860), where an officer in this corps is about to open the door of a room; but his wife, in white satin, holds the handle, and is trying to prevent his going; a dog beside her. "The Order of Release" (25), where a Highlander with arm in a sling embraces his wife, his face on her shoulder. The sleeping child in her arms and the faithful collie are touching incidents. What shall we say, also, of the charming child studies, taken from the artist's own children, "My First Sermon" (26) and "My Second Sermon" (20), very real, and true to nature; "The Ransom" (30), "The Martyr of the Solway," "Asleep" (22), "Stitch, Stitch, Stitch!" (a wan-faced sempstress), "The Parable of the Tares," and the beautiful subject-portraits of "Stella" (6) and "Vanessa" (12).

"The Woodman's Daughter," lent by Lady Millais, illustrating a stanza of Mr. Coventry Patmore's poem, is an Early Pre-Raphaelite picture in drawing and colour. Next to it, "The Minuet" (31), a delightful figure of a little girl in red dress and muslin apron, holding her skirt preparing to dance, is a well-known subject. A full-length painting of a lady in Eastern robe, representing Esther in her royal apparel in the inner court of the king's house, is very refined in colour. One of the finest of this master's Pre-Raphaelite pictures is "Christ in the House of His Parents" (57) or "The Carpenter's Shop," painted in 1850, and lent by F. A. Beer. The scene is the carpenter's workshop, familiar to many connoisseurs. The Virgin kneels beside the child Christ, who has torn His hand on a nail. St. Joseph bends over the bench, turns the hand back to show the wound, and St. John, a lad, brings a bowl of water. St. Anne, on the other side, looks at the hand. The execution of this fine interior combines all the higher qualities of the school—minute drawing and arrangement and intensity of reverential feeling. The "Proscribed Royalist," an incident of 1651, painted in 1853, is well-known and popular from engravings. Time has done little to rob it of its beauty. One of the more remarkable works of this painter is "Sir Isumbras at the Ford" (1857), lent by M. R. H. Benson. The composition represents an aged knight in golden armour crossing a river, with his helmet slung at his side, on a black horse, holding a little girl in front, and a little boy behind with a bundle of sticks. The idea is taken from an ancient romance. Everyone is familiar with the popularised subject "The Huguenot" (1852), lent by T. H. Miller, representing a young man refusing to wear the Roman Catholic badge which a lady in black is endeavouring to tie round his arm on St. Bartholomew's Day—one of the familiar figure-subjects which have been reproduced in many forms. Here we see, too, Millais's "Escape of a Heretic," dated 1857—a Spanish lover disguised as a monk rescuing his mistress, already robed for the *auto-da-fé*—a clever piece of painting; also some charming figure-subjects, "The Gambler's Wife" (54), "A Widow's Mite" (39). There is a strong resemblance between the faces of these two. The charming subject, "Autumn Leaves," a group of four girls round a burning heap of dead leaves; "Pomona," a little girl in white dress and mob cap and blue sash, holding a red apple in an orchard—a beautiful study of childhood; also a little girl holding the flower of a Speedwell, which gives its name to the picture (43). "The Blind Girl" (56), with a child sitting on the edge of a sunlit meadow, with rainbow in the sky, is another well-known picture, lent by the corporation of Birmingham. The small Pre-Raphaelite subject from Tennyson's verse is delightful in technique: "Mariana in the Moated Grange" represents the lady standing before a blazoned casement with her embroidery frame. The rich sapphire blue of her velvet dress is set off by a jewelled waist-belt; the rich colour and accessories are in keeping with the Mediæval sentiment.

In the large gallery we meet with several important pictures, many of them familiar through former exhibitions. Lord Armstrong's "Jephthah" (98), the incident recorded in Judges xi. 35, where he is seated in a chair, his head bowed down; the charming group of figures in "An Idyll," the noble group of firs against a light sky (103), and the much-admired picture of "Chill October" in Lord Armstrong's collection; the corporation of Manchester's landscape, "A Flood," showing flooded meadow and a floating cradle with child, and a black cat, are delightful examples. If proof were wanted of Millais' skill in landscape, we have it in the beautiful view of a marshy waste, "Murthly Moss," painted in 1887, with its delicacy of drawing and colour and tufts of reeds, and in the "Dew-Drenched Furze," lent by Mrs. Sandars. Of subject pictures, we may briefly notice "Speak! Speak!" exhibited at the Academy in 1895, now in the National Gallery of British Art, in which a beautiful white-clad spectral figure of a lady startles an awakened man; "A Yeoman of the Guard" (1876); "Yes!" a lady in evening dress speaking to a gentleman in travelling



VIEW FROM THE PLATZL, KGL. HOFBRAUHAUS, MUNICH.

MESSRS. HEILMANN AND LITTMANN, *Architects.*

dress in the portico of a house; "Rosalind and Celia" (102), and the well-remembered subject "The North-West Passage" (1874), an interior where an old sailor is describing to a girl in white dress, who sits at his feet, his arctic journey; and the dark and weird picture illustrating Keats's "The Eve of St. Agnes," painted in 1863, now in the possession of Val. C. Prinsep, R.A. The beautiful portrait studies of "Lady Peggy Primrose," a fair-haired child, the pretty group of children in 107; portrait of "Nina" (111), a fair-haired little girl seated on a green earthenware pedestal in white and bluish-greens, with a tired look in her eyes; the stately portrait of Mrs. Bischoffsheim (113), the portrait of John Bright, of Mrs. Caird (115), of J. C. Hook, R.A., of H.R.H. the Princess Marie of Edinburgh, now the Crown Princess of Roumania (120) are worthy of this master of portraiture. The delightful idealised studies, "For the Squire," "Sweetest Eyes, &c." (118), "Forget-Me-Not," "The Nest," "Cuckoo," are extremely sweet studies of children, full of life and beauty, as only this master of character and expression can depict—perfectly natural, yet imbued with a grace that takes them out of the commonplace. Gallery IV. has one or two large landscapes. "The Fringe of the Moor" (147) has a sunny open-air effect, "Lingering Autumn," and the well-known picture, "Princess Elizabeth in Prison," with the elaborate Elizabethan oak cupboard behind (148); "The Ruling Passion," lent by Lady Millais; the popular "Bubbles," "Puss in Boots," "Cherry Ripe" (169), "New Laid Eggs," and other studies of girlhood. The other galleries and the water-colour room are full of pictures and studies representing every period of this great painter's industrious career, and worth the study of every admirer of painting.

THE TAXATION OF LAND VALUES.

A CONFERENCE was held in Bradford on Tuesday on the subject of the taxation of land values, at which delegates were present from all parts of Great Britain. Mr. W. P. Byles, who was in the chair, said that the time was ripe for the taxation of land values. Scotland had led the way. It had converted the great municipality of Glasgow. They in Scotland had secured the support of 62 Scotch assessing authorities, and had moved Parliament in the matter. Wales had done likewise, and everyone knew Ireland's appreciation of the blessings of the land monopoly.

A discussion followed on a resolution to the effect that the true basis of national and local taxation was not labour and the product of labour, but the value of land due to the activities and necessities of people.

Mr. Isherwood (Bury) moved as an amendment that land, whether occupied or not, should be taxed for all purposes at the full actual value from time to time, and delegates from Gateshead Union supported this.

Dr. Clark, M.P., said they should firmly express the opinion that they should change the taxes on labour and products of labour to taxes on land values which would be sufficient for all local and Imperial purposes.

Mr. R. M'Ghee, M.P., contended that legislation in that direction would set free the true sources of production to those willing to produce. He believed this would solve the labour problem.

The resolution was carried with ten dissentients.

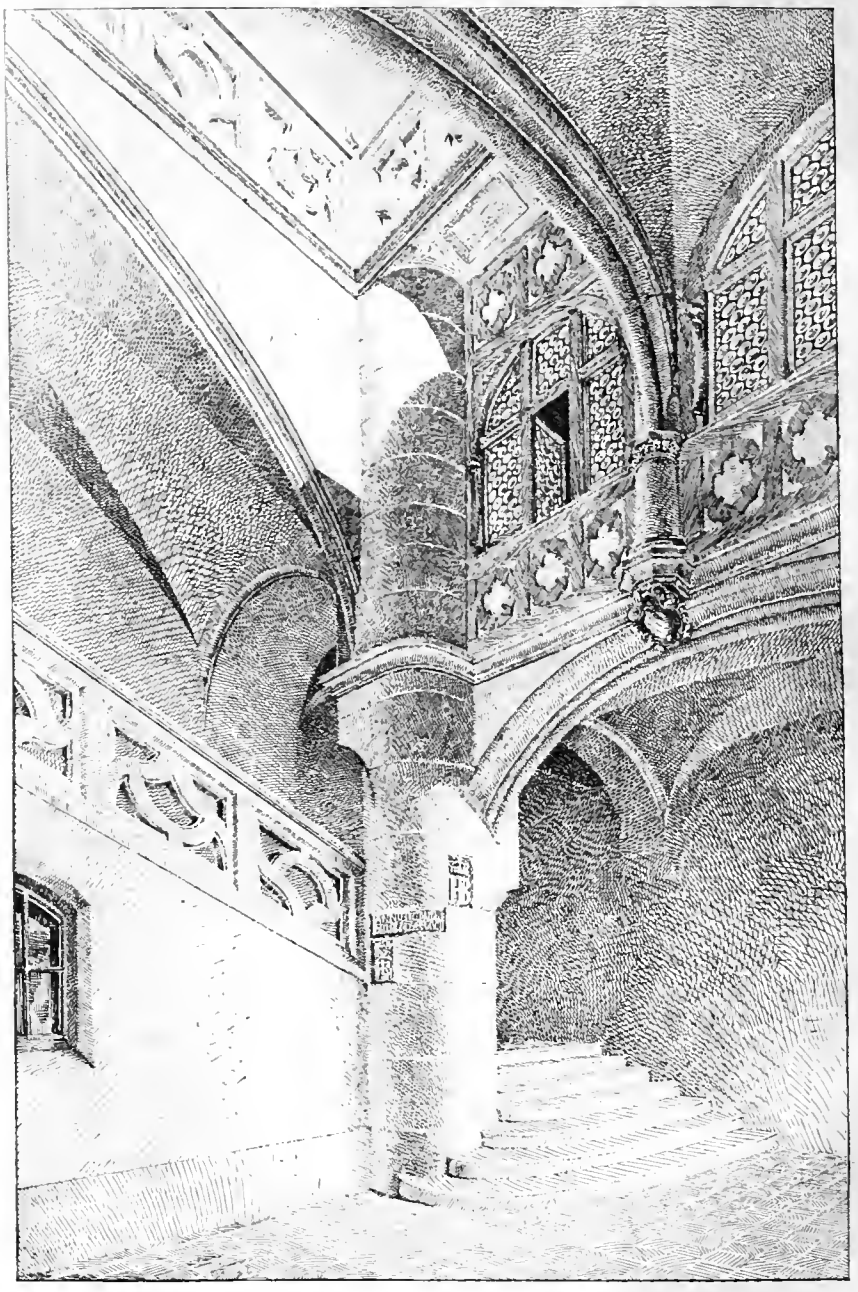
Mr. E. Adams (Edinburgh) proposed a resolution demanding separate valuation of land apart from improvements and assessment of taxes on the full true annual value of land, whether used or held idle. This was carried unanimously, and a long discussion took place on a proposal not to vote for Parliamentary candidates who did not pledge themselves to the principle of the taxation of land values. The resolution was lost by 35 votes to 33. Another resolution passed demanded the power for local assessing bodies in Britain to rate the value of land for local purposes.

ACADEMY ARCHITECTURE, 1897.

THE second volume of Mr. Alex Koch's annual architectural review was published just before Christmas,* and by the courtesy of the editor we are enabled to-day to present our readers with three typical illustrations, chosen from the foreign works therein represented among the works of the year. All the reproductions are extremely well done, and are printed on highly glazed paper in excellent style, so that although in many instances the reductions have necessarily been considerable, the results are highly satisfactory and clearly executed. The book contains a goodly number of drawings shown at the Royal Academy in 1897, but which could only be borrowed for photographing after the close of the exhibition in August. Among the English contributors we may mention the following well-known architects:—Messrs. Aston Webb, Ernest George, E. W. Mountford, Maurice B. Adams, John Belcher, W. D. Caröe, G. H. Fellowes-Prynne, among others. A comprehensive choice of the best things done during the year are thus brought together in the two volumes produced by Mr. Koch, and are thus preserved in a very handy form for reference. The scale of the plates in so compact a

* Academy Architecture and Architectural Review, 1897. Vol. XII. Edited by ALEX KOCH, Architect. London: 58, Theobald's-road, W.C. 4s. net.

folio is, of course, much smaller than the reproductions which we are enabled to give from time to time from the same subjects, but the advantage of collecting the drawings thus together is patent to anyone. Added to the drawings of architecture are some photographs of sculpture from the Academy and the Royal Scottish Academy Exhibitions, as well as from Berlin. Among these last is an exquisite statue by Mr. Walter Schott, of Berlin, representing a "Girl Playing at Ball." The same artist had a nude rendering of the same figure in the same exhibition, which was excellent, but we think, on the whole, preference will be accorded to the draped figure, which we herewith illustrate. The principal staircase from the Kgl. Hofbrauhaus, Munich, is shown by a clever line drawing by the architects, Messrs. Heilmann and Littmann, whose work in some ways is quite Mediæval in the spirit of its design. This is noticeable also in the exterior view of the same building as seen from the Platzl, which we also print with these notes. We cannot admire much of the modern Continental work; but Dr. P. J. H. Cuyper's churches present an excellence all their own. Illustrations are given of his Church of the Sacred Heart at Tilburg, and St. Jacobus, St. Gravenhage, two notable instances of his brick buildings. The Exhibition buildings at Stockholm, by Mr. Gustaf Wickman, are among the plates of interest; and the Town-hall, La Plata, by Professor Hubert Stier, of Hanover, may be named for its scale and importance. A model of the same architect's design for a Provincial Museum in Hanover is likewise illustrated. The curious extravagances of modern German taste is represented by the interior of the Restaurant "Zum Heidelberger" Central Hotel, Berlin, by Mr. Wilhelm Walther, architect, who has done a picturesque and extensive group of buildings—the Schloss Freund Kurfürstendamm, Berlin.



PRINCIPAL STAIRCASE, KGL. HOFBRAUHAUS, MUNICH.
MESSRS. HEILMANN AND LITTMANN, *Architects.*

EFFECT OF SEA-WATER ON CAST IRON.

IT may not be generally known that under certain conditions cast iron will resist the corrosive action of combined oxygen and water, or of carbonic acid and water, better than either wrought iron or rolled steel. This comparative immunity of cast iron to deterioration relatively to the two other forms or varieties of the same material, only obtains so long as when emerging from the loam of the foundry, or from the jaws of the rolling-mill, the natural surface of each description of metal is kept intact. If the "skin," as it is termed, be once broken, the relations between the three are reversed, and the cast iron corrodes with much greater rapidity than the two others. This difference becomes very considerably accentuated if all the surfaces be planed or sheared, or treated in any manner which would impart to them a bright polished appearance. It is a little curious that similarly to certain kinds of timber, cast iron corrodes more quickly when exposed to successive alternations of humidity and acidity, or when, as frequently occurs, there is but a thin layer or *couche* of moisture on its surface. If plunged deep down in either salt or fresh water, it will last a good deal longer. That this breaking of the skin is not a mere fanciful idea, was abundantly demonstrated by the experiments undertaken some years ago upon the fracture of cast-iron bars. A very slight application of the chisel or the file, although the result was little more than a mere scratch, was sufficient to break the skin of the iron, and very appreciably diminish its powers of resistance. It can be readily understood, arguing analogically, that the skin, acting as a protection to the material, once being removed, either partially or *in toto*, the way is cleared for the deleterious influence of salt water, or of any other corrosive agent.

The question of time has a very intimate and important bearing upon our subject, and though no doubt some valuable information has been obtained with respect to the behaviour of cast iron after long immersion in sea-water, yet it is by no means of an altogether satisfactory or conclusive character. It should be borne in mind that the composition—that is, the particular quality of the metal—very materially restricts or prolongs its durability in salt water. It is, therefore, no absolutely conclusive test of the resistance of cast iron to the deteriorating action of the sea, that some specimens in the form of piles, columns, and other component parts of cast-iron piers and jetties built in salt, or even fresh, water have not lasted as long as they might have been expected to do. Compared with other examples, which have survived under the same circumstances ever since they were first immersed, the reason for the superior longevity of the latter is that the quality or description of material was better adapted for the purpose. The same facts hold good for steel, for experience has shown that manganiferous steel is much more corroded by the influence of sea-water than when the percentage of that ingredient is almost inappreciable.

Some further light has been thrown on this interesting question by some analyses conducted in the laboratory of the French Government at Brest upon specimens of cast iron, which have rested long enough at the bottom of the sea to afford excellent data for a full consideration of the whole matter. The specimens investigated were cast-iron shells which had laid in the harbour of Brest for a period ranging from 100 to 150 years. Outwardly there was little or nothing to indicate that any material change had taken place in their molecular or chemical constitution, except that their weight was manifestly much less than it would have been for the same volume of a similarly new projectile. That searching and unimpeachable agent, analysis, revealed, however, after a brief examination, that the metal, although not so completely changed as to be unrecognisable for what it really was, had undergone many and serious modifications. All its usual physical properties had disappeared. It no longer possessed any tenacity, cohesion, elasticity, or hardness, and was clearly utterly worthless for the future as a missile of warfare. When submitted to the microscope, a section of the old shells presented a loose and rather fragile kind of texture, full of holes surrounded by a greenish tint, a sure indication of a very rapid and decided oxidation of the metal. Chemically speaking, there had been a considerable reduction in iron and a corresponding increase of carbon, the latter replacing as it were the former. Since the specific gravity of cast iron may be taken on the average at 7·55, and that of carbon at 3·52, the loss of weight is at once explained. No doubt the same causes which brought about the alteration in the material of the shells are equally actively at work in other cast-iron work placed under similar conditions: but it must be borne in mind that the quality of the metal used in casting shells a century and a half ago was not of a very high class. Having regard to the excellent quality now employed, suitable for every description of purpose, and varied accordingly, we should not be justified in assuming that the fate of the shells will befall our cast-iron structures erected in sea-water. T. C.

A new organ is being erected in the parish church of St. Peter, Salterton, near Exmouth.

GIRL PLAYING AT BALL, BERLIN EXHIBITION, 1897.
MR. WALTER SCHOTT, *Sculptor.*

SANITARY INSPECTORS' ASSOCIATION.

SIR JOHN HUTTON (the president) delivered his New Year's address to members of this association on Saturday at Carpenters' Hall. He said it had long been the wish of those interested in the association to form a fund from which members could be encouraged in their studies and researches in the interest of the public health. A practical proposal had now been made by one of their members to found a Chadwick and Richardson memorial fund. This offer was a contribution of 50 guineas, provided that, within nine months, the fund were raised to 500 guineas. The competitions for prizes would be held yearly in such form as might be deemed best, either by having special competitions, or for the best papers read at London or any of the branch meetings. To promote longevity was an aim and result of the work of the sanitary inspector. In 1660 the rate of mortality in London was 80 per 1,000 per annum, but the death-rate in the county of London in 1896 was only 18·9. Many contributory causes must have operated in producing this result, not the least of which he claimed, in recent years, to be the zealous labour of the sanitary inspector. The present death-rate of 18·9 per 1,000, light as it was, could be still further reduced. Cleanliness was an immense factor in all practical sanitary work. Filth was the parent of disease, both among individuals and communities. The question of the purity of the water supply to London would, he hoped, secure the early attention of thoughtful people. Referring to the numerical strength of the association, he said that at present it had 670 members, including 52 honorary members and 26 associates. On the motion of Mr. T. G. Dee (chairman of the council), seconded by Mr. W. W. West, a vote of thanks was accorded to Sir John Hutton for his address.

At Beddington Corner, Mitcham, on Saturday, Jan. 1 the foundation-stone of an isolation hospital for the Croydon Rural District Council was laid. The buildings will comprise an entrance lodge, administrative block with accommodation for doctor, matron, nine nurses, and six servants; three ward blocks with accommodation for twenty-eight patients, mortuary, discharging-room, and stables; laundry and disinfecting block. The architects are Messrs. R. M. Chart and Son, of Union Bank Chambers, Croydon; and the contractors are Messrs. D. Stewart and Sons, of Wallington, the amount of their contract being £15,878.

OBITUARY.

MR. CHARLES KING BEDELLS, F.S.I., of Toft Lawn, Hornsey-lane, and 1, John-street, Bedford-row, died very suddenly on Friday last, aged 66 years. It appears that he had just completed the survey of a house with his son, Mr. C. Herbert Bedells, and was about to leave. Mr. Herbert Bedells went forward to open the door, when his father was attacked by syncope, and fell down the stairs; when picked up, life was found to be extinct. Deceased was the senior partner in the firm of Lander and Bedells, land surveyors, and had an extensive practice; he was well known as an authority on questions of easements and party-walls. He had been a Fellow of the Surveyors' Institution since January, 1879, and for many years past had been one of the senior deacons at Park Congregational Chapel at Crouch End, of which the Rev. Alfred Rowlands, LL.B., is pastor. The funeral services were held in that chapel on Wednesday afternoon, and were very largely attended.

CHIPS.

Messrs. Ashwell and Nesbit, Limited, have sent us one of their useful and well-designed date-cards, which will doubtless find a place on many office walls.

The additions to the Infectious Diseases Hospital, Morton Banks, Keighley, are being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves with descending smoke-flues, and Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Jews of the East-end of London have presented his portrait to Sir G. Faudel-Philips, as a recognition of the manner in which he had discharged the duties of Lord Mayor of the City during the past year. The portrait was painted by Mr. Solomon J. Solomon, A.R.A.

Mr. George B. Post is the designer of the plans approved and adopted for the College of the City of New York, and has been appointed architect of the building by the Board of Trustees. Plans for the building, which, it is estimated, will cost 500,000dol., were requested from eight architects, and each is to receive 350dol., except the one chosen to execute the work.

The National Gallery has purchased from Messrs. S. T. Smith and Son, of Duke-street, a "Portrait of the Artist at the age of 18," by Mdlle. Vigée, afterwards Mdme. Vigée-Lebrun. The picture will not be on view for a short time.

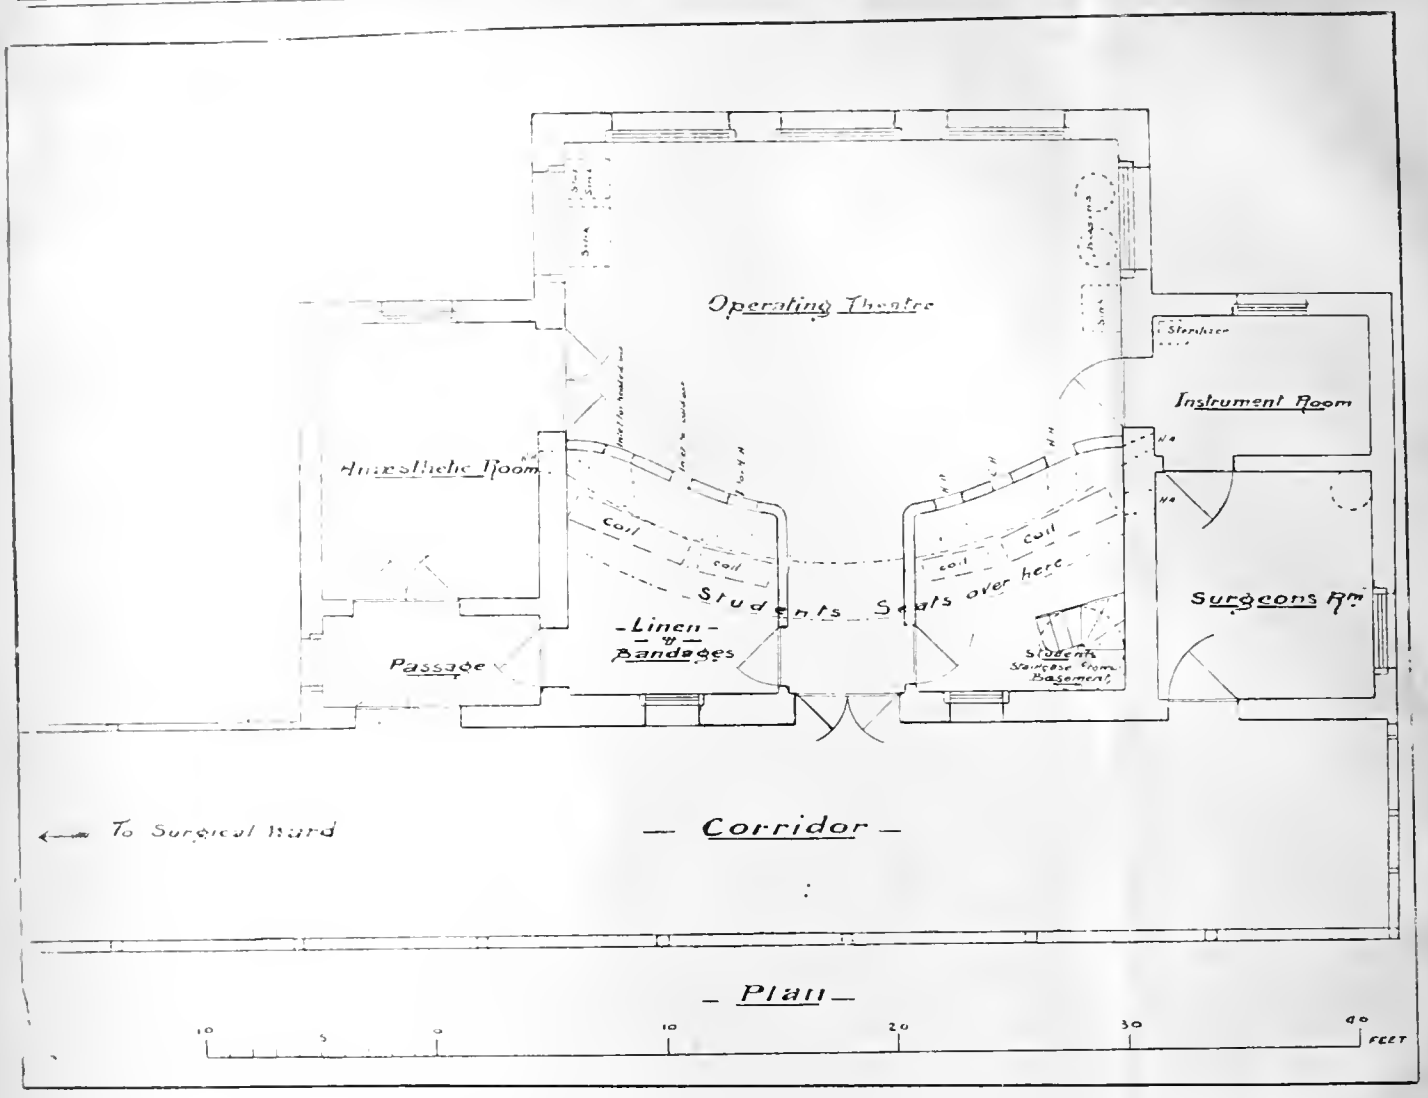
On Saturday the new public hall at Cambuslang was opened with an art and industrial exhibition. The premises include a library and reading-rooms, recreation-rooms, and public hall, and have involved a total outlay of £5,000. The public hall is 76ft. in length, 40ft. wide, and 30ft. high, and lavatories, and cloak and retiring rooms are provided.

The annual report of the Queensland Railway Commissioners covers the operations of 2,389 miles of line, an increase of 116½ miles for the past year. The capital was increased during 1897 by £1,514,480 and the railway fund now amounts to £20,308,632.

The parish church of Kilwinning, which has been closed for some time, owing to extensive alterations and repairs and the introduction of a new organ, was reopened for worship on Sunday.

Mr. Richard Garnell, of 21, Belmont-avenue West, Belfast, sends us some specimens of a new detective envelope which he is introducing, and which certainly more effectually checkmates inquisitive and dishonest people than any other contrivance of the sort we remember. It is very simple, but well worth the attention of business firms sending away small sums by post, and by others who prefer that their private correspondence should remain private. The ordinary appearance of the envelope is not altered, and it is not troublesome to open, as are some of the similar efforts that we remember have taxed our patience in the past.

At North Leigh Free Church, on Friday, a tablet and medallion to the memory of the late Rev. Dr. Robert Macdonald (1813—93) was unveiled by Lady Grainger Stewart, a daughter of the deceased. The sunk portion of the tablet is of white marble, while the outer bordering is of Sicilian marble. The medallion is placed in the centre of the tablet in profile, and is life-size. The style of the tablet is Early English Gothic. Underneath the tablet is a brass plate bearing an inscription. The medallion was executed by Mr. D. W. Stevenson, R.S.A. A new organ has been built in the church by Messrs. William Hill and Son, London. The lower part of the organ-case, which is of stained yellow pine, is in panelling, and the upper portion is in open woodwork, with mouldings and tracery. The cost of the organ is about £1,250.



NEW OPERATING THEATRE, DUNEDIN, NEW ZEALAND.

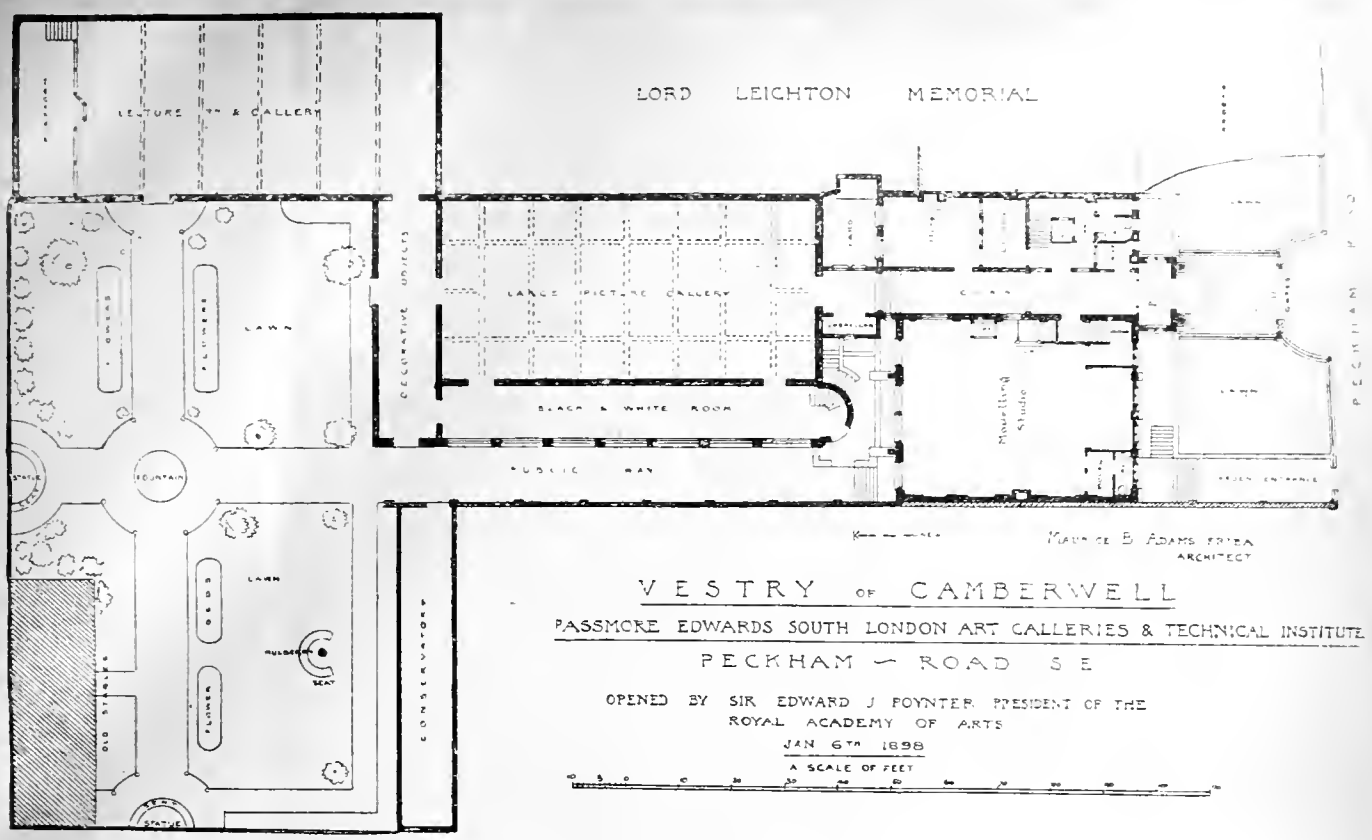
THE hospital trustees some time back decided to build a new operating theatre, and instructed their architects to prepare plans and specifications, with all the latest up-to-date improvements. It has now been completed and publicly opened, and the trustees are sanguine that it will give satisfaction to the honorary medical staff, and will prove a lasting boon to the patients. The building is placed near the surgical wing, and on the same level, the floor being 7ft. from the ground, and the whole area built over and 4ft. all round the building is asphalted. It is connected to the surgical wards by a corridor 9ft. wide, and constructed with brick on concrete foundations, and Port Chalmers stone base. The operating-room is 24ft. by 24ft., and has a gallery capable of accommodating about sixty students. There are an anæsthetic room 12ft. by 9ft. 6in., an instrument-room 9ft. 6in. by 6ft., a surgeons' room 10ft. by 9ft. 6in., and a room for holding bandages and dressings. The patients are first taken into the anæsthetic room, and thence to the theatre; there is a second doorway leading out of the theatre, by which the patients may be removed after operation. The floor of the theatre and instrument room is laid with marble mosaic or terrazzo on concrete, and polished. The walls of the theatre, 7ft. high and 4ft. in the instrument-room, are lined with opaline in large sheets, with as few joints as possible, and all angles throughout are rounded. The remainder of the walls are finished with Keene's cement, polished and painted and varnished. The opaline has a beautiful surface, and was specially imported. The students' gallery is entered from the basement. It is constructed entirely of concrete and finished in cement, and polished perfectly smooth, so that the whole theatre may be washed down with a hose, and either hot or cold water may be used for this purpose. The roof of the building is of slate, and the theatre roof is of the Mansard type, with double sashes on all sides, with green blinds fitted between the sashes, so that the light may be regulated. There are also five large windows, with fanlights fitted to open, glazed with ground plate-glass, which has a softening effect on the light, and also prevents any person seeing into the theatre from outside. The fittings are of the latest design, being imported for the purpose. In the theatre there are two sponge sinks, a slop sink, and two basins. There is also a basin in the surveyor's room. The supply and waste taps of the basins and sinks are all worked with treadle action instead of the ordinary method, this being done in order to prevent any risk of the fittings being soiled by the hands. A "Pasteur" filter has been fitted in the cistern over the instrument-room to supply filtered water for operations. In the instrument-room there is a steriliser fitted with a gas-heater. The heating-apparatus is fitted under the students' gallery. The cold air passing over the steam coils enters the theatre through louvred ventilators, so that the amount of air entering the theatre may be regulated. There is also provision made for admitting cold air direct into the theatre should it be necessary. The air is extracted from the centre of the ceiling by a galvanised iron shaft fitted with a steam coil to increase its extracting power. The lighting is at present by gas; but it is contemplated at some future date that the whole of the hospital will be lit by electricity, the motive power being obtained from the present boiler, which was provided about three years ago for supplying steam for heating and other purposes. The plumbing work was intrusted to Messrs. Corbett and Co., and has been done in a thoroughly workmanlike manner. Mr. George Morrison was the contractor for the building, the whole being designed and carried out by Messrs. Mason and Wales, architects.

The erection of the new dead meat market and abattoir, which the Leeds Corporation are about to provide, will shortly be commenced.

LORD LEIGHTON MEMORIAL, CAMBERWELL.

SIR EDWARD J. POYNTER, President of the Royal Academy of Arts, opened this group of buildings last evening, and dedicated the Arts and Crafts Institute to the memory of Lord Leighton, P.R.A., who was the first President of the South London Art Galleries. We published a view of the new building, which has been erected by the Vestry of Camberwell, from the designs of Mr. Maurice B. Adams, F.R.I.B.A., in the BUILDING NEWS for April 10, 1896, and a detail of the façade appeared in our issue for July 31 same year. It has been the munificent gift to the parish by Mr. J. Passmore Edwards, and occupies a fine site in the Peckham-road. The buildiogs, set back in a line with the adjoining houses and the forecourt lawns, have been inclosed with richly-treated ornamental wrought-iron railings and gates in keeping with the façade. The leading feature of the front is formed by the boldly projecting porch entrance to the South London Art Galleries, which are situate at the rear of the Technical Institute. A spacious hall corridor leads straight through into the big gallery, and the oak-pedimented doorway between the two buildings is fitted, like all the other doorways in the picture galleries, with fireproof folding doors.

The Institute comprises four large studios, and also the workshops for craft work, which are located in the half basement. A commodious committee-room or office is on the ground floor for the curator and art director. Retiring rooms, cloakrooms, lavatories, &c., are provided for the students, including a lunch-room for lady pupils on the mezzanine floor. A residence is provided on the premises for the caretaker and porter. A fine north light is obtained at the rear by means of very large studio windows, and these on the top floor extend well into the roof. Model rooms are furnished to the main studios with lavatories and w.c.'s to each. The big studios are 18ft. high, and in the modelling studio a gallery



extends along the south side. A through way is contrived below the ground-floor level as an approach to the public gardens at the back and for the purpose of bringing in works of art intended for exhibition in the picture galleries or for the use of the Technical Institute. A lift by Messrs. Archibald Smith and Stevens is provided from the basement to the top floor. The staircase and floors are constructed in Fawcett's fireproof steel and concrete work. Wood-block pitch-pine flooring is used for all the rooms, and encaustic antique tiles are laid in the entrance porch and corridor. The building is executed in Portland stone and Lawrence's red-brick facings, the spaces between the ground floor arcade being built with patent salt-glazed red bricks, made by Messrs. Cliff and Son. The style of the building is Renaissance, richly treated with carvings by Mr. W. Goscombe John, who also executed the sculptured pediment which contains life-size figures representing "Architecture," "Sculpture," and "Painting." The flock wall-papers, by Messrs. Jeffrey and Co., and the decorations of the galleries were executed in accordance with suggestions by Sir E. Burne Jones, Bart., and Sir Wyke Bayliss, P.R.B.A. The parquet flooring has been completed from the cartoon of Mr. Walter Crane, who designed the entire floor of the large gallery. The central panel is inlaid with the legend, "The Source of Art is in the Life of the People." The bronze memorial cartouche over the principal entrance was executed by Mr. W. Goscombe John. Mr. Nathaniel Hitch, the sculptor, did the red Belgian marble tablet in the hall. It is about 8ft. high, and is enriched by a sculpture, in the upper part, of St. Giles, the parochial saint of Camberwell. Mr. H. W. Hogan has acted as clerk of the works. The builder was Mr. Richardson. The work now done has included the re-roofing of the big gallery and repair of the old buildings, as well as their decoration, executed by the workmen employed by the Works Department of the Vestry. The gardens have been laid out from the plan of the architect. Mr. Cecil Burns is the art master, acting under the direction of the Education Board of the London County Council, of which Mr. Geo. Frampton, A.R.A., and Mr. W. R. Lethaby are the Art Directors. A splendid collection of paintings and works of art is on view in the galleries, including a portrait of Mr. J. Passmore Edwards painted by Mr. G. F. Watts, R.A., and some original drawings presented by their author, Mr. Ruskin; the late Mr. Wm. Morris's furniture, painted by Sir E. Burne-Jones, is also on view.

COMPETITIONS.

BIRMINGHAM.—A meeting of the Lunatic Asylum Committee was held on Monday at the Council House. The chief business was the consideration of the appointment of an assessor to advise the committee on the competitive plans sent in for the new asylum which is to be erected at Northfield. After some deliberation, the committee decided to appoint Mr. George T. Hine, F.R.I.B.A., of Parliament-street, Westminster, who is frequently employed as assessor by the Lunacy Commissioners.

NOTTINGHAM.—The Public Parks Committee has confirmed the report of the assessors appointed in the New Cemetery Competition, and have awarded the premiums as follows:—(A) Landscape gardening, &c.: 1st, Mr. Thomas W. Mawson, Windermere: 2nd, Messrs. Wm. Barron and Son, Borrowash, Derby. (B) Chapels, lodges, &c.: 1st, Messrs. Arthur E. McKewan, A.R.I.B.A., and Alfred J. Dunn, A.R.I.B.A., Colmore Chambers, Birmingham; 2nd, Messrs. Chas. A. Nicholson, M.A., and Hubert C. Corlette, A.R.I.B.A., Gray's Inn, London. The drawings received will be on view to the competitors and members of the city council at the Guildhall, Burton-street, Nottingham, to-day (Friday).

POSTER DESIGN.—In connection with the Art Metal Exhibition, to be held at the Royal Aquarium, London, in May and June next, designs for a double-crown poster are invited. All designs must be sent in carriage-paid, on or before February 28, 1898. They must be addressed to "Art Metal Exhibition, Poster Competition, Mr. Edgar S. Shrubsole, Royal Aquarium, London." Each design should bear a distinguishing mark or motto on the margin, and must be accompanied by a sealed envelope bearing outside a similar distinguishing mark or motto, and inside the full name and address of the designer. These envelopes will not be opened until after the judges have made their awards. The judges will be chosen from the council of the exhibition, and their decision shall be final and absolutely binding on the competitors. The designs sent in will be placed on view in the Royal Aquarium in March, 1898, and also during the exhibition, and they shall be the property and copyright of the Royal Aquarium Society. Ten guineas will be paid by the Royal Aquarium and Summer and Winter Garden Society, Limited, for the design selected by the judges as the best. Any competitor may send in any number of designs, but each one must be sent separately, and must bear a different distinguishing mark or motto. All designs must be full size—viz., 30in. by 20in.; the lettering to be embodied is: "Art Metal Exhibition, Royal Aquarium, London, May—June, 1898." A blank space must be left at the bottom of the poster not less than 2in. in depth; this space is for the purpose of announcing different railway arrangements, &c. It will be permissible to introduce a figure in the design if the competitor think fit. Each design must be drawn on stout paper, and be either mounted on a stiff cardboard, or be backed by linen and mounted on a wooden-framed strainer, a margin in any case to show all round the drawing.

SOLDIERS' AND SAILORS' MONUMENT.—The United States National Sculpture Society, having been called in to judge the designs submitted for the Soldiers' and Sailors' Monument of Hudson County, New Jersey, has made, through the committee appointed to examine the models, a report, which places first the design by Philip Martiny, sculptor, and Ackerman and Ross, architects, and recommends its adoption. The second place is awarded to the design by Charles H. Niehaus, sculptor, and Henry Bacon, architect; and the third to that by J. Massey Rhind, sculptor, and Arthur D. Pickering, architect. Thirty-nine designs were offered in competition, and the committee speaks highly of their general excellence and interest.

SOUTHEND-ON-SEA.—In the competition for a district church of St. Alban at Southend, Essex, the assessor, Sir Arthur W. Blomfield, A.R.A., has placed the design submitted by Messrs. Nicholson and Corlette, of 28, Theobald's-road, W.C., first. The selected architect will proceed with the work as speedily as possible.

The Natal Government have appointed Mr. M. W. Carr, M.Inst.C.E., to the office of consulting engineer to the Agent-General for the colony in London.

The lengths of the railways open for traffic in Western Australia at the end of June, 1897, were as follows, viz.:—Eastern Railway—Freemantle to Kalgoorlie—including Perth Racecourse, Newcastle and Beverley branches, and Mahogany Creek deviation—455 miles; South-Western Railway, including Canning Racecourse, Donnybrook, and Busselton branches—165 miles; Great Southern Railway—Beverley to Albany Jetty—243 miles; Northern Railway—including Walkaway and Mullewa branches—109 miles; total mileage, 970 miles. Increased mileage during the year, 382; twenty miles of double line and 950 miles single line.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR at the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 32fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Correspondence.

WALTHAMSTOW BATHS COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—So far as I know, Messrs. Spalding and Cross, although they were paid the second premium of twenty-five guineas (not yet returned), have never exhibited any interest in the amount to be paid me by way of compensation.

I have been offered the paltry sum—under the circumstances—of £100, subject to the approval of the Local Government Board. The matter is now, I believe, under consideration by that authority.—I am, &c.,

J. WILLIAMS DUNFORD.

100c, Queen Victoria-street, E.C.

CARDIFF COMPETITION.

SIR,—Mr. Matear deserves the thanks of his fellow-competitors, and as one of such, I confirm his objections to the selected design. I could add many more objections; but one shall suffice. The police department was ordered to be to the north of the law courts; but on the south frontage we find the main portion of this department. *Le passant*, is it advisable to cut this department in two by the cell corridors?

It may interest Mr. Matear to know that the workshops for weights and measures department he fails to find are located on the second floor—surely a great mistake, and very inconvenient for access for heavy weights, scales, &c. The conditions insisted on this department being on the ground floor.

Mr. Waterhouse only occupied two or three days in adjudicating on the 76 designs. Less than half-an-hour for each design! This is a poor return for the three or four months' hard work of competitors.

To sum up, it would appear that Mr. Waterhouse has arrived at a hasty and unsatisfactory decision. If, as is probable, he put aside those he considered contravened the conditions on the question of cost, surely he ought also to have rejected those who broke the conditions in other ways.

The old-fashioned way of settling a competition would appear to be the best—*i.e.*, give the award to the best plan and leave the onus of proving the cost to the competitor, or, on the other hand (as Mr. Waterhouse did at Birmingham when placing Mr. Lynn's design), award the premiums, and then state which is absolutely the best plan and design. Then the corporation would have the choice, and would then have an opportunity (as is denied them in this instance) of having a really good plan and design.

I would ask Mr. Waterhouse if he verified the cubical contents of each design, as is most important, as will be seen from the following instance. In a late competition my design (although admitted by the assessor to be superior to those he selected) was rejected on account of alleged excess of cost. After the competition was all over and the scheme abandoned, the borough surveyor, who made an independent calculation, discovered that the cubic contents of the design placed first was much understated, and, in fact, greater than mine!—I am, &c., NEMO.

CHIPS.

Mr. E. Bailey Denton, M.Inst.C.E. (Bailey Denton, Son, and North, of Palace Chambers, Westminster), has taken Mr. G. Maxwell Lawford, Assoc.M.Inst.C.E., President of the Society of Engineers, into partnership, and the firm will henceforth be known as Messrs. Bailey Denton, Son, and Lawford.

The premises of Mr. A. J. Beaven, builder and contractor, Dear-lane, Bedington, Bristol, were destroyed by fire on Friday night. The damage is estimated at over £5,000.

Mr. H. J. Stannard, a stone merchant, who lived at Stanley Villas, Combe Down, Bath, died, on Tuesday, after a short illness at his residence. Deceased, who was over 70 years of age, had been a member of the Monkton Combe Parish Council since its first election. He was a large employer of labour.

The Manchester City Council, at a meeting on Wednesday, adopted a recommendation from the improvement committee to apply to the Local Government Board for a loan to carry out an extensive scheme of municipal lodging-houses. The project is to provide accommodation for persons displaced by extensions of the markets, and will form one of the several corporation colonies in and around the city.

The will of Mr. Henry Carpenter, of 133, Marina, St. Leonards, and formerly of Essex Villas, Kensington, architect, who died on November 13, has been proved by Mrs. Rebecca Carpenter, the widow, and Mr. Arthur Carpenter, of 11, Queen Victoria-street, the son, the executors, the value of the personal estate being £613 16s. 5d.

The hall built by Sir Oswald Mosley, Bart., at Rolleston, Burton, in commemoration of the Queen's long reign, was opened a few evenings ago. Mr. Eaton, of Derby, was the architect, and Mr. Kershaw, of Burton, the builder.

The new parochial hall and schools at St. Mary's, Bearwood, were opened on Friday by the Bishop of Lichfield. The building, which is of brick, stands contiguous to the church, and comprises a hall, with accommodation for 300 people, and two classrooms. The cost has been £1,815. The contract has been carried out by Messrs. Harley and Son, from the plans of Mr. J. H. Hawkes.

The dealings in land and property during 1897 have been of a very satisfactory character. The total amount of the sales which took place at the London Auction Mart, £5,257,723, was considerably in advance of the total of £4,476,801 for 1896. In additiou, considerable transactions have been effected in the provinces, whilst nnmerous important sales have been concluded by private treaty. Ground-rents have again been eagerly sought after; the general price has averaged about 32 years' purchase. The year has seen a considerable increase in the demand for small freehold properties; building sites, both in the Metropolis and chief provincial centres, have been readily sold at good prices. Farms and agricultural land have not sold very readily.

Intercommunication.

QUESTIONS.

[11879.]—**Door Springs.**—Can any reader give me the name of makers of the Defiance hydraulic watertight door-springs, Mackie's patent?—A. E. C.

[11880.]—**Quantities.**—Should an architect supply his committee with a copy of the quantities when asked to do so, or should he refuse to comply with such request? The supplying of a committee with a copy of the quantities usually leads to interviews and explanations involving much loss of time and sometimes of temper; it becomes a waste of time, and sometimes is the fruitful source of mischief. I should be very glad to know what is the method generally adopted by the profession in this matter, and whether there is any established method of procedure regarding it.—C. D.

[11881.]—**Floor Calculation for Loads.**—How is a floor area to be calculated? It is supported on four columns under two main girders. These columns divide the space into three parts of 20ft. each. The area altogether is 60ft. square. I want to know how the weight on each girder is to be found.—A YOUNG BUILDER.

[11882.]—**Brickwork Facing Measurement.**—Will someone tell me the way adopted in taking off quantities of facings? There are gables included in the facing.—NOVICE.

[11883.]—**Hot Water Supply.**—Which system of heating is mainly used for the warming of large buildings like hotels, offices, and the like? A reader of the "B. N." may be able to give some particulars, which may be useful to others besides your correspondent.—A. G. S.

REPLIES.

[11862.]—**Strength of Cast and Wrought Iron.**—Your correspondent, "Yorks," puts a very pertinent question. What is the proper method of determining the sectional area of a cast-iron bracket upon a column, to receive the end of an iron or steel joist carrying, say, 50 tons—i.e., 25 tons strain on each supporting bracket, assuming the flanges of the joist to be 8in. wide. Also, what size ought a similar bracket of wrought iron to be? A year or so ago an account was published of the failure of cast-iron brackets on columns due to insufficient allowance for the tensile strain upon overhanging brackets. Do any of your correspondents remember the particulars?—LANCASHIRE LAD.

[11876.]—**Safe Load.**—If the walls are good and the trusses are sound, a load of, say, 2½ cwt. to 3 cwt. per super. foot may be carried. The safe load will depend on the length of unsupported tie-beam. If the trusses are queen-post, the effective span is, of course, reduced, and the load carried will be greater than if there was only one post in the centre supporting the tie-beams. The scantlings given are substantial, and if the trusses being only 8ft. 6in. apart, the unsupported area to be calculated will be the length of unsupported tie-beam by 8ft. 6in.—T. T.

[11877.]—**Attic Rooms.**—The roof slopes and ceilings may be lined with asbestos or slag-wool. Slabs are made for this purpose composed of silicate cotton and plaster. Or the rafters may be fitted or pugged with slag-wool, as well as lined beneath, and felted roofs are also effective in arresting damp and cold. A layer of felt may be secured to bottoms of the rafters, and then boarded below.—G. H.

[11878.]—**Solid Floors.**—The floor described by "Lancs" would resist fire for some time if the iron joists were protected below and the concrete made of a proper aggregate clinker, &c. The value of a solid floor as described is, that so long as it is imperforate or impermeable the flame cannot penetrate it, for as no draught or air can go through the solid floor the fire soon languishes from want of draught. The *impenetrability* of a solid floor forms its main power of protecting the upper stories; when once it is pierced or the concrete cracks and falls out, the flames soon make headway and the floor is quickly destroyed. Hence the importance of keeping the floor solid and impenetrable, which can be secured only by using fire-resisting concrete that will not easily crack when fire and water play upon it. I believe an underceiling of asbestos suspended by metal from the solid floor above may be made to resist flames for a considerable time. The upper solid wood joists, with concrete between as described by "Lancs," form a much better floor than one with open joists.—G. H. G.

Sir John Gilbert's personal estate has been valued at £231,584. The testator bequeathed to the Trustees of the Royal Society of Painters in Water-Colours, of which he was the president, his portrait in oil as a gift to the said society.

In the case of Walter Albert Williams, Tower House, Bromley, S.E., Regent-street, W., and Netherfield, Battle, Sussex, described as an architect and farmer, the order of discharge has been suspended for two years ending Dec. 7, 1899. (Public examination concluded April 18, 1893.)

The work of restoring the parish church of Stratford-on-Avon was recommenced on Tuesday. A good deal has been done within the last ten or twelve years, but beyond taking down the galleries in the side aisles and removing the whitewash from the walls and clerestory, nothing has been done to the nave. The work now commenced includes the removal of the pews from that part of the church, preparatory to the relaying of the floor, and the provision of a new system of heating. The contractors for the work in the nave are Messrs. Smith and Son, of Milverton, and for the heating apparatus Mr. John Grundy, of Manchester and London, the architect for the whole scheme of restoration being Mr. G. F. Bodley, A.R.A.

Our Illustrations.

ST. GEORGE'S CHAPEL, WINDSOR.

THE interior of St. George's Chapel, Windsor, and especially the choir of which a view is here given, is worthy of the Patron Saint of England. The style is Late 15th century, not yet run to seed in groinings and lacework in stone, yet the fanwork, panelling, and pendants of the roof are soberly rich, as befits the Freemasons Hylmer and Vertue who made them. But decoration and carving run riot in the oaken stalls of the Knights of the Garter, headed by their crested helmets, and shaded by silken banners—a grove of heraldry. Over all falls the varied colours of the stained windows. The chapel was founded by Edward IV., but not completed till the time of Henry VIII. Both these monarchs, who so freely beheaded their subjects, are here buried; so is Charles I., whose subjects beheaded him; so are also Henry VI., George III., William IV., while the burial here of the late Duchess of Teck is still fresh in the memories of readers of the BUILDING NEWS. Our plate is reproduced from a drawing by Mr. Charles Bird.

HOVE PARISH CHURCH, BRIGHTON.

A FEW days before his death last month, the late Mr. J. L. Pearson, R.A., lent us the drawing herewith reproduced in illustration of this imposing and well-designed church, which is one of his more recent works. So very seldom did Mr. Pearson care to have his designs illustrated, that the circumstance thus briefly alluded to adds an additional interest to the illustration, and having but lately seen the building itself, so far as its execution has been carried ont up to the present, we can speak of the ability and original taste displayed by the detail and design of the church, which merit the warmest praise. The drawing, as a matter of fact, hardly does the building justice. It stands at the corner of "The Drive" and Eaton-road. The accommodation is for 1,270 worshippers. The narthex at the west end will form the principal entrance. The nave is 108ft. long by 35ft. wide, and nearly 75ft. high. It is divided into six bays, and a feature is made of the baptistery. A triforium is omitted, in recognition of the parish-church treatment in distinction from that of an abbey church. The clerestory is comparatively low, after the English type, and the sills are about 40ft. from the floor. The eastern bay of the nave is much wider than the rest, and opens on the north and south sides into transepts: these arches occupy the entire height of both nave arcade and clerestory. The big traceried window at the west end mainly lights the nave, the glass area being 32ft. by 17ft. The roof is of oak, handsomely braced and framed in simple lines. The chancel is of three bays, and the sanctuary beyond makes the most effective feature in the church, as it should do. It is 23ft. long by 27ft. wide, and is entered by an arch 58ft. high, and the walls are carried up to 55ft.; this enhanced height and reduced width combine to produce an extremely lofty effect, which stands in marked contrast to the broader treatment of the nave. The reredos contemplated is to be of stone, and will cover the lower part of the entire east wall with sculptures in illustration of the life of Our Lord. The south aisle is 21ft. wide, that on the north being 16ft. All the doors open outwards, and are wide enough to admit Bath chairs. South of the choir is a morning chapel, 46ft. long by 21ft. wide. The western gable reaches 77ft. high. The tower parapet will measure 140ft. A pleasing feature is made by the south porch having sculptured figures in relief in the gable over a richly-moulded arch of elegant design. The vestries, and the room over them, are of a semi-Domestic character. The organ is lifted up, and located well for musical effect.

"ROYAL" THEATRE OF VARIETIES AND "ROYAL" BIJOU RESTAURANT, HOLBORN.

THE "Royal" Music Hall has been a landmark in Holborn for many years. Originally known as Weston's Music Hall in the old days, it was enlarged and remodelled by the then owner, Mr. Purkiss, who successfully carried on this most popular house of entertainment. Eventually the property passed into the hands of Mr. John Brill, who, immediately upon obtaining possession, decided to effect drastic alterations in the approaches to the building and generally to improve the accommodation for the public. An entirely new front of terracotta has been erected, embracing not only the original approach, but the adjoining property, No. 243, High Holborn; the entrance-hall has been made larger, new staircases built, and also a spacious saloon, with ample lavatory accommodation. The auditorium also has been redecorated and reupholstered, and a so-called bijou restaurant upon the upper floors arranged, capable of dining upwards of 80 persons. The remodelling of the "Royal" has been carried out from the designs and under the superintendence of Mr. Ernest Runtz, architect, of No. 10, Walbrook, E.C.

NEW PREMISES IN REGENT STREET.

THE building now in course of erection on the Hanover Chapel site, Regent-street, for Mr. T. H. Brooke-Hitching, from the designs of Mr. G. D. Martin, architect, 3, Pall Mall East, S.W., will consist of nine floors, inclusive of basement and sub-basement, the whole surmounted by a bold dome of polygonal form covered with copper, containing large room lighted by eight projecting louvres, the dome being terminated by an open cupola. The ground floor will be divided into four handsome shops with central entrance to upper floors, separated by red Aberdeen granite pilasters, and in the rear of shops there will be a large hall or show-room. The mezzanine floor, consisting of show-rooms to main cornice, will be executed in red terracotta, while the five upper floors will be carried out in Portland stone of bold treatment, and will comprise about 64 well-lighted offices, lavatories, &c., approached by grand staircase and hydraulic elevator. The whole of the floors and partitions will be of fire-proof construction.

THE HOUSES OF THE GUILDS, GHENT.

THIS plate is reproduced from Mr. A. Wallace Rimington's charming etching, published by him under the above title. The view represents the well-known Quai aux Herbes with the famous *Maison des Bateliers*, the most picturesque house in Ghent, to the right hand of the picture. The Guild of the Watermen's Craft held its meetings here, and their insignia, with the arms of Charles V., are carved on its gables, which date about 1513. The *Halle au Blé* is an earlier building of Domestic Gothic, belonging to the early part of the 14th century. The towers of the Church of St. Nicholas and of the Hotel de Ville appear over the gables on the waterside. We published on July 30, 1897, other sketches of this quayside at Ghent, by Mr. John D. Walker, of Bradford.

STUDIES ILLUSTRATING THE FABLE OF "THE HARE AND THE TORTOISE."

WE commence to-day a series of drawings showing the adaptation of Animal Forms to Decorative Design, with details artistically indicating the leading characteristics and habits of the birds and beasts chosen for illustration and study. Our first sheet comprises the National Silver Medal drawings by Mr. George Marples in illustration of the well-known fable of "The Hare and the Tortoise," and this admirable sheet may be taken as fairly representing the value and interest of the suggestive series thus commenced. The originals are in colour, which we cannot, of course, reproduce; but the monochromes will be found to do the designs justice.

ENTRANCE OF THE PALAZZO DURAZZO DELLA SCALA, VIA BALBI, GENOA.

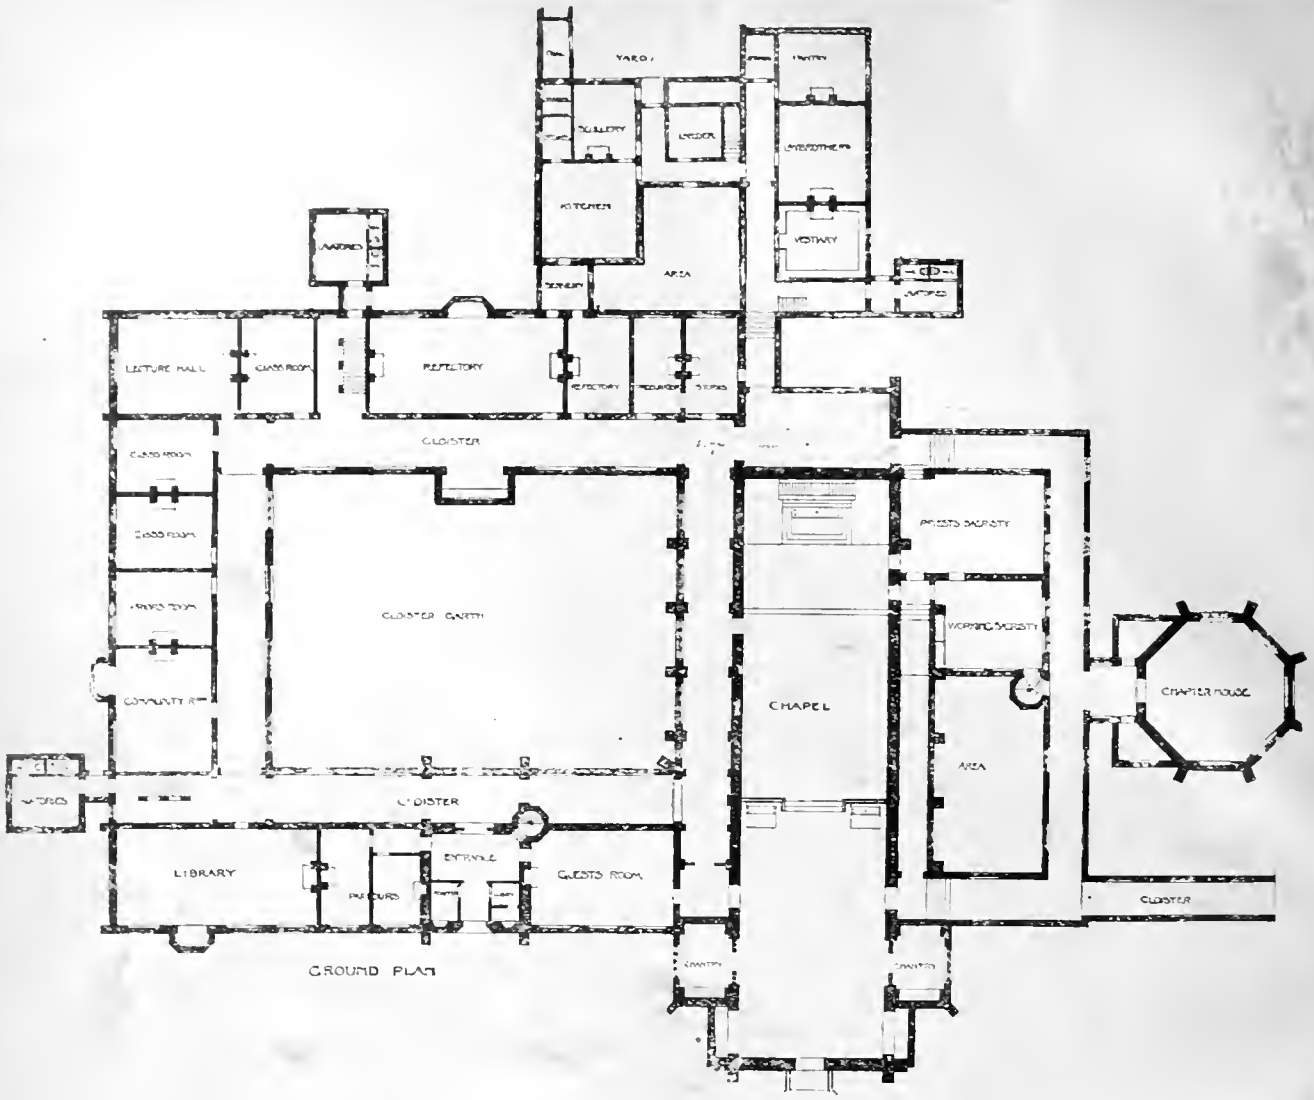
THIS Genoese Palace is too well known to need a description here; but illustrations of the building have not often been given, so that the pencil-drawing which we print to-day should be found useful, and it serves as a companion study to that of the Cortile of the Palazzo Balbi also at Genoa, which we published from the same hand in the BUILDING NEWS, Jan. 3rd, 1896. Both buildings are very similar in detail, and in some points are identical in design, while both are associated with their adjoining neighbour the Palazzo dell' Università, which in itself as a building is chiefly famous for its magnificent staircase, guarded by most grand lions.* The Palazzo Durazzo della Scala is remarkable mainly on account of its beautiful court surrounded by marble columns, and approached by a staircase with a triple row of steps. The Palace is possessed of the Pallavicini collection, as the Marchesa Durazzo was the daughter and heiress of the late Prince Pallavicini. Among the pictures are examples by Albert Dürer, Vandyke, Rubens, Guido Reni, Andrea del Sarto, and other masters. The two statues flanking the piers, which divide the staircase leading to the inter-columniated court of this palace, considerably enhance its grace and interest, showing the immense value of sculpture well-placed and sparingly used as the concomitant of good architecture.

> We loved that hall, tho' white and cold,
> Those niched shapes of noble mould;
> A princely people's awful princes,
> The grave, severe Genoese of old.

BRUTON CHURCH, SOMERSET.

THIS view of the beautiful and typical tower of Bruton Church, Somerset, is taken over the rambling and somewhat ramshackle old stone-built houses of the village street, making, when seen together, an exceedingly picturesque group, though these crumbling roofs necessarily hide the body of the parish church itself. The Brue, a shallow stream which finds its source in the neighbourhood of the town, gives to it the name of Bruton. There are several points of interest in the place apart from the church, and the uncommonly large number of richly-wrought signs to the several inns in the main street, particularly that outside "The Old Ball," add materially to the quaintness of the picture. The old hospital, too, founded by Hugh Sexey in A.D. 1617, has a small quad and charming hall, as well as a chapel in Late Domestic Gothic, a capital instance of simple vernacular work, thoroughly Mediæval in spirit, though built so long after the tastes of the day elsewhere had seen a material change towards the Renaissance. The church at Bruton was evidently designed by a most accomplished architect, and his work takes its place alongside the towers of Evercreech, Wrington, Wells, Glastonbury, Norton Fitzwarren, Ilminster, and Taunton; while in its proportions and actual beauty of design it surpasses many of these, although in point of size the Bruton tower cannot, of course, compete with the larger of them. There is an illustration of this tower in the Somersetshire Archæological *Proceedings* for 1852, p. 16. The importance of the elevation is much enhanced by the smaller tower over the porch in the north aisle. The roofs of the church are of much richness, and the traceried ribs of the nave roof tie-beams are somewhat unusual. The clerestory windows have beautiful niches between them, with rather well-carved modern angels introduced throughout. The crypt under the chancel is Transitional Norman; but the choir itself is a good specimen of florid Georgian, done in plaster. The west-end screen bears the date 1620, and the original Perpendicular screen from the chancel was incorporated with it seemingly when this work was done. The Jacobean pulpit and pew-ends are also worth mentioning, and when the late Mr. Herbert Carpenter restored the roofs and rebuilt the north arcade in 1874 he copied these old seats for the design of the new ones. The accompanying drawing, from a sketch made some years ago, has been completed with the

* See BUILDING NEWS, Sept. 17, 1897, for Views.



HAWKESYARD PRIORY, NEAR RUGELEY.

EDWARD GOLDIE, *Architect.*

aid of a photograph taken by the late Mr. John L. Robinson, R.H.A., in 1894, during the second visit of the Architectural Association Excursion in the Wells district. Some sketches of the signs and brackets in wrought iron referred to in these notes will be found illustrated by Mr. Maurice B. Adams in the BUILDING NEWS for Nov. 21, 1882.

DOMINICAN PRIORY, HAWKESYARD.

THIS building, situated in a beautiful estate near Rugely, Staffordshire, is now in progress. The finished portions include the chapel, the west wing, and the kitchen block, while work has been begun on the south wing. The design was originally intended to be carried out in Penkridge stone; this, however, has been substituted by red brick for the walling with dressings of the above-mentioned stone, the roofs being covered with green slates. The treatment throughout has been kept plain and simple, except in the church, where the chantry chapels, the forty-four canopied stalls in the choir, and the high altar are all of elaborate workmanship. The organ, which came originally from Eton, is a good specimen of 18th-century work; it is being rearranged, and will occupy a position on corbels against the choir wall. The architect is Mr. Edward Goldie, of 10, Kensington-square, W., and the contractors Messrs. Parnell and Son, of Rugby. Our illustration is taken from the drawing exhibited by the architect at the Royal Academy last summer.

HOTEL DE LA BOURSE, CAEN.

THE large number of important and historic buildings in Caen somewhat overcome and obscure this comparatively small but none the less exceedingly interesting building, the court-yard of which forms its main feature. Formerly known as the Hotel de Valois, it has long been used as the Hotel de la Bourse. A great feature was made by its designer of the arched entrance situate in the corner of the little quad. Sculpture is used freely and with much taste—indeed, the composition, as a specimen of the best period of the French Renaissance of the 16th century, takes its place very decidedly among the most admirable examples of the north-west of France. This is high praise for so restricted a work, but it is its merit architecturally, and not its mere size or relative importance of scale, which occasions our remark. Many more influential edifices could be mentioned, of course, but few deserve more attention or are really more suggestive. Our illustration is reproduced from a spirited line drawing by Mr. J. C. Halden for our contemporary, the *American Architect*.

CHIPS.

A Jubilee commemoration bridge is being built at Thorpe Haven, Aldeburgh, from plans by Mr. W. Sandcroft Randall, of Old Charlton, S.E. The first stake was driven with public ceremony last week.

The Hackney Vestry have decided to contribute £5,000 towards the cost of reconstructing the Cat and Mutton Bridge. The work will entail an outlay of £57,180.

Tewkesbury Abbey, perhaps the noblest parish church in England, needs further restoration. Between 1877 and 1880 £11,000 was spent on it, under the direction of the late Sir Gilbert Scott and his son Mr. J. Oldrid Scott. The Archdeacons of Gloucester and Bristol and the vicar of the parish are now seeking the aid of church people at large in the work.

The Louth town council, having applied to the Local Government Board for approval of the borrowing of £1,300 for the erection of a technical school, Colonel C. H. Luard, R.E., held an inquiry into the subject matter of the application at the town hall, Louth, on Tuesday. The building will be erected from plans by the borough surveyor, Mr. G. H. Allison.

The Board of Trade have, after modification, confirmed an order made by the Light Railway Commissioners authorising the construction of the Basingstoke and Alton Light Railway.

Mr. W. F. Woods, head draughtsman in the Bootle borough engineer's and surveyor's department during the past three years, is about to proceed to Sierra Leone, West Coast of Africa, having obtained a position there.

At a meeting of the building committee of the Royal Cross School for the Deaf at Blackburn, held on the 31st ult., Messrs. Sames and Green, of Blackburn, the architects were instructed to proceed at once to procure tenders for the extension of the school, at an estimated cost of £3,600, the whole of which has been promised by Archdeacon Rawstone.

Sir E. A. Bond, K.C.B., L.L.D., who, in 1878, became principal librarian of the British Museum, and retired in 1888 after a tenure of office which was marked by the introduction of several important improvements in the arrangement and management of the library, died on Sunday at his residence in London. He was made a C.B. in 1885, and the long-deferred advancement to K.C.B. was only announced the day before his death.

The county hospital at Huntingdon has just been enlarged and improved from plans by Mr. E. Borrisow, Mr. Keith D. Young, of London, being employed as consulting engineer. The outlay has been about £3,000, and the works include a new operating-room, the remodelling of the drainage and erection of new sanitary blocks, and the substitution of teak floors, supplied by Messrs. Roberts, of Islington, for old ones of deal.

Mr. G. W. Wilcocks, C.E., one of the inspectors of the Local Government Board, held an inquiry at the Shirehall, Shrewsbury, on Friday, as to the proposal of the corporation of the borough to borrow £48,000 for the purpose of a new water supply. Evidence in support of the application was given by Mr. E. B. Taylor, of the firm of Taylor, Sons, and Santo Crimp, the engineers of the scheme proposed to be carried out.

Building Intelligence.

ISLINGTON.—In the short space of four months Collins's Music Hall, Islington-green, has been rebuilt by Messrs. C. Dearing and Son, from plans and under the directions of Mr. Ernest E. A. Woodrow, A.R.I.B.A. The adoption of the cantilever system enabled the designer of the steelwork to make a single column suffice for the support of the balcony and gallery, so that the whole 1,800 seats have an uninterrupted view of the stage. This work was designed and erected by Messrs. T. Drew Bear, Perks, and Co., of 71A, Queen Victoria-street, E.C. The whole of the steelwork in plates and angles for the main girders are of English manufacture, and the girders themselves were made in London. The whole weight of steel in the construction of balcony and gallery is about 63 tons, and the load on the one column when the house is packed, as it was on Boxing Day, is estimated at about 200 tons.

TRURO.—A meeting of the general committee for the central technical schools for Cornwall (extension of the Passmore Edwards buildings) was held on Friday at Truro, Mr. Silvanus Trevail, F.R.I.B.A., chairman of the committee, presiding. It was reported that the city corporation had agreed to pay a considerable sum of money for the leasehold, and had been in possession as from Christmas Day. The trust deed, which was approved, provides for the management of the schools by a body of 30, composed of 10 members of the county council, 10 members of the Truro corporation, and 10 Truro citizens. The executive committee stated that when the tenders were gone into Mr. Colliver's was accepted, being much the lowest. Afterwards Mr. Colliver asked leave to amend his tender, owing to clerical errors. The secretary now stated that those errors represented a sum of £440. The chairman said the remarkable fact was that one of those errors was passed by an expert. The secretary explained that the mistakes were clearly made only in carrying out quantities and in casting up. The chairman added that the committee not only gave Mr. Colliver the chance of correcting clerical mistakes, but also Messrs. Clemens and Battershill, whose tender came next. The latter replied that they had made no mistake, but would take off £195 if certain work were excepted from the contract. There was no reduction of work whatever in Mr. Colliver's revised tender, which amounted to £6,540, against £7,178, the amount of the next tender. It was agreed to accept Mr. Colliver's altered tender. It was decided to have the contract signed at once, and to instruct the contractor to proceed with the work. Mr. Trevail is the architect of both the schools and the adjoining free library, the entire cost of both buildings being borne by Mr. J. Passmore Edwards. The schools are Tudor Renaissance in style, and were illustrated in the BUILDING NEWS for May 28, 1897.

At the University Chapel, King's College, Aberdeen, there was presented to the University on Monday, on behalf of the subscribers, a marble bust of the late Principal Pirie, executed by the French sculptor, M. Alfred Boucher.

A Bill to construct an underground electric railway from Charing Cross to Paddington has been deposited. The proposed railway will commence to the north of the Avenue Theatre at the southern end of Northumberland-avenue, and will terminate on the south side of James-street, near Paddington Station. In connection with this railway, it is proposed to construct a subway to the Great Western Railway Company's Paddington Station and another subway to Albert-terrace, Knightsbridge.

At Monday's meeting of the Stockport Board of Guardians an animated discussion took place respecting tenders for building new workhouse near Hazel Grove. Twelve months ago contractors were asked to send their names if willing to tender, and ten replied, the number being subsequently reduced to eight. A legal question arose, and no tenders were actually sent in. In consequence of the delay that has ensued, some guardians were in favour of throwing the competition open again. Others argued that such a course would be unfair to those who had already replied. The clerk said that fresh tenders would involve lithography to the amount of £200. It was retorted that if they could save £5,000 or £10,000 on the prospective outlay of £150,000 to £200,000 this would be only a fleabite. Eventually the board decided by 20 votes to eight to throw the competition open again.

LEGAL INTELLIGENCE.

ALLEGED JERRY-BUILDING IN BELFAST.—At Belfast, on Dec. 29, William Hill, Belmont-avenue, a builder and contractor, who recently sought municipal honours, was summoned by the corporation for having, in the erection of new buildings at Strandtown, in the city of Belfast, used materials and workmanship which had been disapproved of, after notice in writing of such disapproval had been given. Evidence for the prosecution was given by Mr. Boyd, a building inspector, who stated that the mortar and other materials were of inferior quality, and that defendant persisted in its use after he complained. Mr. James Munroe, assistant city surveyor, and Mr. J. C. Bretland, city surveyor, also gave evidence. Objection was raised that the city surveyor had not acted under the advice of the corporation in the action, and the magistrates reserved their decision.

DISTRICT SURVEYOR'S FEES FOR JUBILEE STANDS.—Mr. J. G Hornsby, 325, Strand, was summoned at Bow-street Police-court on Wednesday by Frederick W. Porter, district surveyor of Holborn and East Strand, to show cause why he should not pay £1 as a fee for surveying Jubilee seats at his establishment. Mr. W. H. Lees, deputy district surveyor, represented the complainant; Mr. Searle, solicitor, defended. Mr. Lees said the proceedings were taken under the London Building Act, Sections 54 and 57, which entitled surveyors to claim fees in a case of this kind. Sir James Vaughan said that might be so; but he must have proof that the money had been earned. Mr. Searle: I hold in my hand a receipt for £2 2s. my client has paid for surveying these seats, owing to the County Council not having done their duty. Mr. Lees: The £2 2s. they speak of was paid to the surveyor who prepared their drawings and made application to the County Council. Sir James Vaughan adjourned the case for evidence as to the work done by the district surveyor.

CHIPS.

Mr. J. F. Stow, C.E., has been appointed engineer and surveyor to the urban district council of Bridlington, in succession to Mr. R. R. Brown, who held that office for eight years.

On Tuesday evening the Sunderland Fire Brigade were called out to an outbreak of fire in the old parish church of Monkwearmouth. It was found that the large gas-pipe, connecting the main with the meter, was in flames, and quickly melting away. The flames were soon extinguished, and but little actual damage was done. At the back of the partition dividing the meter from the vestry was a number of ancient documents to which great value is attached by antiquaries. The part of the church where the outbreak occurred is the very oldest portion, and dates back nearly 1,300 years, having been built by the Ven. Bede almost synchronically with the ancient church at Jarrow.

St. Barnabas Church, Ashley-road, Bristol, was reopened on Tuesday after internal improvements from plans by Mr. F. Bligh Bond. The choir was formerly on the same level as the congregation, and the Pennant flags continued from the aisle to the Communion steps. The alteration has raised the choir-stalls, separating them from the body of the church by a step and a low freestone screen, and the floor has been laid with tiles placed in pattern. An alteration has been made in the Communion steps, and a new kneeling rail provided. In addition, a new pulpit of Corsham stone, the panels of which are divided by columns of polished Devon marble, has been given. In the centre panel a figure of St. Barnabas has been carved.

The new Government buildings in Queen-street, Nottingham, including Post Office, Probate Office, Inland Revenue Office, &c., will be completed and ready for occupation in April or May next. One or two of the departments are already finished. At a meeting of the city council on Monday in committee it was decided to ask some member of the royal family to open the block of buildings. The mayor pointed out that the city had contributed nearly £20,000 in land to the cost of the buildings. Land which cost the corporation £11 per yard had been sold to the post office authorities for £4 to encourage the Government to concentrate the various departments in Nottingham in one spot.

By the Bill which has been deposited by the Midland Railway Company for the construction of railways from Royston to Huddersfield, Halifax, and Bradford, power is sought to raise £3,600,000. The proposed extensions will comprise just over thirty miles of new line, and will commence by a junction with the company's Derby to Leeds railway near Royston, passing through Thornhill to Huddersfield, and from thence to Halifax. From this proposed railway another line is projected, eleven miles in length, from Thornhill to Bradford, where it will join the company's Leeds and Bradford railway. A short line is also proposed to connect the Huddersfield section of this extension with the proposed extension to Bradford.

Our Office Table.

THE law of Illinois providing for the examination and licensing of architects is to be put in force at once, and examinations of candidates are to be held for the first time on January 11 and 12 (Tuesday and Wednesday in next week) at Chicago, and on June 21 and 22 at the University of Illinois, at Urbana. Applications for examination must be made upon the printed form provided by the Board of Examiners, and must be filed, with a fee of 15dol., at the office of the secretary of the Board, at Room 1,112, Chamber of Commerce Building, Chicago. If the application is made in due form, notice will be sent to the applicant of the time, place, and extent of the examination, which will occupy two days. If the candidate fails to pass the examination, his 15dol. will be returned to him; but if he passes, notice is sent to him, and he is required to pay a second fee of 25dol., on receipt of which his license is forwarded to him. The license is for life, but is subject to revocation, for cause, by the Board of Examiners, and an annual fee of 5dol. is to be paid, in July, during the time that the license is in force.

TOLSTOY'S new book on "Art" is said to be one of the most searching and enlightened works of criticism that has for many years proceeded from his pen. It opens with a description of the rehearsal of a modern opera, and proceeds to a minute and exhaustively descriptive analysis of the theories of modern criticism of all kinds of art—musical, dramatic, pictorial. Its conclusion points directly to the inadequacy and worthlessness of the conceptions embodied in them. Tolstoy declares finally for his own ideal. This is directly opposed to the æsthetic theory, which he traces from the Renaissance to modern times, and denounces as a degradation, or rather, a negation, of art. His criticism resembles in this respect that of Ruskin and Morris, but it has a more consecutive and historical basis. It is written with the gentle persuasiveness, the sensitive literary touch, and the great moral and critical force which mark Tolstoy's best work. A translation will be issued in this country by the Brotherhood Publishing Company.

A BILL will be promoted next session by which a company propose to extend the Victoria Embankment to Lambeth Bridge, with powers to reconstruct a good deal of the adjoining neighbourhood. The works to be authorised by the Bill are:—A new street 90ft. wide commencing at or near the Victoria Tower of the Houses of Parliament and terminating in the Horseferry-road at a point of 70 yards to the westward of the western end of Lambeth Bridge. A new street 60ft. wide commencing at the eastern end of Great Peter-street, Westminster, at a point opposite the north-eastern corner of the Gas Light and Coke Company's premises, and terminating by a junction with street No. 1 at a point 250 yards north of Horseferry-road. A new street 50ft. wide commencing by a junction with street No. 2 at a point 170 yards east of the commencement thereof, and terminating by a junction with Horseferry-road at a point of 150 yards, or thereabouts, from the south-east corner of the property of the Gas Light and Coke Company. A new street 40ft. wide commencing by a junction with street No. 1 at the south-western corner of the Victoria Tower-gardens, and terminating at the commencement of an embankment hereinafter described. A widening of Marsham-street on the eastern side from the eastern end of Great Peter-street to Horseferry-road. An embankment or river-wall with a roadway 40ft. wide along the foreshore of the Thames, commencing at or near the south-eastern corner of the Victoria Tower-gardens, adjoining the Houses of Parliament, and terminating at the western end of Lambeth Bridge. The capital proposed is one million, with borrowing powers.

AT a meeting of the Auctioneers' Institute, held on Tuesday night in Chancery-lane, under the presidency of Mr. James F. Field, Mr. J. B. Matthews read a paper on the subject of the law relating to house and estate agents' commission, in which he said the law on this matter owed nothing to legislation. It depended entirely upon common law principles, which were to be found expressed in judgments which had been delivered by judges in various cases. The law relating to house and estate agents, in its main features, in no way differed from that relating to other

classes of agents, whose relations to their principals were regulated by the common law; but, nevertheless, house and estate agents formed a special class, whose rights and duties had so often come before the Courts for decision that it was possible to treat the present subject as a special one. The reader laid down from authorities the leading rules by which the right of house and estate agents to commission was governed, and illustrated those rules by reference to decided cases. Amongst the principle rules were: That, where the remuneration of a house or estate agent was provided for by an express contract, no other contract which was inconsistent with the terms thereof, whether founded upon custom or otherwise, could be implied, but the right of the agent to remuneration was wholly dependent upon such express contract; that, where the agent's remuneration was not provided for by an express contract, the amount of the remuneration, and the conditions on which it became payable, must be ascertained from the usage or custom, if any, which had become established in house and estate agency business. Considering the vast multitude of transactions of sale effected through house and estate agents, he thought it was very creditable to auctioneers as a body that cases of alleged misconduct were extremely rare.

The Woolwich and District House Owners' and Ratepayers' Association and the Greenwich, Deptford, Lewisham, and District Property and House Owners' Society have joined in a memorial to the Local Government Board, in which they urge the following reasons why the existing law as to "new streets" should be altered: "The law is defective, and its amendment would be of advantage to house and property owners, local authorities, and the general public. The owners of houses in new streets should not be called upon to provide the cost of paving before the work has actually been executed; local authorities should be empowered to borrow money for the purpose, and the cost of the work should be ascertained by inviting tenders. The paving expenses should be made a charge upon the property, and should be repaid to the local authorities by the owners by instalments covering a period corresponding with the period of the loan. Much litigation and expense are caused by the difficulty of defining the expression 'new street.' The making-up of all new roads and streets should be entirely under the control of the local authority, who should receive greater discretionary powers with regard to the charges for site abuttals."

In a short paragraph which appeared in our issue of a fortnight since, p. xvi., the first meeting was recorded of what purported to be the *Bath* Stone Firms, Limited, as having been held at the Board Pump Room, Bath; this should have been the *Hard* Stone Firms, Limited.

At the Hampshire Quarter Sessions at Winchester, on Tuesday, Mr. Temple Cooke applied for an order to close a road at Cowes near the Royal demesne of Osborne House, and in place of which the Queen had provided a more commodious and direct road. While the closing of the present road will be most convenient to the Queen and the privacy of the Royal island residence, the new road will be better in every way for the public, being wider and more suited for traffic. The Cowes authorities had consented to the proposed alteration, and the Court now granted the orders. The work will be completed at once.

The Glasgow Corporation have appointed Mr. W. A. Chamen, of Messrs. Crompton and Co., London, consulting and electric light engineers, to be electrical engineer for the city of Glasgow.

Trinity Congregational Church, Dewsbury, is undergoing alteration, and an enlargement, at a cost of £3,000. Its erection was commenced in 1868, from plans by Messrs. John Kirk and Sons, architects, of Dewsbury and Huddersfield, and completed in 1870. The cost of the building and fittings, exclusive of site, was about £8,000. An organ recess is being provided, in front of which will be a new pulpit in pitch pine. The electric light has been installed in church and schools, and a church parlour, ministers' and deacons' vestries, and class-rooms, with lavatories, &c., have been added. The schools are undergoing improvement. The architects are Messrs. Kirk and Sons.

Major-General H. Darley Crozier, R.E., held an inquiry, on Tuesday and Wednesday at Manchester, on behalf of the Local Government Board with reference to an application of the Manchester Corporation for power to borrow £180,000, of which £170,000 was needed for the purposes of sewerage and sewage disposal, and £10,000 for market purposes. There was no opposition.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Surveyors' Institution. Adjourned Discussion on "The Royal Commissioners' Suggested Amendments to the Agricultural Holdings Act." 8 p.m.
Liverpool Architectural Society. "The Architecture of Michael Angelo," by Beresford Pite, F.R.I.B.A.
Bristol Society of Architects. "Decoration," by H. Dare Bryan. 8 p.m.
Leeds and Yorkshire Architectural Society. Annual Dinner.

WEDNESDAY.—St. Paul's Ecclesiological Society. "The Black Chimere," by the Rev. Father Robinson, S.S.J.E. 7.30 p.m.
Edinburgh Architectural Association. "Abbeys and Cathedrals of Scotland," by P. McGregor Chalmers, M.A., of Glasgow. 8 p.m.

FRIDAY.—Architectural Association. "Composition in Regard to Public Buildings," by F. T. Baggallay, F.R.I.B.A. 7.30 p.m.

THE ARCHITECTURAL ASSOCIATION. JANUARY 11th, ORDINARY GENERAL MEETING, at No. 9, Conduit street, W., 7.30 p.m. Paper by Mr. F. T. BAGGALLAY, on "COMPOSITION."

E. HOWLEY SIM, G. B. CARVILL, } Hon. Secs.

CHIPS.

A stained-glass window has been placed in Hornsey parish church. The glass was designed and executed by Mr. C. E. Kempe. The central figure is that of St. John the Baptist; on the one side is "The Baptism of our Lord in the Jordan," and on the other side the "Scene of our Lord Blessing Little Children."

The Isle of Thanet Rural District Council have instructed Messrs. Bailey Denton, Son, and Lawford to prepare plans for the sewerage of Minster.

The new superstructure of Moorgate-street Station, designed by Mr. Delissa Joseph, F.R.I.B.A., has now been completed, at a cost of abont £18,000, the contractors being Messrs. J. Allen and Sons. The elevation, which is Classic in design, is executed in Portland stone, and occupies a frontage of about 155ft. to Moorfields, and of abont 90ft. to Fore-street-avenue.

The urban district council of Eton have instructed Mr. E. Bailey Denton, M.Inst.C.E., to prepare plans for the erection of a new pumping station, pumping machinery, &c.

The condition of Liskeard church tower has exercised the minds of the vicar, the churchwardens, and the townsmen for some time. It was generally held that the condition of the tower was dangerous, but the Chancellor of Truro refused to grant a faculty for taking it down and rebuilding it. Under further pressnre, and finding that the tower had been condemned as insecure by the borough snrveyor, the Chancellor has now granted the faculty applied for.

On Thursday in last week, Col. W. Langton Coke, M.Inst.C.E., held an inquiry at Rushton, near Blackburn, into an application of the urban district council for sanction to the borrowing of £1,441 for works of public street improvements, £1,890 for private street improvements, £834 for sewerage and sewage disposal, £130 for a store-room and cart-shed, and £905 for culverts at the Holt and Norden Wood tips.

John Newman, a builder's foreman, of Enfield-terrace, Hendon, was charged on Saturday, at Marylebone Police-court, with maliciously breaking a plate-glass window, valued at £5, on the premises of a refreshment contractor in the Harrow-road. Having been served with tea, the prisoner suddenly, without any reason, swept the crockery off the table and hurled some broken pieces about the shop. He then rushed out and threw a large stone through the shop-window. The defendant was ordered to pay £4 10s. for the damage, and was fined 10s.

On Wednesday afternoon in last week a new parish room connected with St. Paul's Church, Shanklin, was opened by the Lady of the Manor (Mrs. White Popham) and the Attorney-General (Sir R. E. Webster, Q.C., M.P.) The room is 60ft. in length by 28ft. in width, Early English in style, and cost £1,070.

The directors of the Birkbeek Pier at Weston-super-Mare, the pavilion and concert-hall upon which structure were destroyed by fire last week, have decided to reinstate the buildings on improved lines, and have instructed Messrs. Hans Price and Wooler, architects, of Weston, to prepare plans. The building was insured for £1,700, but the damage done has greatly exceeded that amount.

A new Congregational church at the corner of Beech Grove-road and Westmoreland-road, Newcastle-on-Tyne, is approaching completion. The church is being erected from designs by Mr. Stephen Piper, architect, County Chambers, Newcastle, which were chosen in open competition. The contract was let to Mr. G. H. Mauchlen, Newcastle, for £6,950, exclusive of heating and electric lighting.

Trade News.

WAGES MOVEMENTS.

BRADFORD.—"The stone trade has," says the *Bradford Observer*, "been good during the past year, both locally and for the London trade, the latter being mostly for tooled flags and landings, and prices have hardened a little, but not much, during the year. The following may be taken as the ruling rates during the year, the prices varying according to quality of stone—viz., 3in. tooled flags, from 3s. 9d. to 4s. 2d. per square yard; 2½in. ditto, from 3s. 7d. to 4s.; 2in. ditto, from 2s. 8d. to 3s. 2d.; 3in. self-faced flags, from 3s. 2d. to 3s. 8d. per square yard; 2½in. ditto, from 2s. 6d. to 3s. 2d.; 2in. ditto, from 2s. to 2s. 4d. per square yard; ashlar, 1s. 6d. to 2s. per cubic foot. Outside wall stones, from 44s. to 54s. per rood; inside ditto, from 20s. to 24s.; pitch-faced ditto, from 42s. to 50s. per rood. Bricks, 25s. to 30s. per thousand at the works. Quarryowners complain of the little profit left on a year's turnover, owing to the immense wear and tear involved in the heavy stone trade."

MANCHESTER. — The Baths and Washhouses Committee of the Manchester Corporation have received a communication from the secretary of the United Operative Plumbers' Association of Great Britain and Ireland in which regret is expressed that the baths and washhonses committee cannot see their way to employ plumbers to do certain work at the baths, and that in consequence "it will be impossible for any member of the association through the United Kingdom to do any work, either new, alterations, or jobbing, for the baths committee until such decision is revoked." The Operative Plumbers' Association object to the pipe fitting (mostly iron pipes) and repairs at the baths under the control of the committee being done by engineers and other permanent employés of the baths committee, generally in their spare time. The committee, having considered this warning, have decided to continue as heretofore.

LIST OF COMPETITIONS OPEN.

Crich—Water-Supply Scheme (3,100 population)	15 Guineas, 5 Guineas	Joseph Pym, Clerk, Belper	Jan. 8
Antrim—Dispensary (limit £750)		John Bullick, Hon. Sec., Bells-grove, Crumlin	,, 13

Crossgates—Four Terrace Houses	Wm. Conn	William Walker, Albert Mount, Horsforth	—
Church Stretton—Additions to Hotel		John R. Withers, Architect, Shrewsbury	—
Dromahair—Creamery	Dromahair Dairying Society	John O'Rourke, Secretary, Dromahair	—
Swansea—Block of Offices at Docks		Margrave and Peacock, Architects, Metal Exchange, Swansea	—
Shirebrook—Additions to Board School	Pleasley School Board	Frederick Ball, Architect, 23, King-street, Nottingham	—
Llandrindod Wells—Bath House, Pump-House Hotel		A. B. and W. Scott Deakin, Architects, Shrewsbury	—
Leeds—Shop Premises, Burmantofts-street	Robert Hudson	J. W. Thackray, Architect, 3, Rossington-pl., Gathorne-ter., Leeds	—
Cette—Theatre (estimated cost, £30,000)		The Municipal Authorities, Cette, France	—
Island of Inishbofin—National School		Rev. James M'Fadden, P.P., Glena, Gortahork	—
Burnley—Reconstruction of Who Could Have Thought It, Harpers-lane	Messrs. Grimshaw, Burnley	Charles Parsons, 9, Grimshaw-street, Burnley	—
Rawmarsh Hill—Three Houses		J. Platts, Architect, Old Bank Buildings, Rotherham	—
Cashelnager—Additions to National School		Rev. Jas. McFadden, P.P., Glena, Gortahork	—

ENGINEERING.

Bundoran—Waterworks	Guardians of Ballyshannon Union	James Perry, M.I.C.E., County Surveyor, Galway	Jan.	8
Dunmanway—Reservoir and Pipes	Guardians	J. Lane, C.E., Bandon	,,	8
Athens—Docks Extensions (about £110,000)		Chancelleno, Monarchie Attique, Athens	,,	9
Bedford—Electric-Lighting Plant	Electric Light Committee	T. S. Porter, Town Clerk, Town Hall, Bedford	,,	10
Swansea—Storm-Water Overflow	Urban Sanitary Authority	Jno. Thomas, Town Clerk, Guildhall, Swansea	,,	10
Cowbridge—Water-Supply Works	Rural District Council	Jesse Hurley, 10, Bridgend-road, Tondu	,,	10
Bootle—Electric-Lighting Plant	Corporation	J. H. Farmer, Town Clerk, Bootle	,,	10
St. Cyrus—Pipes and Reservoir		John Sim, Engineer, 160, High-street, Montrose	,,	10
Dublin—Boilers and Water Tanks, Mountjoy Female Prison	General Prisons Board of Ireland	S. H. Douglas, Secretary, General Prisons Board, Dublin Castle	,,	10
Begles—Harbour Works (about £4,200)		M. Kauffmann, Engineer, Bordeaux	,,	11
Radcliffe—Works at Public Baths	Urban District Council	J. Sharples, Clerk, Radcliffe	,,	11
Worthing—Covering Service Reservoir, Broadwater	Corporation	W. Verrall, Town Clerk, Worthing	,,	12
Sunderland—Pumping Plant	Guardians	W. Hodgson, Assistant Clerk, 17, John-street, Sunderland	,,	12
Rathdrum—Water-Supply Works	Guardians	B. Manning, Clerk, Board Room, Workhouse, Rathdrum	,,	14
Leeds—24in. Steel Foul Main at Meadow-lane Gasworks	Gas Committee	R. H. Townsley, General Manager, Municipal Buildings, Leeds	,,	15
Darwen—Refuse Destructor		Chas. Costeker, Town Clerk, Darwen	,,	17
Gloucester—Plant on Low-Tension System at Electricity Works	Electricity Supply Committee	Geo. Sheffield Blakeway, Town Clerk, Guildhall, Gloucester	,,	18
Kirkcaldy—Reservoirs at Holl, Arnot, and Carberry; and Filters at Holl	Waterworks Commissioners	William D. Sang, C.E., Kirkcaldy	,,	19
Pencoed—Widening Bridge	Glamorgan County Council	T. Mansel Franklin, Clerk, Westgate-street, Cardiff	,,	19
Tarragona—Construction of Telephone System	Spanish Government	Office of Civil Governor, Tarragona	,,	20
Skirlaugh—Heating Apparatus and Hot-Water Supply	Guardians of Skirlaugh Union	C. W. Hobson, Clerk, Newbegin, Beverley	,,	20
Navan—Waterworks	Town Commissioners	J. H. H. Swiney, M.I.C.E., Avenue Chambers, Belfast	,,	20
Nantes—Harbour Work (estimated cost £1 120)		Prefect of the Province of the Isere, Nantes	,,	22
Blair Atholl to Drumochter—Railway Widening (17½ miles)	Highland Railway Co.	Wm. Gowenlock, Secretary, Inverness	,,	24
Castlebar—Gasholder	Gas Co.	J. Sheridan, Secretary, Castlebar, Co. Mayo	,,	25
Belgrano—Military Port (about £2,000,000)	Argentine Government	Minister for Commerce, Buenos Ayres	,,	31
Oudtshoorn to Klipplaat—Railway (154 miles)	Cape Government	Agent-General, 112, Victoria-street, S.W.	,,	31
Dover—Compound Engines	Town Council	E. W. Knocker, Town Clerk, Dover	Feb.	1
Birkenhead to Ledsham—Railway Widening (8 miles)	Joint Committee	A. E. Bolton, Secretary, Paddington Station, W.	,,	2
Guipuzcoa, Bilboa—Electric Tramway (30 miles from Zumarrago to Zonnaya)		Commercial Department of Foreign Office, Whitehall, S.W.	,,	28
Pernambuco—Port Works	Government	Brazilian Ministry of Public Works, Rio de Janeiro	,,	28
Madras—Utilisation of Water of Periyar Lake		Chief Engineer for Irrigation, Madras	July	1

FENCING AND WALLS.

Willesden, N.W.—Corrugated-Iron Fencing	Urban District Council	S. W. Ball, Clerk, Dyne-road, Kilburn	Jan.	11
Stone, Kent—Wall and Iron Palisading, near Cemetery	Dartford Rural District Council	J. C. Hayward, Clerk, Sessions House, Dartford	,,	17
Willenhall—Fencing and Gates	Urban District Council	Chas. J. Jenkin, Engineer, Council Office, Willenhall	,,	27
Lazonby—Wall near Post-Office		E. James, Silloth		—

FURNITURE AND FITTINGS.

Claremorris—Bedsteads, Basins, &c.		J. J. Shanly, Clerk, Claremorris	Jan.	12
Liverpool—Extension of Nurses' Home at Workhouse	Select Vestry	H. J. Haggar, Vestry Clerk, Parish Offices, Brownlow Hill, Liverpool		—

PAINTING.

Glasgow—Bazaar Buildings	Corporation	A. R. McDonald, City Engineer, Glasgow	Jan.	19
Darwen—Municipal Offices	Corporation	C. Costellen, Town Clerk, Darwen	,,	19
Withington—Nurses' Home	Chorlton Board of Guardians	D. S. Bloomfield, Clerk, All Saints, Manchester	,,	25
Blackheath, Dulwich Park, Ladywell Recreation Ground, and Ravenscourt Park—Painting and Repairing Works	London County Council	T. Bell, Clerk, Council Offices, Spring-gardens, S.W.	,,	31

ROADS AND STREETS.

Wakefield—Private Street Works		The Town Clerk, Town Hall, Wakefield	Jan.	8
Slough—Street Works	Urban District Council	G. H. Charsley, Clerk, 11, Mackenzie-street, Slough	,,	8
Dartmouth—Limestone Kerb, &c.	Urban District Council	T. O. Yeale, Surveyor, Dartmouth	,,	8
Budleigh Salterton—New Road	Urban District Council	E. G. Warren, M.S.A., Commercial Chambers, Exeter	,,	8
Aberdeen—Street Works	Town Council	William Dyack, Borough Surveyor, Town House, Aberdeen	,,	8
Leamington—Blue Brick Paving in Clapham-terrace	Corporation	Consett Passman, Town Clerk, Leamington	,,	10
Moss Side—Sewering and Paving Passages	Urban District Council	W. R. Acton, C.E., Surveyor, Moss-lane East	,,	10
Southgate, N.—Making-up Roads	Urban District Council	W. M. Ellenor, Clerk, Palmer's Green, N.	,,	11
Annfield Plain—Kerbing	Urban District Council	T. J. Trowsdale, Surveyor, Annfield Plain	,,	11
Cannock—Street Works	Urban District Council	C. A. Loxton, Clerk, Cannock	,,	13
Preston—Paving and Flagging Ruskin-street	Corporation	Borough Engineer, Town Hall, Preston	,,	14
Stanley—Street Works	Urban District Council	John Geo. Ridley, Clerk, Stanley, R.S.O.	,,	15
Spennymoor—Paving and Kerbing Streets	Urban District Council	Fred Badcock, Clerk, 3, James-street, Spennymoor	,,	17
Fulham, S.W.—Making-up and Paving Town Mead-road	Vestry	Charles Botterill, Surveyor, Town Hall, Walham Green, S.W.	,,	19
Homerton Workhouse—Roadway in Women's East Yard	Hackney Board of Guardians	F. R. Coles, Clerk, Homerton, N.E.	,,	19
Dunoon—Road to Pier	Commissioners	C. J. M. Macintosh, Burgh Surveyor, Dunoon		—
Cardiff—Roads and Sewer Works at Canton		Veall and Sant, Architects, 5, Arcade Chambers, High-st., Cardiff		—
Sparkhill and Handsworth—New Roads		W. Roberts, Land Agent, 37, Waterloo-street, Manchester		—

SANITARY.

Kingussie—Sewage Works		Alexander Mackenzie, C.E., Kingussie	Jan.	8
Winchmore Hill, N.—Sewer in Green-lanes and Hopper's-road	Southgate Urban District Council	W. M. Ellenor, Clerk, Palmer's Green, N.	,,	11
Kingston-upon-Thames—Sewer in Hampden and Cambridge-road	Drainage Committee	Town Clerk, Clattern House, Kingston-upon-Thames	,,	12
Felixstowe—Earthenware Pipe Sewer (700 lineal yards of 9in.)	Urban District Council	Geo. S. Horton, Surveyor, Town Hall, Felixstowe	,,	12
Hayes—Sewer	Uxbridge Urban District Council	Charles Woodbridge, Clerk, 38, High-street, Uxbridge	,,	13
Sherburn—Sewer, &c.	Durham Rural District Council	William Lisle, Clerk, 33, Saddler-street, Durham	,,	14
Ballachulish—Drainage Works	Lorn District Committee	J. D. Sutherland, Clerk, Royal Bank Buildings, Oban	,,	15
Stanley—Sewer	Urban District Council	J. G. Ridley, Clerk, Stanley, R.S.O.	,,	15
Coventry—Sewers, &c.	Corporation	Lewis Beard, Town Clerk, 10, Hay-lane, Coventry	,,	17
Witham—Sanitary Work, &c., at School	S. Metropolitan School Managers	Henry Burgess, Clerk to Managers, Sutton, Surrey	,,	17
Newmarket—Sewers	Urban District Council	Sidney J. Ennion, Clerk, Newmarket	,,	19
Hendon, N.W.—Sewers in Edgware-road	Urban District Council	Henry Humphris, Clerk, Public Offices, Hendon, N.W.	,,	24
Coumbra—Drainage Works	Government	Department of Public Works, Lisbon	,,	25
Macclesfield—Sewers, &c.	Rural District Council	J. F. May, Clerk, Churchside, Macclesfield	,,	31
New Brompton—Drains	Gillingham Urban District Council	F. C. Boucher, Clerk, New Brompton, Kent	Feb.	2

STEEL AND IRON.

Leicester—Cast-iron Pipes and Connections	Gas and Electric Lighting Committee	Alfred Colson, M.I.C.E., Engineer, Millstone-lane, Leicester	Jan.	8
London, E.C.—Steel and Iron Work in Bridge Piers	Assam Bengal Railway Co.	F. A. Lyall, Secretary, 55, Bishopsgate-street Within, E.C.	,,	10
Harrogate—Cast-Iron Pipes, 1,000 yards, 9in.	Corporation	Samuel Stead, Borough Surveyor, Municipal Offices, Harrogate	,,	10
London, E.C.—Steelwork, Galvanised and Cast-iron Work for Running-Shed Roof	Nizam's State Railways Co.	The Managing Director, Winchester House, 50, Old Broad-st., E.C.	,,	13
Hull—Cast-iron Pipes	Corporation	F. J. Bancroft, Water Engineer, Town Hall, Hull	,,	13
Leeds—Steel Girder Bridge over River Aire	Corporation	The City Engineer's Office, Municipal Buildings	,,	19

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2245.
FRIDAY, JANUARY 14, 1893.

PROFESSIONAL GRIEVANCES.

THE architect is a long-suffering individual, and receives a great many more insults than falls to the lot of other professional men. His taste and art culture are called into question by Mr. Brown or Mr. Jones, and if he is at all sensitive about these points, his life is not an enviable one; but if he is fairly thick-skinned or retaliative in disposition, he can manage to give back as many kicks as he receives. When a client disapproves of a design, finds fault with the style or the elevations, the highly-strung artist is wounded to the core, for it is upon this part of the design that his chief reputation rests. It is like telling a painter that his composition is bad, or a musician that his performance is a failure; and yet it is one of the commonest disappointments the architect is called upon to suffer. No client, in whatever position he may move, hesitates to criticise the design of his architect, or to offer objections to this or that feature; while he may have the good manners to wrap it up in the general compliment, "That the design is very nice as a whole, &c.," as if he placed his taste and judgment on design on a level with that of his architect. When will the average lay mind learn that it is for this part of the work of the architect that he employs a professional man? Imagine a buyer of a picture or a sitter to a portrait questioning the skill and correctness of the artist! We have often thought it strange that a client should dictate to the architect of his house how it should be planned, when that was the very reason he came to seek a professional man! While the design is still in the air, the client leaves it entirely to his adviser; but directly it assumes a form on paper, then it is that all kinds of suggestions and alterations are made. Brown has seen a better plan somewhere; he wants something like Mr. So-and-So has erected; he likes half-timbered gables, or a square-shaped house. As if all these ideas could not have been thrown out before the plans and elevations had been prepared! The very fact they are not hinted shows that the ordinary client has no ideas of his own, and nothing to base them on until the design appears in tangible shape. After the design is made on paper he begins to compare it with other buildings, and thinks he can improve upon it. So with competition committees: they begin to criticise and discuss directly they get the plans in; the fussy committee-man compares A's design with those of B and C, as if his opinion was conclusive. In short, until the architect puts his own ideas into order and shape, no one else has any to offer; in fact, the client looks upon the design as a mere drawing that can be altered to suit his taste, and that has been expressly prepared for his approval. The grievance begins here. The client imagines that, as he employs, he can decide; he engages the architect to prepare designs for his approval, just as he looks to his tailor to show him patterns. The two things are not on all fours; the garment has to fit the customer, but the building has to be designed to accommodate at least the wants of a family, if not of a future generation of occupants. Everybody thinks he has taste, and can decide upon matters of style, of elevation, and decoration; but if this assumption was conceded, we should have so many variations that the architecture of our cities would be a very heterogeneous medley of ideas and of all stages of cultured and uncultured taste. A great deal, of course, depends on the way an architect goes to work, how he meets his client, and draws out from him his ideas and predilections. Some in the profession are skilled in this tact; they discuss the question of design with their employer, ask him if he has any preferences, if he can point to any building or design he likes, and by this means they can obtain some notion of their client's views, and then can discuss with him why these views are wrong, or point out their weakness. By so discussing the matter, the client is taken into confidence, and when he receives the design, he is much less disposed to find fault than he would have done if his opinions were not canvassed. We believe a great deal of unnecessary friction might be avoided if the architect talked the matter over, instead of thrusting upon him a design without consultation.

But, perhaps, the hardest blow is for an architect to have to "father" a design which is really his client's or his client's wife's; to get the credit for some monstrosity which he has been helpless to avert. Shorn of one feature after another, altered to suit the taste of someone who wishes to imitate a palace or a riverside bungalow, or that vulgar wish for smartness which characterises certain members of the mushroom nobility in our great towns, the architect's original design is so transformed that it can scarcely be recognised. It is a hard case for an architect to be credited with the authorship of a building to which he has been little more than the passive draughtsman, interpreting the wishes and taste of his client. If the practice which we believe now obtains in Belgium amongst architects of inscribing their names in small capitals at the right-hand corner of the main front of their buildings be generally adopted, it would be a decided hardship in this instance. The idea of inscribing the name of the author of a design is in itself a good one, so long as he is the real author of the work. On the other hand, it would be a grievance if he signed his name to a building that was really the outcome of a parsimonious client or an ignorant board. Anonymity would be far more desirable in such a case.

In the domain of plan also, the client asserts his opinion. Here we come on common ground. The employer who engages an architect to prepare plans for his business premises or his house has a right to ask for certain arrangements and accommodation, and, if so disposed, to suggest a plan. He is supposed to know best what he wants, though it is worth while to mention that, though he may have some idea of what he wants, he is quite unable to make a plan that can be built. We have known clients sketch out on paper roughly a plan of a house, as, for instance, the schoolboy's idea of a row of rooms with a long corridor entrance, or a square box with rooms on each side of a centre passage, but which are useless as guides to the architect. In short, he comes to an architect to put his wants into shape. Directly they are embodied in a plan, all kinds of alterations are suggested, such as a few feet more to this or that room, another bedroom or closet. The wife wants an alteration, or some friends suggest something that requires the whole recasting of the plan, and, as a consequence, the elevations. What other professional man has to put up with it? Does the painter, the sculptor, the lawyer, or the physician? No. His vocation would be gone if he made any such concessions or alteration in his plans. Even in competition, the patience and forbearance of the architect is sorely tried. In the recent Cardiff Municipal Buildings, selection the definite instructions of the committee have have been set aside in the selected plans, as pointed out by a competitor last week. The plans premiated show, it is alleged, many of the instructions ignored. Have we not also had similar complaints in the matter of the Battersea Baths? And have not our pages rung with the grievances of the Walthamstow and Finchley competitions? What is to be said of a committee who publish conditions which lay down certain requirements, and then ignore them altogether? Have we not here a proof of the inability of the lay mind to enter into questions of plan in a comprehensive manner, or of making up their minds on certain requirements? The fact of the matter is, an architect often sees a better way of obtaining the desired result by modifying the conditions; whereas the stickler to instructions may miss after all the most vital points in the scheme. The lesson is not to insist on hard-and-fast conditions in all cases. To mention another competition grievance: in some of these contests of skill, as in the pending Carshalton Hospital, the committee make the unsatisfactory stipulation that if necessary they retain the power to adopt the features of any of the designs they premiate, by which arrangement the brains of two or more competitors who are awarded prizes may be robbed at the mercy of the board—an exceedingly ungracious act, if not insulting to the competitors.

Sometimes, under the cloak of compliments, the architect receives a thrust not less wounding because it is given under the cover of politeness. We heard of a case lately in which an influential vestryman of an important board complimented an architect on a successful building, and promised him his support and recommendation after this fashion: "If you will send me your plans, I will have much pleasure in submitting them" (not to the committee for carrying out, but, alas!) "to our own surveyor!" What could be a greater slap in the face? But who has not been told quite provokingly: "I will show your plans to a friend, or to my committee, and if approved you shall hear further from me," or something of the same kind? Probably an architect would sooner submit his design to a layman or outsider than to a brother professional. It adds much to the annoyance to find one's plans or ideas have been appropriated by another professional man without acknowledgment or remuneration. Many competitors have cause for complaint on this score. The Walthamstow Baths grievance, which has been so recently discussed, does not stand alone. In many instances, a public competition seems to have been devised by a committee for no other purpose than that of providing the promoters with suggestions and plans at a small cost, usually the offer of a couple of premiums, both of which together would barely have paid the expenses of an architect of repute. And this view is confirmed by the treatment that has been meted out to successful competitors, whose plans have been in many cases carried out by the surveyor of the board. The Quebec Association of Architects have just issued a circular to their members, some of whom have taken part in competitions on very humiliating conditions, agreeing to make designs and obtain tenders without any chance of remuneration. Cannot we remember also instances of fictitious competitions, by which designs have been received, but the premiums have been withheld? Is it fair to assume that nobody has benefited? The pickings from the plans of say fifty designs amount to a robbery quite as audacious as if the promoters had bodily stolen the ideas of one man. On the former supposition the victimised could hardly complain; but, on the latter, the author could claim, if he did not always get, compensation.

The employment of so-called artists and tradesmen, who spoil the work of the architect, is the cause of much heart-burning to the sensitive soul. It is really hard on the

architect after his building is completed to find the decoration or fittings left to some decorative firm, as if he were not artist enough to complete his own design. This is one of the dangers due to specialism in art, and one which the architect himself should resent. If he can design a room in all its structural appointments, he is surely the right man to suggest its decoration. But, no; the decorative artist is consulted—a firm of decorators from Oxford-street or Tottenham Court-road. Unfortunately, the practice has grown from the mere negligence or apathy of the architect to assert his prerogatives, and those who are competent and ready to fulfil their proper functions have to suffer for the indifference of other members of the profession to claim their just rights. In the decoration of such buildings as town halls, theatres, and hotels the specialist designer or manufacturer is called in, or invited to prepare designs and estimates, so taking away from the architect perhaps one of the remunerative parts of his design. Between the tradesman, fitter, and decorator the architect's work is frittered away, while he is still held responsible for the shortcomings of those who supplant him.

INDUSTRIAL DEMOCRACY.*

ONE of the most important developments of our age is trade-unionism, and its history and progress from the 18th century as it affects the various handicrafts has been made the subject of an interesting work in two volumes by Sidney and Beatrice Webb. The regulation of the conditions of employment has a special application to the building trades, whether we regard it as a result of economic science or in a more particular light. To take, for instance, the trade-union regulations as to apprenticeship, we find certain traditions that have come down from Mediæval times. One of these was the reciprocal obligation between master and apprentice, the former agreeing to teach the mysteries of his craft, and the latter to serve for a given term for wages below the market rate. These obligations were enforced by the guilds. The conditions were: a premium paid, a certain age, a term of servitude, and a limitation of the number of apprentices permitted to the master. We know from the work turned out by members of these guilds how well this system worked. Besides this formal apprenticeship, the journeyman also had the privilege of bringing up his son in the trade, or, as it was known, "patrimony." This privilege does not appear to have been regulated by guild law, but on the custom of the workshop. It was, as the authors say, a "privileged exemption" from the law; the son could enter his father's workshop at any age the latter liked, and for any period. And we find this custom or "patrimony" became a vested interest, which is still strong in some trades. Mr. Webb gives instances of both these systems. The United Society of Boilermakers and Iron Shipbuilders have a formal code of rules regulating the admission of apprentices in all parts of the kingdom. There is a distinction between the "rivet boy," who is taught nothing, but is paid full wages, and the apprentice who is taught the trade. To become an apprentice to the trade, he foregoes half his earnings; but the raw youth can try his hand on work for which he is as yet unfitted—he does not do mere mechanical routine. To illustrate the latter system—apprenticeship to a journeyman—the authors refer to the cutlery handicrafts. Hereditary succession is universal, and no journeyman is allowed by the Britannia Metal Smiths to take an apprentice except he be his own or a journeyman's son, and he cannot have an apprentice in addition. Under this rule any collective regulation of apprenticeship is out of the question, as the father adopts his own time and methods. The Stonemason's formal apprenticeship coexists with patrimony, and this is described. The rules of the craft vary in localities. There is a limit of one boy to five or six men. A youth after working three months at the trade is bound apprentice for five or seven years. An agreement is drawn up; every mason can bring up as many of his sons as he likes to the trade. The son is kept at work till he is 16 and strong enough to enter the trade, and then he works in the shop for the employer as an improver at a full man's wage. Other trades are described, but those we have noticed maintain apprenticeship regulations. In some trades of to-day the ranks of the unionists are recruited by men who have not conformed to such rules. The compositors form a handicraft of a highly-skilled body of men. Machinery has not been able to make the craft easier to learn, or to divide it. Mr. Webb remarks: "It is probable that a very considerable proportion of the men who obtain work as compositors, and join compositors' trade-unions, have undergone no period of educational servitude at all, with or without indentures, and have 'picked up' such knowledge of the trade as they possess whilst earning a full market rate of wages," and any attempt to limit the number of persons entering the trade has failed, no doubt owing to the wonderful progress of the printing industry, and the great variety of employers. So that, while in some trades which are in a flourishing condition the entrance is free and unguarded, in others, equally flourishing, like the boiler-makers and ship-builders, exclusive regulations are enforced.

The authors next consider "Progression within the Trade." The London builders cease to employ boys, the Operative Society of Bricklayers is recruited largely from young builders' labourers, who are allowed to decide up to the age of 25 whether they will abandon the hod for the trowel. The progression is unregulated by any rule. The Manchester Slaters' and Labourers' Society admits to membership as a labourer any man actually working with a slater, and from such the ranks are recruited. A labourer who desires to become a slater must serve seven years on the lower grade, and then apply to the secretary of the union. A committee of six practical slaters then examines the candidate in the mysteries of the craft, and if he passes he is recognised as a slater, and can demand full pay. The number promoted by the union is limited to three in each year. Many instances are given of the "over-lap" between trades. The lines of demarcation between allied crafts vary locally. In iron shipbuilding the most "numerous and complicated disputes" about over-lap are said to arise, and this obscuring of the lines between the trades has been brought about "by the gradual transformation of the passenger ship from the simple Deal lugger into an elaborate floating hotel." Thus the plumber has always done the sanitary work in vessels, but the iron piping of the steamship has been claimed by the engineer: hence plumbers and fitters both complain. Sharp conflicts have arisen on this account. Engineers have quarrelled with boiler-makers, shipwrights, the joiners, brassworkers, plumbers, &c.: the joiners have quarrelled with mill-sawyers, pattern-makers, and cabinet-makers. These disputes often create confusion and strikes and loss to the employer. Many interesting instances are given, and the authors point to a tribunal of the trade-unions to settle differences; the adjudicators are well versed in the technical details of the trades. The principle is pointed to on which the tribunal should act; it cannot be on any "right of the trade." The employer has the right to decide which workman he will engage; therefore, "what each trade-union asks is that the recognised standard rate for the particular work shall be maintained." Here the authors rightly say: "The federated trade-unions, instead of vainly trying to settle to which trade a task rightfully belongs, should, in fact, confine themselves to determining, in consultation with the associated employers, *at what rate it should be paid for*." A definite standard rate for a particular task has been put forward by the general secretary of the Amalgamated Society of Engineers; and the authors' remark: If this simple principle were adopted, say, in the great shipbuilding yards, and accepted by the employers and the federation of engineering and shipbuilding trades, all would be well. The "standard" rate would be determined, as now, by collective bargaining between the associated employers and the trade-union, instead of by the individual employer or workman. In another chapter, on the "Verdict of the Economists," the arguments in favour of combinations of wage-earners are treated—that the workers should protect themselves by "higgling and bargaining" if they are not to suffer lower wages than there is economic necessity for. Professor Edgeworth and Professors Taussig and Marshall are quoted. The advantage of unions in benefiting the worker is generally admitted.

Considerable space is given to the custom of "higgling and bargaining" upon which the conditions of employment depend. The arguments for and against trade-unionism are temperately discussed in these chapters. In making labour contracts, the individual workman is at a disadvantage when compared with the capitalist employer. Many conditions cannot be determined by the workmen: the speed of work, its quality, how many hours he shall work, intervals for meals, fines, &c., are matters left to the foreman. The workman has to accept these conditions, for he cannot know beforehand what they are. "Moreover," the authors say, "unless fixed by law or collective bargaining, these conditions may at any moment be changed at the will of the employer or the caprice of the foreman. These, no doubt, are disadvantages to the isolated workman in bargaining with the employer. Trade-unionism remedies these defects of a "merely instinctive standard of life." This standard is described as the "existence among workmen of identical notions as to what constitutes their minimum subsistence"—itself a bulwark against the pressure of competition. But we must stop here. In the first volume the authors discuss Trade-Union Structure under four chapters: "Primitive Democracy," "Representative Institutions," "The Unit of Government," "Interunion Relations"; and in Part II., Trade-Union Function, such as "The Method of Collection," "Bargaining," "Arbitration," "The Standard Rate," "The Normal Day," &c. The authors of this valuable contribution to the important subject of trade-unions have given a lucid scientific analysis of trade-unionism, which has cost them six years' investigation and research. The various trade-union organisations and their regulations have been described in detail.

The second volume, dealing with the function of unionism, is the more important, perhaps, to the economist and politician: the psychological origin and reason of each code of rules is revealed, these being the intention which originated them, or the grievance to be met. On the whole, we must say the authors have ably handled the task they have undertaken, whatever judgment may be passed on the facts and generalisations which will always remain more or less speculative. But as an economic theory based on incontrovertible facts and assumptions, the authors have made a strong case for these protective agencies and the value of combination.

* Industrial Democracy. By Sidney and Beatrice Webb. Two Volumes. London: Longman, Green, and Co.

WROUGHT-IRON AND STEEL IN CONSTRUCTIONAL WORK.—XXXIII.

TIE-RODS or tension-rods are used on roofs and bridges chiefly. Much depends upon them, and their dimensions, forms, and methods of fitting vary. Tie-rods are used in two forms —those of round, and those of rectangular oblong

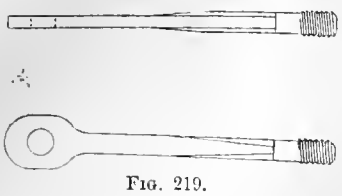

FIG. 219.

section. The first are generally preferred when there is nothing to interfere with the breadth of the rod, the latter when rods are confined sideways, as when two or more rods have to be laid side by side, or have to pass each other in a contracted width. But generally, most rods of small area of section are round, and those of large section rectangular.

Rods are secured in three ways—one by means

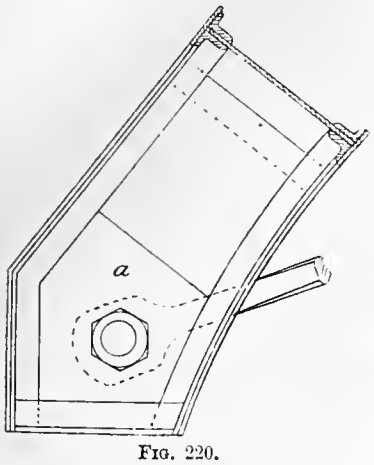

FIG. 220.

of pins, another by screw nuts, the third by wedges. The second can only be employed on rods, the ends of which are of a circular section; the other two are applicable to each form. The rods themselves are in tension; but their fastenings are in shear. In order to the tightening up of long lengths of rod, it is often necessary to resort to the use of capstan nuts, or of long sleeve

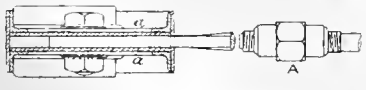

FIG. 221.

nuts. The workmanship of these connections is the subject of strict specifications, because the failure of a tie-rod will often mean collapse of the principal members. The area of cross-section of screwed ends, the area of the metal on each side and at the ends of eyes, the question of welding on of eyes are, therefore, subjects of the

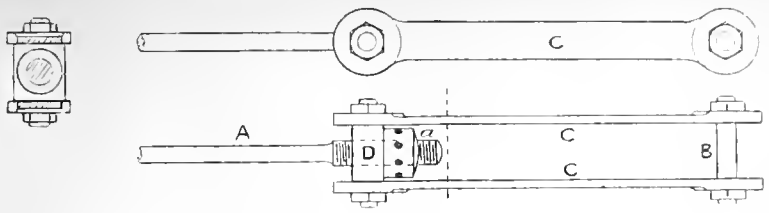

FIG. 222.

tainty in regard to welds made in steel, while there is hardly any risk when wrought iron is concerned. Neither, apart from special machinery, can steel be upset so satisfactorily as iron. It follows that eyes and enlarged screwed ends can be safely welded on iron rods, and that small extensions also can be upset on iron, the results of which are more uncertain in steel. Rods in steel can be made lighter than those of iron for equal strength, but that can only be done when the workmanship is fully reliable. In saying that steel is not so readily and reliably welded as iron, that does not mean that welds cannot be made, but that they are not to be trusted. In careful hands good welding can be done, but this is just one of those matters which must always be uncertain. A little scale in the middle of a weld, some unequal heating, insufficient hammering of the right sort, may cause a weld apparently sound as far as external appearance goes, to be of not half the strength of the solid bar. It is for this reason distrusted, and only tolerated when absolutely unavoidable. The Board of Trade imposes severe restrictions on this kind of work. In the hands of a specially-skilled workman, such welding is practically safe, but the steel should be of the mildest.

In the fitting of eyes and pins, rough or black fits are only permissible in some of the lesser details. In the main ties at least, all pins must be turned, and their holes drilled or bored. This is necessary in order to insure an equal distribution of stress. Without this, one cannot be sure that a pin is in double shear, or that a rod is not receiving an initial twist or pull, tending to draw it out of a straight line. It is not desirable that the fit be tight. On the contrary, there should be sufficient freedom between the pin and its holes to permit of its being thrust in by unskilled labourers without the need of oiling, as in the case of much high-class machine work; $\frac{1}{32}$in. of difference in size is a suitable allowance.

Eyes or links are generally made from the solid metal—that is, they are not bent round and welded, as is the practice in some light work, in which the hole bears a large proportion to the metal surrounding it. In the latter it is better to bend the eye when wrought iron is used, because the strength is greater across the fibre than parallel with it. In the former kind of work, however, it simplifies the workshop details to punch or drill through the solid, and leave an excess of metal at the end where the grain is short. In steel there is practically no grain, and no difference in strength either way; and as, further, welds in steel are uncertain, the practice is to form all steel eyes from the solid.

Eyes, and screwed ends generally, have to be made in such large quantities for a big contract that special means are adopted to expedite the production, and to insure absolute uniformity in all, so that if necessary all of a given dimension would be interchangeable. This is too wide a subject to treat in a series like the present. But briefly, these methods may be summarised as follows:—

why machinery is laid down for such a method is because nearly all American bridges are pin-connected. In England there is no such plant, and the method adopted here in the formation of long tie-rods is to forge the eyes and the screwed ends separately from the main body of the rod, and after having done the work of drilling the first and screwing the second, to weld them with long scarfed joints of, say, from 4in. to 10in. in length—dependent upon diameter —to the rods. This method saves all trouble in manufacture otherwise due to the handling of long tie-rods, and in the case of iron there is no special difficulty in welding. In the case of the very short rods there is no need to adopt this plan, but the rod may be drawn down by fullering between the ends from a bar of the full area of the ends.

In reference to the methods of formation of the eyes and screwed ends separately from their rods: These are roughed out nearly to shape in the

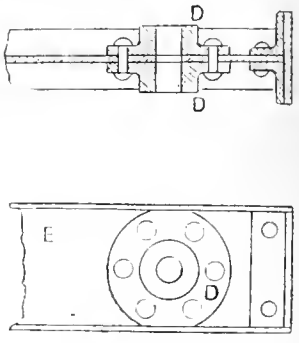

FIG. 223.

forge, and the precise finished shape is imparted in dies of cast iron or of steel under the steam-hammer. A hundred or a thousand will then all be precisely alike, and an enormous amount of time otherwise spent in finishing to neat outlines is saved. If deemed necessary, the holes in eyes can be punched at the same heat as the finishing to outline in the die, and this is generally desirable, because it does not injure the metal, and it saves some time in the subsequent boring. The screwed ends are cut in a screw-cutting lathe, and when quite finished, eyes and screwed ends are welded, and the rods are ready to go into place.

Taking now a few examples of tie-rods. Figs. 219—221 illustrate an eye-bar end of a tie-rod and a method of its attachment. The length, Fig. 219, is one which can be best forged by drawing down without any welding. In Figs. 220, 221 it is seen fastened to a roof principal, Fig. 220 being in elevation and Fig. 221 being a section through the principal, just above the rod. The web of the principal, though single throughout the greater portion of the span, is doubled

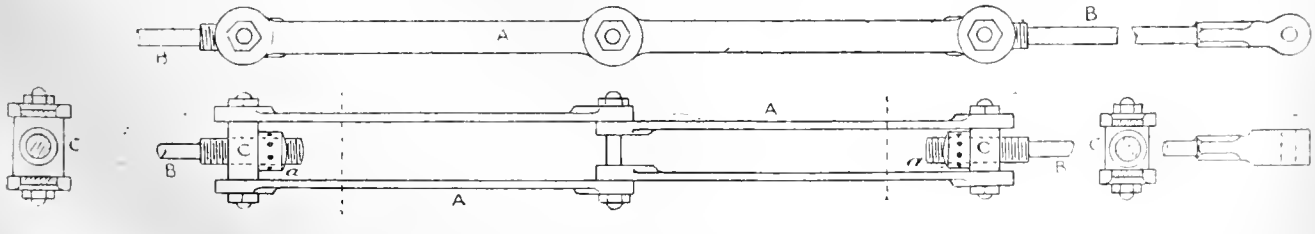

FIG. 224.

first importance. Fortunately, strains are always of a direct and simple character, instead of uncertain, as they often are in many riveted joints.

Though steel is often used in tie-rods, wrought iron is also still largely employed. The reason lies in the fact that there is always some uncer-

American practice, as remarked in a previous article, differs from ours in respect to the formation of steel eyes. These are upset by special forging machines, by which the fibre is so coerced that the upsetting does not open it out as it would by hammer processes. The reason

and spread out laterally at and near the feet, where they rest upon the supports. The tie-rod ends are therefore fitted between the double webs and united with a pin. At the locality where the pin-connection is made, the webs are strengthened with additional outer plates *aa*. At A is seen the

long screw-nut, by which the rods are tightened up.

Figs. 222, 223 show another way in which to connect a tie-rod A to a pin-connection B in a rafter of joist section. Two links C C embrace the ends of the pin, and a forged block D receives the end of the tie-rod, which is tightened with a capstan nut *a*, by which the tension is adjusted. The pin-connection B passes through castirgs

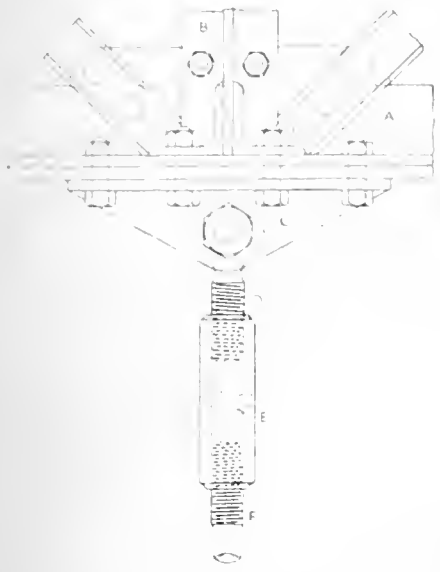

FIG. 225.

D D on the faces of the rafter E, Fig. 223, and riveted through it, and the links C C clear the flanges of the joist which forms the rafter.

Fig. 224 illustrates a pair of links A A connecting tension-rods B B. The links themselves are united with a bolt at the centre, and blocks or

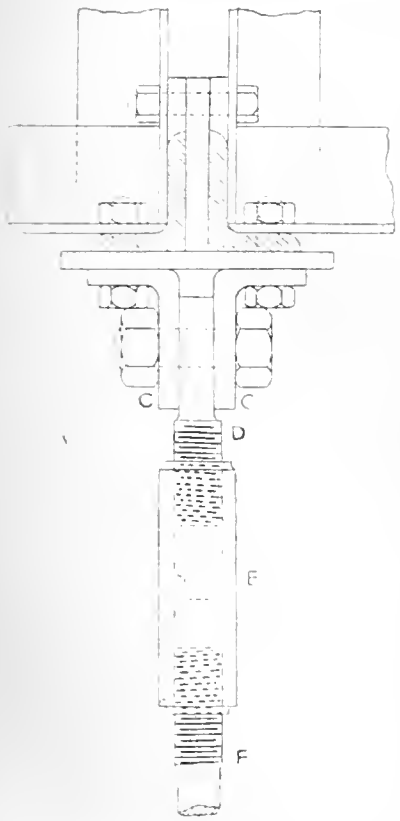

FIG. 226.

crossheads C C are bolted between the links at the ends to receive the screwed ends of the tie-rods. The rods and links are strained to their proper tension by the circular capstan nuts *a a* pulled round with a tommy.

Figs. 225—228 show fastenings for radial-supporting rods connecting the principals and ties of the Liverpool Central Station. They are

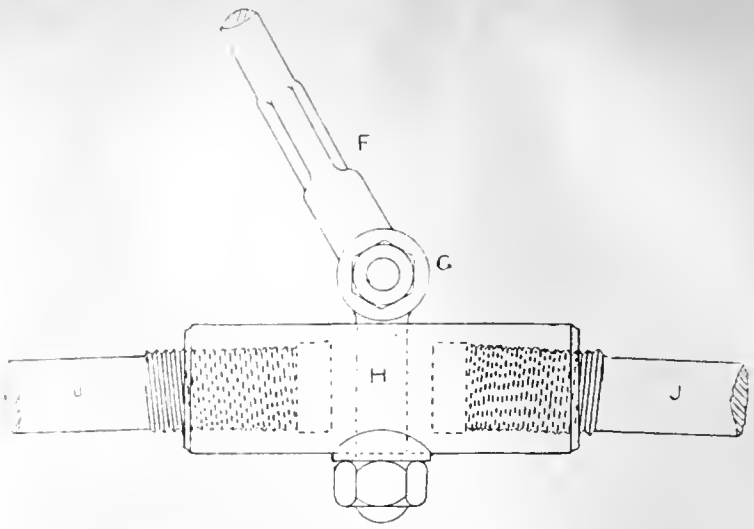

FIG. 227.

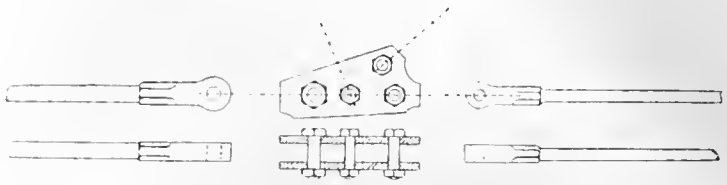

FIG. 229.

attached to the principals beneath the purlins, with provision for tightening. At the tie-rod ends also there is provision for tightening the lengths of which the tie-rods are composed. In the Figs., A is a portion of the principal, B a portion of a purlin, C C two wrought-iron brackets bolted to principal and purlin. The suspension-rod, with connecting tightening-nut, is made in three portions, the short length D, Figs. 225, 226, having a screw at one end, and

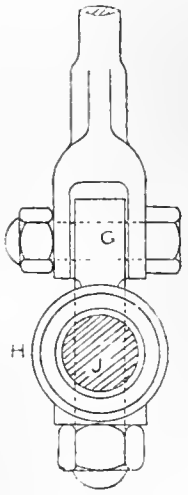

FIG. 228.

an eye at the other passing between C C, the main portion F extending down to the horizontal tie-rods: F and D are put into proper tensional adjustment by the long sleeve-nut E. Below D there is the short length G, Figs. 227, 228, with

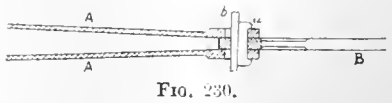

FIG. 230.

eye-bolt and nut to pass through the tie-rod sleeve-nut H, which is screwed right and left-handed to suit screws in the ends of the tie-rod lengths J J. The ends, it will be noted, are enlarged at the screwed portions to preserve the strength of the rod unimpaired, and the sleeve-nuts are of sufficient length to permit of ample range of adjustment.

Fig. 229 shows a triangular-shaped pair of connecting links which serve as a point of union for three tie-rods, and one strut, at the different angles indicated. These plates are of wrought iron or steel. The ends of the horizontal tie-rods are shown to right and left.

The attachment of a tie-rod to the ends of a principal by means of wedges is shown in Fig. 230. Two broad jaws, A A, forged from plate, and tapering in depth or in width, are

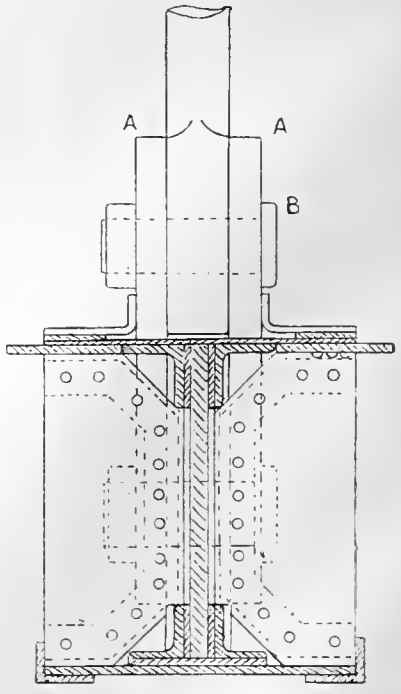

FIG. 231.

riveted to the webs of the principal, which is spread out at the base similar to Fig. 220. Cottar-ways are slotted in the tie-rod end B to receive the gib *a* and cottar *b*, by which the tie is tightened up.

Figs. 231, 232 illustrate in elevation and in vertical section the method of attaching the suspension links to the cross-girders of the roadway of the Tower Bridge. The girders are single-webbed, but are thickened up at the ends where the links are attached. Here broad plates

are riveted on each side of the web, and against these the massive links A A are fastened with bolts. These links measure 1ft. 2in. by 3in. in

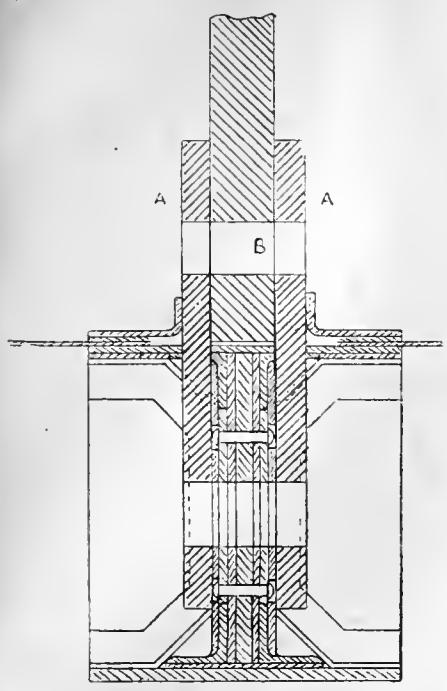

FIG. 232.

cross section to receive suspension pins, the pins B being 6in. diameter. The ends are further stiffened with angles and gussets, as shown. Fig. 233 illustrates another eye-and-pin connection on the same bridge. Whenever the

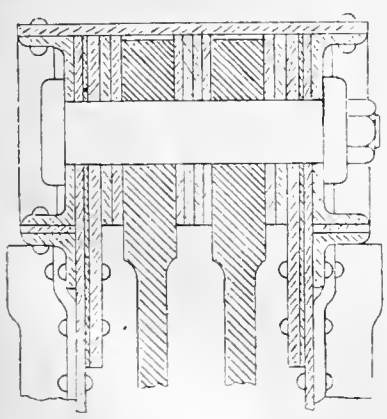

FIG. 233.

original strength of any portion of a structure is reduced by the removal of metal therefrom, it is necessary to reinforce that section in the manner shown in the figures. J. H.

THE SURVEYORS' INSTITUTION.

AT the meeting of the above society on Monday evening last the discussion was resumed on Mr. Punchard's paper (read at the ordinary general meeting of December 10th), on the suggestions for improving the relations between landlords and tenants put forward by the commissioners who have lately reported on the condition of agriculture in the United Kingdom. The discussion was resumed by Mr. Albert Buck, of Worcester, who held a decided opinion that freedom of contract between landlord and tenant was the only practical means of insuring good cultivation and the honest fulfilment of the terms of agreements on both sides. Tenants should be compensated, he held, for farming, which really improved the land, but not for any theoretical claim in cases where they left their holdings impoverished. Much verbiage might have been saved if it had been decided that a tenancy could not be terminated at less than two years' notice to quit, with a proviso that if it were terminated in a less time there should be a claim for compensation. There was, he feared, a tendency to so expand the provisions of the Act as to give the tenant compensation for what he had agreed to do by his lease, and, indeed, was, in common law, obliged to do. He did not think that any great alteration in the procedure for ascertaining the amount claimable and payable was necessary. Arbitration was the only way in which such matters could be decided. If the tenant and the landlord did not agree on the amount to be claimed and paid by one side or the other, someone must decide between them, whether it be a person mutually agreed upon or one appointed by the Board of Agriculture or any other public body. Whether the landlord and the tenant should send in their claims and counter-claims at the same time was a difficult question to decide. He thought, on the whole, that no further legislation could, for the present at any rate, do much good. A land agent should do the best he honestly could for both landlord and tenant, and it was in this way that he would best study his employer's interests.

Mr. E. P. Squarey said that these were generally matters easily settled by a wise landlord, a wise agent, and a sensible and right-minded tenant; and given these conditions, he did not think the Act would be very widely acted upon. But, unfortunately, the three were not always co-existent, and a necessity would, from time to time, arise for dealing at the end of a tenancy with questions of tenant right and compensation. The commission with whose report the paper dealt had a very difficult task. He was not quite sure that Mr. Punchard did not lean a little too much to the landlords' side. It was all very well to seek the aid of the legislature in these matters; but what he thought was wanted was a determination on the part of both landlords and tenants to do what was right and just the one to the other, and not to rely on any details of legislation which might give either of them a technical advantage. As to laying down land for permanent pasture, he thought that the tenant ought, one year before the end of his term, to give the landlord notice whether he intended to claim compensation. With regard to claims for the manurial value of feeding stuffs consumed, he thought that sufficient allowance was not made by valuers for the very different conditions under which they were consumed—whether in closed and properly-drained sheds, or in open yards, or even in open fields, or whether during continuous wet or dry weather, when their value would be very different.

Mr. J. A. Eggar thought that in some ways the present Act might be amended. There should only be two classes of improvements—those which were permanent and those which were exhaustive. The former might well be borne by the landlord. He thought the laying down of permanent pasture, the necessary fencing, and the plant of hops might well be transferred from the first to the second part of the schedule of improvements. If pasture remained good permanent pasture for any number of years, it was probably due to the inherent capabilities of the soil, and not to the tenant's action.

Mr. J. H. Savin and Mr. G. J. M. Burnett having spoken, both agreeing in the main with Mr. Punchard's conclusions, the meeting then adjourned.

It was announced that at the next meeting, on the 24th inst., a paper would be read by Mr. A. A. Hudson, barrister-at-law, on "Surveyors as Arbitrators."

BUILDERS' AND SANITARY FITTINGS.

A VERY compendious and well-illustrated catalogue has been issued by Messrs. George Wright and Co., of 155, Queen Victoria-street, E.C., and Rotherham, comprising nearly every variety of builders' ironmongery, marble and slate mantelpieces, stable and cowhouse fittings, pavement lights, &c. It is impossible to give any adequate idea of the variety of goods and designs illustrated. The marble, wood, and cast-iron mantelpieces contain many good designs in all the chief kinds of marbles and woods, and suitable for every kind of residence. Several very simple designs are shown made in pine, painted, with overmantel, tile panels and hearths, and Berlin black interior. A large assortment or mantel registers of all sizes and prices, some with movable canopies, are illustrated. The grates with removable swing canopy, which acts as a register door, are economical, neat in appearance, and very moderate in price—from £2 and upwards. The kitchen ranges from 2ft. to 12ft. are shown in a variety of shapes, and deserve the attention of all builders and architects who require substantial workmanship. The directions for fixing kitcheners are useful. Several large and very perfect close-fire kitcheners, with grilling stove and hot closets—suitable for large establishments and hotels—steam cooking apparatus, and grilling stoves are shown. The sections on stable fittings and cowhouse fittings contain all the more recent and sanitary mangers and racks and arrangements of stalls. The descriptions and prices of each article are full and complete.

CHIPS.

The building works in New-street, St. Clement's, Ipswich, belonging to Councillor Fred Bennett, have just been extended over the site of an adjoining old malting with garden attached. The additional premises contain fresh machinery, including framed stone-saw, mortar mill, and a crane with 41ft. jib, and plumbing and painting workshops. The New-street works now cover an area of over an acre, and are situate close to the dock and river Orwell, in the oldest part of Ipswich.

A portion of a roadway, believed to be of Roman origin, has been found at Reigate. Some workmen whilst engaged in excavating for a sewer in Nutley-lane discovered a completely-formed roadway about 5ft. below the surface of the highway. The path is about 14ft. wide, and is composed of flints, the edges of which have been trimmed to fit, and is even in character.

Herr Dörpfeld, the Director of the German College of Archæology, who has for some time past been engaged in excavations between Pynx and the Areopagus, believes that he has discovered the ancient system of drainage, with all its ramifications. The pipes, which are in a good state of preservation, conducted to the various quarters of the city the water flowing from Mounts Pentelicus and Hymettus, and the small streams from the Acropolis.

Colonel W. R. Slack, R.E., an inspector of the Local Government Board, held an inquiry at the Town Hall, Leyton, on the 6th inst., into an application by the urban district council for sanction to borrow £2,125 for public street improvements; £7,618 for private street improvements £1,530 for purposes of electric lighting and £1,390 for the purchase of a site for public baths and washhouses.

At the last meeting of the streets and sewerage committee of the Leeds Corporation, Alderman Harding reported that the experiments in the bacterial treatment of sewage which were being carried out at Knostrop, under the supervision of Mr. W. J. Dibden, of London, had had very encouraging results. Daily analyses of the effluent were being made at Mr. Dibden's laboratory and by Mr. Fairley, the city analyst. The experiments are being watched by the West Riding Rivers Board, and analyses on behalf of that body are also being made.

The town council of Longton, Staffs, having applied for sanction to borrow £20,000 for gasworks purposes and £4,075 for purposes of street improvement, Mr. H. P. Boulnois, M.Inst.C.E., an inspector of the Local Government Board, held an inquiry at the town-hall on Friday into the applications. Mr. W. S. Macgregor, the gas manager, explained the plans for improvement at the gasworks, and Mr. J. W. Wardle, the borough surveyor, those for street improvements.

Figures carved in Beer stone, and representing the Evangelists, have been erected over the communion table at St. John's Church, Yeovil. They have been executed by Messrs. Harry Hems and Sons, of Exeter, from designs by Mr. J. Nicholson Johnson, A.R.I.B.A., of Yeovil.

New outfitting premises are in course of erection at Camborne, for Messrs. Vivian Brothers. Mr. Silvanus Trevail, of Truro, is the architect; and Mr. John Colliver, of the same city, the builder.

On Saturday a girls' home at Newport, Salop, was opened by the Bishop of Shrewsbury. The building is intended for the reception and training of friendless girls from workhouses and elsewhere. Messrs. Veall, of Wolverhampton, were the architects, and Mr. Whittingham, of Newport, was the builder.

On Thursday in last week, Mr. R. H. Bicknell held an inquiry at Wednesbury on behalf of the Local Government Board, with reference to applications for sanction to loans amounting to £3,101 for the purpose of a fire-brigade station and other public improvements.

The Goldsmiths' Company, who are the ground landlords of a large portion of the devastated area, have signified their readiness to cordially acquiesce in any scheme the Corporation and the London County Council may arrive at for the improvement of Cripplegate.

OBITUARY.

MR. H. STACEY MARKS, R.A., the well-known painter of birds in numerous attitudes in oil and water-colours, died on Sunday at his residence in Regent's Park, aged 68, after a very short illness. In his earlier years he was a successful decorative painter: he designed proscenium friezes for the Gaiety Theatre and other playhouses, did part of the frieze running round the outside of the Albert Hall, and carried out a good deal of work at Eaton Hall, Crewe Hall, and other private houses. Mr. Marks became an Associate of the Academy—in whose schools he had been trained—in 1871, becoming an R.A. seven years later, and retired a few years ago.

CHIPS.

The Walthamstow Urban District Council having applied to the Local Government Board for sanction to borrow £11,000 for the erection of an infectious hospital at Larkswood Lodge, Chingford Hatch, Dr. H. Timbrell Bulstrode held an inquiry at the Town Hall, Walthamstow, on Tuesday in last week. Mr. G. W. Holmes, surveyor to the council, showed the plans which he had prepared.

The new schools, Farnworth, near Widnes, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

New church schools on Galley Common, Stockingford, built at a cost of £1,400, were formally opened by the Bishop of Coventry on Thursday in last week.

On Thursday, the 6th inst., Mr. H. Percy Boulnois, M.I.C.E., of the Local Government Board, held an inquiry at the Shire Hall, Stafford, respecting an application by the town council for sanction to borrow £20,000 for the purposes of the Stafford Corporation Act, 1806, and £1,000 for water-supply purposes.

On Tuesday, four men who were at work on the new Roman Catholic Cathedral, which is being built in Ashley-place, were thrown to the ground owing to the collapse of the planking of the scaffold they were on. They were so seriously injured that they had to be taken to Westminster Hospital. Their names are—Peter Pennythorne, 28; David Seymour, 28; Frederick Frost, 25; and Arthur Brooks, 30.

The Dean and Chapter of Peterborough Cathedral have requested Mr. G. A. Bodley, A.R.A., to examine and report upon the condition of the west front of the cathedral, and also of the transepts and eastern chapel of the choir, with a view to carrying on the work of restoration. This course is necessary, owing to the death of Mr. J. L. Pearson, R.A., under whose advice the previous restorations have been carried out. Scaffolding is being erected with a view to restoring the south-west gable of the front.

By his will, which bears date September 6, 1895, with codicils of May 26, 1897, and August 28, 1897, Sir Henry Doulton, of the firm of Doulton and Co., potters, left personal estate valued at £309,483 8s. 4d. He bequeaths to the Pottery and Glass Trades' Benevolent Society £100, and to the Lambeth Pension Society £200.

The first annual dinner of the Hereford and District Master Builders' Association, which was established on March 20 last and has now a membership of 13, took place at the Mitre Hotel, Hereford, on Tuesday evening in last week. The chair was occupied by Mr. William J. Bowers, president of the association, who was supported by Mr. Alderman H. C. Beddoe, the Mayor of Hereford, and Mr. A. Krauss, of Bristol, president of the West of England and South Wales Federation of Master Builders. The toast of the evening was proposed by Mr. W. Symonds and acknowledged by the president, and that of "The Architects and Surveyors" was proposed by Councillor James Davies and acknowledged by Mr. E. H. Lingen Barker, the senior architect practising in Hereford.

The Croydon Town Council received on Monday a report from the fire brigade sub-committee as to the result of their investigation into circumstances of the recent fire at the premises of Mr. Horrocks, builder, Croydon, by which damage to the extent of £4,000 was done. They stated that, although they found no fault with the conduct of the brigade at that particular fire, it was proved that there had been great laxity of discipline, and that the men, in defiance of strict printed instructions, frequented licensed houses in the neighbourhood with the knowledge and consent of Superintendent Thomson. They, therefore, recommended that Engineer Bowers and Fireman Filce be discharged, and the superintendent severely censured. Several members advocated the dismissal of the superintendent also, but eventually the committee's report was adopted unanimously.

Building Intelligence.

BRAEMAR.—A commencement has been made with rebuilding the Fife Arms Hotel, Braemar. The plans and specifications have been prepared by Mr. A. Marshall Mackenzie, A.R.S.A., Aberdeen, and a start has already been made with the work. The undertaking will take three years to complete, and in order that the tourist season may not be interfered with, the work is to be done in sections. The first part of the building will be completed in time for the season of 1898.

EDINBURGH.—At the annual meeting of the Royal Infirmary, held last week, a report was presented as to the extension scheme. After consideration, plans for the new pavilion have been passed, and estimates for the necessary works obtained. The amounts of the accepted tenders were as follows: (1) Excavator, mason, and brickwork, £13,648; carpenter and joiner work, £4,980—£18,628; 2 slater work, £377 15s. 3d.; 3 plumber work, £3,188; (4) plaster work, £1,273; 5 concrete work, £2,366 7s. 6d.; (6) tiler work, £3,355 0s. 11d.; (7) smith work, £1,610 3s.; (8) glazier work, £361—total, £31,162 6s. 8d. The pavilion will be five stories high, and will contain basement, three floors of wards, and attics. On the basement floor the new bathing establishment is placed.—In a review of the past twelvemonth the *Scotsman* says:—The building trade has been very busy during the year. Save for the delay caused for a few weeks by the strike of the masons for an eight-hours' day, work has gone on without interruption. The result of the strike was a concession of the men's demand. The eight-hours' day should begin on the 15th February, 1898, but as yet nothing has been done regarding the inauguration of the new system. When the demand was granted, the men were earning 10½d. and 10d. an hour; since then, in most places, the pay has been reduced to the standard rate, 9½d. Besides, the masters have lately purchased machinery to do stone sawing and dressing, equal to a displacement of 200 men. The activity of builders during the year has not been due so much to contract work as to the fact that money has been cheap, that people are removing their money from foreign securities, and that the desire of those people to invest their funds in houses has led to the erection of a great deal of speculative property. Now, however, notwithstanding the extension of the city in nearly all directions, the market is more than supplied, and it is expected that next year speculative builders will take a rest. Besides the large number of tenements, villas, and continuous self-contained houses erected, a considerable amount of public work has been done in connection with the Waverley Station and North Bridge, and new North British Railway Offices, the reconstruction of the Royal British Hotel, the foundations of the North British Railway Company's Hotel, additions to the electric light station, large works at Carson-street, the building of new premises for several assurance offices in St. Andrew-square, the erection of cable-power stations at Tolleross and Shrubhill, additions to the Advocates' Library, a new laundry at the Royal Infirmary, police stations at the Pleasance and at Croft-an-Righ, the public shelter and golf-green keeper's houses on the Braid Hills, and preliminary work for the extension of the Municipal Buildings. The number of warrants, &c., granted in the Dean of Guild Court was 916, which is a great increase over any year during the last five years. They represented 99 villas, 120 self-contained houses, 194 tenements with 138 shops and 2,183 dwelling-houses, 182 public and other buildings, and 319 alterations. As to the prospects for next year, there are the City Hospital at Colinton Mains, not yet above the level of the ground, the new City Chambers, the extra pavilion at the Royal Infirmary, the North British Railway Company's hotel, and, probably, a new central station for the fire brigade.

GATESHEAD-ON-TYNE.—The new offices of the School Board were opened on the 8th inst. These buildings have been erected from designs prepared by Mr. Edwin Bowman, architect, of Newcastle, which was selected in open competition in May, 1896, out of 11 designs submitted, the cost being limited to £3,500. The buildings are of red brick, with moulded and carved stone dressings. The entrance is by a stone portico, with stone columns and entablature. On the ground floor is placed the general office, 44ft. by 19ft., adjoining which are the private office of the clerk of the board, book-kesper's room, telephone room, strong room, and waiting-room. The attendance officers' rooms are placed at the north end of the building, and have separate entrances to them, as well as communication with the other offices. On the first floor, is placed the board-room, 35ft. by 26ft. This room is 15ft. high, with panelled plaster ceiling, and panelled wood dado. Adjoining the board-room is the members' private room, with cloak and retiring rooms thereto. The waiting-room, committee-room, and other apartments adjoin. The rooms are warmed by hot-water pipes and radiators, which is supplemented by open fires in each room. In the basement are store-rooms and the heating chamber. The contract for the building was £3,182, which has been carried out by Messrs. T. and R. Lamb, of Gateshead, under the personal supervision of the architect, with Mr. Wm. Elington as clerk of the works.

GLASGOW. — St. Patrick's Roman Catholic Church was opened last week. The new church is situated at the corner of North-street and William-street, Anderston, and is designed in the Early Decorated style. The nave is divided into seven bays, and is 102ft. long by 30ft. wide. Including aisles, the total width is 59ft. The clerestory is supported by three arches, each of a span of 27ft. These arches are carried by granite columns, so that two columns practically support the weight of the clerestory on either side. In each of the seven bays of the clerestory is a five-light window with traceried head, and in the bays of the aisles, on the Epistle side, are two two-light windows with traceried heads. The west window is divided into seven lights, with traceried head, and is 32ft. high. The baptistery is placed at the end of the aisle on the Gospel side, and is lit by a three-light traceried window, and the confessionals are in recesses in the aisle on the Gospel side. The chancel, which is 32ft. in length, is divided from the nave by a chancel arch, and terminates with a five-sided apse, in each bay of which is a two-light window with traceried head. The side chapels are divided from the chancel by an arch, over which are two two-light windows with traceried heads. Each chapel is lit by a rose window. There are two doors under the great west window, approached by a flight of steps from North-street. The organ-gallery at the west end is reached by a circular stone staircase. The roof, supported by six principals, has a total height from floor to ridge of 67ft., but is ceiled internally at a height of 57ft. Accommodation is provided for over 1,000 worshippers. The presbytery is connected to the church by a corridor from the sacristy. The church and presbytery, which are both lit by electricity, are built of Locharbriggs stone, the roofs covered with slates from the Aberfoyle quarries. The church has cost £9,000. The whole has been designed and carried out under the direction of Messrs. Pugin and Pugin, of London. Mr. Harvie was the inspector of works.

GORBALS, GLASGOW.—The memorial-stone of Gorbals Free Church was laid on the 6th inst. by Lord Overtoun. The church is situated in South Portland-street, occupying a position between two high four-story tenements, thus presenting unusual difficulties in plan and design. These have been dealt with by filling up the whole frontage block with the entrances, hall, and rooms, while the church is placed behind these, being lighted from each side. The church itself is square in plan, with side and end galleries, and will be seated for 918 persons. It is internally divided into a nave and side aisles by iron columns which support the galleries and roof, and steel girders over the galleries divide the roof longitudinally into three sections. The central portion is carried up much higher than the sides, and is finished with a coved and panelled ceiling divided into six bays by moulded timber couples. At the pulpit end two stone piers divide the space into three, the side sections forming organ-chambers, while the centre is occupied by the platform. The pulpit will be an open platform, with only a small reading-desk in front. The church will be lighted by two tiers of triplet windows. The hall is placed on the first floor on the gallery level, and is a room 60ft. by 27ft. 6in. A beadle's house occupies a portion of the upper floor. There are also on the basement two lesser halls, each for 160 persons, a kitchen, store-room, and lavatory; and on the street floor are ladies' room, vestry, deacons' room, and cloak-room, with lavatories, and an extra vestry. The style is Classic, of a severe

type. Each flank of the front is kept forward to the street line, and carried up unbroken to the cornice, so as to contrast with the adjoining tenements, while the centre is recessed a few feet. The stonework is of red sandstone from Gatelowbridge quarries. The estimated total cost is £6,500. The architect is Mr. John B. Wilson, A.R.I.B.A. and I.A., Bath-street, Glasgow, and the work is being carried out under his supervision, with Mr. James Mair as clerk of works.

MANCHESTER.—The Art Gallery Committee presented a report to the city council at its last meeting as to the necessary arrangements and cost incident to continuing the autumn exhibitions. The committee say that they have considered the additional space necessary to enable them to carry on the work of the steadily growing permanent collection, the autumn exhibition, and the other exhibitions which they have been accustomed to hold; and they have come to the conclusion that to adequately meet this requirement they will need increased accommodation equal to that afforded by the existing galleries, which will very soon be only large enough for the permanent collection. "Three possible ways," the report goes on to say, "of obtaining the additional accommodation have been considered by the committee: (1) the erection of a temporary building on land now belonging to the corporation; (2) the sale of the present building and its site, and the erection of a new and larger building on another site; (3) the erection of additional galleries on land behind the present building. Proposal 1 has been rejected as undesirable; proposal 2 has much in its favour, especially if the new gallery could be built on the same site as and in connection with the new reference library; but, on the other hand, there would be very great and general reluctance to consent to the abandonment and pulling down of the present building, which is not only one of the best examples of architecture in Manchester, but also contains a fine suite of galleries admirably adapted for their purpose. Proposal 3 is the one recommended by the committee. If the plot of land between the present building and George-street could be acquired at a reasonable price, it would afford space for a building providing galleries at least equal in extent to the present ones. Communication could be established between the two buildings, so as to form one magnificent suite of galleries sufficient for all needs for very many years to come. The initial cost of the new galleries could be considerably reduced by erecting only a one-story building; or the annual cost could be reduced by reserving the ground floor of a two-story building for offices to be let for business purposes. But it would be much more satisfactory to have a two-story building entirely devoted to the work of the committee, who could make good use of both floors.

MELLOR, LANCS.—St. Mary's Church, Mellor, was reopened on Thursday in last week, after having been renovated at a cost of £3,500. The roof and coping stones have been repaired, the Dodgson monument has been placed inside the church, and a substitute erected over the family vault; and the Hargreaves, Dodgson, and Troy windows have been protected with sheet glass. An organ has been built by Mr. Edwin Smith, of Blackburn. The organ-case is of quartered oak, with spotted metal speaking-pipe front. The keys are of ivory, with overhanging upper manuals, and the key-fittings, desks, &c., are of polished walnut. A new font, with oak cover, has been given, and is a copy of a 14th century font, which was discovered buried beneath one of the porches of the old church at Welshpool. Mr. Varley, of Blackburn, carved the front, and Mr. Harry Hems, of Exeter, the cover. Messrs. Paley and Austin, of Lancaster, were the architects for the restoration, and Messrs. J. Hutch and Sons, of Lancaster, the contractors.

NEWCASTLE-ON-TYNE.—The memorial-stone was recently laid of Erskine Presbyterian Church, Rye Hill. The church, which is to be erected on the old site, from designs and under the superintendence of Messrs. Badenoch and Bruce, architects, of Newcastle, will accommodate 500 persons, an increase of nearly 200 over the old building. It is Late Gothic in style. The walls will be of rubble, having on the main front snecked rock facing and chiselled stone dressings. Staircases lead to galleries, which run round three sides of the church. The roof is of hammer-stone trusses in pitch-pine, with cleaded ceilings following the line of rafters and collars and divided into panels with mouldings planted on. The existing schoolroom in the basement is not to be interfered with, but the front portion under the vestibules will be converted into a ladies' room and tea-room with wide vestibule and entrance lobby, lavatories, &c. The whole scheme includes a hall seated for about 150 on a vacant site to the north of the church, with minister's vestry, and on the basement level there will be infants' classroom, session-room, heating-chamber, and lavatories. The present contract is for the church only, Mr. Robert Veitch, of Barrack-road, being the contractor. The heating will be by low-pressure hot-water pipes and radiators, and the electric light is to be introduced.——The new Primitive Methodist church in Kingsley-terrace, Newcastle, replacing a smaller chapel in West-street, has also been opened. The church has been erected from the designs of Messrs. Marshall and Dick, architects, of Newcastle. The style is Early Gothic. The church consists of nave and transepts, and containing the bulk of the sittings on the ground floor. A small gallery, accommodating about 90, occupies the north end over the entrance vestibule. The total accommodation is for 500. The windows of the edifice are long trefoil-headed lights, and the roof is barrel-vaulted. The rostrum is recessed, and has doors on either side communicating with the vestries and stairs to hall below. In the rear and on the level are arranged the church parlour, the minister's vestry, and the steward's room. The hall in basement occupies about three-quarters of the area of the church above. Folding screens are arranged so that the space can be divided into classrooms. The heating is by low pressure hot water, ventilating radiators being placed in window recesses and elsewhere. An electric fan in the tower will be used to extract the vitiated air, and the buildings throughout are to be lighted by electric light. Mr. T. Hutchinson, Elswick-road, Newcastle, was the contractor.

RUM, N.B.—Mr. George Bullough, proprietor of the Island of Rum, is carrying on important improvements on the island. A mansion-house, the building of which was commenced last summer, is being erected, at a cost of nearly £43,000, on a site facing the entrance to Kinloch Bay, eastward. The main tower is to be 60ft. in height, and the other four towers, which occupy the corners of the rectangular building, 40ft. The basement floor, which contains the wine cellars, larder, and heating-apparatus chambers, is 152ft. by 130ft. On the ground floor is the drawing-room, dining-room, library, and morning-room, boudoir, business-room, smoking-room, hat and cloak rooms, luggage-rooms, servants' hall, and kitchen offices. At the south end there is a conservatory, 23ft. by 36ft. The quadrangle in the centre of the building is 45ft. by 41ft., and to the right of it is the ball-room, 23ft. by 31ft. The entrance-hall is 40ft. by 26ft. On the first floor, besides the upper part of the ball-room, are eighteen bedrooms, dressing-rooms, and bathrooms. The stone employed is red sandstone from the Corrie quarries in Arran. The woodwork generally is to be of oak, and for decorative purposes walnut and mahogany are to be used. The staircases are to be finished in oak, and the bath-rooms and lavatories laid with encaustic tiles. The windows have gun-metal casements, and all the flooring is fireproof, on the Fawcett system. The architects are Messrs. Leeming and Leeming, London. The improvements on the island are not limited to the erection of the mansion. New gardens, greenhouses, and vineries are being formed at the cost of over £5,000. Arable ground near the old residence is being utilised for planting trees, and a large area of hill ground is being drained for farming purposes. Two other contracts have been let—one for the construction of half a mile of avenue leading from the pier to the mansion house, and erecting a bridge over the river at a cost of about £2,000; another of £3,000 for making a communication by means of a canal between a fresh-water loch and the sea, for the purpose of rearing trout and salmon. Another part of the improvements going on simultaneously is the construction of a highway from one end of the island to the other. The estate carpenters are also busy erecting accommodation for 25 horses.

The restoration of Dawlish Parish Church tower is completed, this concluding the whole of the external restoration to the church.

Engineering Notes.

CREWE.—One of the most extensive operations undertaken of late years by the London and North-Western Railway Company is now in progress at Crewe. It will involve the outlay of upwards of half a million of money, and when it is completed the whole system will feel the benefit. Half a century ago Crewe was nothing else than a small hamlet, with a population, in 1831, of 148. To-day it is a borough, with a mayor and corporation, and 35,000 inhabitants. At present goods and passenger trains run freely over the same lines, and the company now proposes to do what it has already accomplished at Edgehill—separate the two classes of traffic; and, next, improve vastly the existing passenger accommodation. Crewe, before the extension, covered 93 acres; on completion of the alterations it will embrace 223 acres; its platforms will be upwards of 4,000 lineal yards in extent, just double the present length; the area of the roofed-in portion will be 40,000 square yards, instead of 12,160 square yards; and its sidings will be augmented in number from 140 to 220, with a total length of 30 miles, in place of 15¼ miles.

MARYLEBONE.—Extremely rapid progress is being made, says *Engineering*, with the London terminal hotel, as with all the works in connection with the Great Central Railway. The hotel facing Marylebone-road is already up to the second-floor windows on all sides, and will be nearly rectangular in plan, the size being about 210ft. in width by 270ft. or so in length from north to south. Red pressed bricks form the material, with terracotta dressings. On the west side are six large windows on the ground floor, with terracotta arches, giving light to a banqueting-room. The Marylebone-road front is to have a central carriage entrance into a covered courtyard, and there will be a subway from the hotel into the station. There will be seven stories, including two in the roof, with a clock-tower over the entrance. Col. R. W. Edis, F.S.A., is architect both of the hotel and the station. Of the latter not much is yet visible above ground, but the foundations are in for a good deal of it, and the ground is fast being excavated. Many lines of rail are laid all over the site, and most of the *débris* of the old houses is gone. The raised road in substitution for Boston-street over the railway at the north end of the new terminus is now finished. The road, which will be 45ft., will go straight on into Lisson-grove, emerging thence by the widening of St. John's-place. Between it and Alpha-road the principal goods-shed or warehouse is situated, thirty-five of its great iron columns being now in position. The girders binding these together at the first-floor level are partly up. Eleven-and-a-half acres of floor space will be provided in the goods station and warehouses. The goods-yard will lie entirely to the west of the passenger lines, and south of the branch which goes under Grove-road to the coal-sidings. The additional room would comprise 400 or 500 houses, mostly of a poor class, the rateable value being only about £9,000. Further out, the tunnel and covered way extending a mile from Wellington-place to the London and North-Western Railway is still under construction, and the further portion, on to Finchley-road, is finished. West Hampstead Station is being rebuilt on the new pair of roads north of the old ones, the latter being handed over to the Great Central, whilst the former will in future be the Metropolitan. West-end-lane bridge, which goes over both lines at this point, is being widened. A little further on the Great Central will be carried upon an iron viaduct, laid upon brick piers, leading on to the bridge over the North London Railway. The viaduct is now being constructed, as are the bridges adjoining Kilburn-Brondesbury Station.

THE JUNGFRAU RAILWAY.—The latest report on the progress of this railway shows that the work of construction is being pushed forward, notwithstanding the severe weather prevailing in Switzerland. Water-power to the extent of 2,400 H.P. is now available at Lauterbrunnen, half of this force being utilised for the dynamos employed in the boring of the Eiger glacier tunnel. The mountain stream has been diverted from its course for a distance of six miles, extending from the waterwheel-house to Scheidegg station and the Eiger glacier, while the open line between the Scheidegg and the glacier, with its

tunnel of 88 yards, is finished, so that the electric railway over this portion will probably be opened in the first half of next June, and in time for the tourist season. The principal tunnel has been carried to a distance of 164 yards by hand-boring, and the preliminaries for tracing out the great tunnel have been accomplished after some two years of labour. The rock is found to be excellently adapted for tunnelling, and experiments on the Jungfraujoch has proved that it is reached at a depth varying from 80ft. to 100ft. under the snow, instead of at 230ft., as was at first expected. In connection with Swiss mountain railways, it may be mentioned that the opening trial of the Gorner-Grat Electric Railway from Zermatt has proved satisfactory. The line was completed a short time ago, and it is to be opened for passenger traffic early in the spring.

COMPETITIONS.

Bootle.—Twenty-two competitive plans for the proposed new fire-station at Bootle have been sent in, and these are now exhibited in the town-hall of that borough. The author of the selected plans will receive as his award the appointment of architect of the buildings, with commission upon the contract; and a second prize of twenty-five guineas is also offered. The scheme, excluding the cost of the site, which is situated in Irlam-road, is not to exceed £15,000, and in the event of the Local Government Board refusing to sanction the borrowing of the money, the successful competitor will receive fifty guineas as remuneration for his work. The present site and buildings of the fire-station, which has proved inadequate for the requirements, together with the old and disused police-court adjoining it, have been purchased by the London and North-Western Railway Company, who intend to establish a goods station there. In the plans of the proposed fire-station, house accommodation has been made for twenty married and ten single men, so that, if necessary, the permanent staff, which now numbers twenty-four, may be increased. Mr. F. T. Turton, deputy land steward and surveyor to the Liverpool Corporation, has been recommended by the Bootle Fire Brigade Committee for appointment as the assessor to adjudicate on the designs. Mr. Turton prepared the plans for the new Central Fire Station in Liverpool, and for that purpose inspected the principal stations in the country.

Carshalton: Southern Convalescent Hospital.—For this important competition for a convalescent hospital, to be built on an estate at Carshalton, for the Metropolitan Asylums Board, 15 architects have entered; but, contrary to the usual rule, Mr. T. Duncombe Mann, the clerk to the Board, has declined to furnish us with their names, as he thinks it would be unfair to allow individual architects to know who they are competing against. It is difficult to understand the grounds for this reluctance to give this information; but the Metropolitan Asylums Board has methods of its own! One thing is certain, and that is that someone has had access to the list of architects invited to compete, and is writing to them offering to assist them in the preparation of their designs! Whether he has had the information denied to us we cannot say. The drawings required are a block plan to ⅛in. scale, and a plan of each floor (unless identical), with elevations and section, drawn to ⅛in. scale. All drawings, it is provided, must be prepared by the competitors themselves or by their ordinary staff, and must be accompanied by a report and a priced statement of the cubical contents of the buildings. Designs are to be sent in without motto or device, and accompanied by a letter, sealed with a plain seal without device, to the clerk to the board on or before March 25, and both letters and designs will be numbered for identification in the order in which they are received. Three premiums of £150, £100, and £50 will be awarded, but by the objectionable rule now becoming too frequent, the first prize is merged into the lump sum which is to be paid in view of commission. The assessor, Mr. Henry Currey, F.R.I.B.A., will (i.) report whether the designs comply strictly with the conditions of the competition; and (ii.) if any design considered favourable for adoption can be carried out at the cost named by the author; and (iii.) advise the works committee generally in their selection. If, in the opinion of the works committee and the assessor, any design should not be in conformity with the conditions and instructions, it will be rejected, and the author shall not be entitled to any compensation. The managers of the board reserve the right to reject the whole or any of the designs should they be deemed unsuitable, to make modifications in the designs adopted, and *to adopt any feature from either of the premiated designs*—the last condition is hardly fair to the second and third competitors. Provision is to be made for 720 patients in thirty double cottages for 21 patients each, in addition to isolation accommodation for 80 cases, and the usual administrative block, laundry, mortuary, workshops, lodge, &c.

Cronstadt.—No adequate designs have been sent in for the international competition for an Orthodox Cathedral in Cronstadt, and, in consequence, a second competition will be held on the same conditions as before. The cathedral, for the especial worship of sailors, is to be built so as to hold a congregation of 4,000 people, and is to cost a maximum of 700,000 roubles. Four designs will be premiated: the first at 5,000 roubles, the second at 2,500 roubles, the third 1,500 roubles, and the fourth 1,000 roubles. These four premiated designs will become the absolute property of the Building Committee of the Russian Ministry of Marine.

Skipton.—The Skipton and District Cottage Hospital competition has just been settled, and the committee desire us to say that the award for the plans is as follows:—1st place, Mr. E. C. H. Maidman, Edinburgh; 2nd premium to Mr. W. F. Edwards, Birmingham. We are informed that the plans were all examined and reported upon by an eminent firm of architects in London, and that twenty-two competed.

CHIPS.

From a report just published as to the work accomplished in 1897 in the Diocese of Llandaff, we learn that on the erection, restoration, or enlargement of churches in the diocese, upwards of £36,000 has been expended within the twelve-month. Further accommodation has been provided for nearly 4,000 persons.

In Bristol and the district the building trade was marked during 1897 by considerable activity, and although few buildings of great importance have been erected in the city, the trade generally has been better than for some years past. Prices have ruled slightly higher and considerably steadier. There have been no serious labour disputes. All classes have been well employed, and the supply of labour has been good.

Those who have visited the Cathedral of Dunblane have had their attention called to three blue slabs in the centre of the choir, marking, as is believed, the burial-place of three sisters who were poisoned at Drummond Castle in the reign of James IV. One of the three, Margaret Drummond, is supposed to have been privately married to the King, and it is certain she bore him a daughter, who became the mother of the fourth Earl of Huntly. On the three slabs referred to there has just been placed, at the cost of the Earl of Perth and Melfort, brasses, commemorative of the tragic fate of Margaret Drummond and her two younger sisters, Euphemia and Sybilla. "Seized with sudden illness while residing at Drummond Castle, they all three died soon after partaking of food, in great pain, and under strong popular suspicion of poison."

The restoration of Wath parish church, near Doncaster, has just been completed. Mr. Fidler, of Eckington, was the general contractor, and the work has been carried out under the superintendence of Mr. Wilfred Campsall, architect, of Sheffield.

Extensive alterations are being made by the Great Eastern Railway Company at their Chelmsford Station. Awnings 250ft. in length are to be built over each platform, new station-master's house, booking-office, &c., provided, a fresh staircase built on the down side, and the lift reconstructed.

Mr. Richard Roberts, builder, the chairman of the Building Act Committee, will not offer himself for re-election to the London Council in March as a representative of South Islington. "Private and business claims," he says, in his valedictory address issued on Tuesday, "render it impossible for me to devote in the future as much time to the work of the Council as I have done in the past." Another well-known builder, also of Welsh extraction, Mr. Howell J. Williams, at present member for Bermondsey, has been adopted by the Progressives of South Islington as Mr. Roberts' successor.

The extraordinary collection of pictures formed by Mr. David Sellar, and recently offered to and declined by the City of London, will be on exhibition at the Grafton Galleries on and after to-morrow (Saturday).

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—A. T. F.—L. and G. N.—H. T. W.—W. B.—R. C. and Co.—A. G.

"BUILDING NEWS" DESIGNING CLUB.

Fourth List of Subjects.

D.—A Small Church for a Hamlet on the Outskirts of a Town. The building to accommodate 300 and a choir of 24 voices. The site falls from W. to E. 10ft., and it is situate at the corner of two roads, with a south frontage of 160ft., and a depth of 100ft. to the second road, which runs N. There is to be a spire at the N.W. corner of the building, and the west entrance is to be through this tower, which will form a porch. There is also to be a south porch, and there may be transepts; but the building is not to be ornate, and it must be adapted to church requirements, and have a choir-vestry, as well as one for the priest. These need not be level with the church. The altar pace is to be seven steps above the nave floor, and the central passage-way up the nave is to be 8ft. wide. The organ must be near the chancel, and not be cramped in a recessed "organ-chamber," so as to impede the sound of the instrument gaining full vent. Material, coursed stone and wrought dressings. Style left to competitors. Roofs open-timbered and covered with tiles. A pulpit and screen to choir to be shown. Scale, 8ft. to the inch for one main elevation and cross-section; other drawings may be 16ft. to the inch. Sketch view desirable. Cost will be taken into consideration; but no precise sum is fixed, though an estimate reckoned at a shilling per foot cube is to be furnished with each design.

Drawings Received.—"Centaur," "Wessex," "Orb," "Gib," "T-Square," "Pantile," "Don," "Derige," "Hotspur," "Suburb," "Phantom," "Eric," "The Maggot," "By Go," "Dachs," "Klondyke," "Checkmate," "Gossip," "Don't Know," "Bernard," and "Excelsior."

Correspondence.

A PARALLEL TO WALTHAMSTOW.

To the Editor of the Building News.

Sir,—With reference to the correspondence which has recently taken place between Mr. Cubitt and ourselves, we beg to say that as we have not received the requisite apology from Mr. Cubitt (some of whose statements appear to

ns to be libellous', we have placed the matter in the hands of our solicitors, Messrs. Wontner and Sons.—We are, &c., SPALDING AND CROSS.

15, Queen-street, Cheapside, E.C., Jan. 12.

WALTHAMSTOW PUBLIC BATHS.

SIR,—Mr. Dunford will not aid his case by continuing to publish untrue statements. We received no "second premium" of 25 guineas, as he very well knows, as in this competition three selected architects were invited to submit designs under the following conditions — viz., "The council will pay a fee of 25 guineas to *each* architect whose plans are not accepted, and an inclusive commission of 5 per cent. upon the contract price will be paid to the architect appointed to carry out the work."

As Mr. Dunford has apparently now completed his series of misleading letters, we beg to give your readers the following additional information which he has, strangely enough, omitted to supply—viz.:

(1) Long before Mr. Dunford's name was suggested in connection with the proposed work, we were practically engaged by the council to prepare the necessary working drawings for the Public Baths. However, one of Mr. Dunford's friends moved and carried, at the last meeting of the council, a resolution to the effect that "before the council sealed the appointment of Messrs. Spalding and Cross, the various public bodies for whom these architects had erected public baths should be communicated with, to ascertain what were the original estimated costs of their baths, and what was the final expenditure incurred." Although replies to these questions were received in due course, the inevitable delay which had been caused had the effect desired by Mr. Dunford's friend, and our appointment was not sealed as the incoming council contained a majority of Mr. Dunford's supporters.

(2) This new council instituted a competition for the work, and appointed Mr. Rowland Plumbe the assessor. After Mr. Plumbe's report was received by the works committee it was *unanimously* decided that we should be "requested to appear before the next committee, and pledge ourselves to erect the baths for the sum named." When this recommendation was submitted to the council a few evenings after, the same active supporter of Mr. Dunford who had prevented our appointment being sealed by the first council, notwithstanding the fact that he had supported the works committee's unanimous recommendation, actually moved and carried an amendment to it, to the effect that Mr. Dunford be appointed architect to the public baths, and that his appointment be sealed by the council.

3. The third council at once rescinded the resolution carrying Mr. Dunford's appointment, on the ground that it was obtained by "a gross act of jobbery."

We may add that we have never been told by anyone but Mr. Dunford that his plans were "placed first in the competition": indeed, the works committee's action *after* Mr. Plumbe's report was received, appears to us to clearly show that if our estimate could be justified, there was no doubt in the assessor's mind as to the respective positions of the two designs.

We do not know to what extent these machinations on the part of his principal supporter were approved or instigated by Mr. Dunford; but we do know that he was prepared to benefit by the results they achieved.

In conclusion, we assert that Mr. Dunford has published misleading and, in some cases, untrue statements in the BUILDING NEWS and elsewhere relative to our own and his own actions in connection with this competition. We have recently seen a very explicit article upon the *facts* connected with this appointment which appeared some time since in the *Walthamstow Reporter*, in which the two successful efforts made by Mr. Dunford's friends to oust us from the appointment are fully described.

We understand that no attempt has been made to refute the statements contained in that article. —We are, &c., SPALDING AND CROSS.

TIMBER.

SIR,—While thanking "A. H." for his endeavour to reply to my letter of the 10th ult., I regret that he has not enlightened me on the matter beyond strengthening my opinion that red and yellow deal are the self-same wood and from the Pinus sylvestris. I fail, however, to see how the names "fir," "pine," and "deal" are each distinguished by the colours red and yellow when he says they all apply to the one tree. It is not likely that the foresters or timber exporters, who know the tree and the red colour of its bark, would term it "red" when the floorboards which are imported ready for laying are termed "yellow." Many carpenters profess to know the difference between red and yellow deal, and although I was at one time a bench hand in the "lang toon" of Kirkcaldy, I must confess my inability to do so.

I am likewise indebted to Mr. Stevenson, whose letter in last week's issue is not only more to the point, but very interesting. It is to be regretted, however, that both he and "A. H." give up the classification of this chaotic subject as hopelessly beyond human enterprise. If, botanically speaking, the tree is a pine, and is not popularly known as such, then we are, and have been all along, in a state of confusion, which confusion, Mr. S. remarks, is part of our language, and cannot be set aside. It is quite evident that the reaction of the rectification of the wrongs at present so deeply rooted must again cause confusion; but that is no reason why—if even only for the guidance of students—we should not strive to adopt a clear and unmistakable classification instead of hazarding the recurrence of another "Babel" calamity. If a carpenter or joiner does not know the botanical name of the wood he is using, then I say the sooner he does know the better. Is it not preferable to be precise in its classification than to be ignorant of it? Mr. S. has slightly misunderstood me. I did not say, nor do I agree with him in saying, that the term "yellow" deal is almost exclusively used in the textbooks, but that the term is almost exclusively applied to floorboards. Taking the majority of textbooks, you will read, for instance, "1in. deal this and 1¼in. deal that," without any distinction as to whether it may be red, white, or blue: but when you come to floorboards you can't get away from it, for there it is, "1¼in. yellow deal floorboards."

Speaking of the balk timber. You neither read of it as red or yellow fir nor find its name derived from its colour, but from the ports of shipment, as Memel, Dantzic, Riga, &c. This also adds to the confusion, and would be overcome if my suggestion were adopted. What is at present termed Dantzic, Memel, and Riga fir balk, or red and yellow deals converted, would simply be "Northern pine," *Pinus sylvestris*, and this ought not to be mixed up with quite a different wood, which in this country is called yellow pine, *Pinus strobus*, and in America, its native country, white pine.

My suggestion of wiping out these old terms or landmarks may be chimerical or Utopian, as Mr. S. puts it; but my reverence for old usages and landmarks is too great to advocate their being swept away, unless, as in this case, they become misleading and dangerous. When terms become confusing in their analysis, and conflicting in practice, it is high time to suggest a reformation, and the only obstacles which may render my suggestion impracticable are the indifference of those who would otherwise adopt it, and the tenacity of those who either do not care to change, or may not realise its ultimate advantages.—I am, &c.,

D. FORBES SMITH.

8, Cann-street, Taunton.

Sir Charles Hutton Gregory, K.C.M.G., died on Monday at his residence, Duchess-street, Portland-place, aged 80 years. He was President of the Institution of Civil Engineers in 1868 and 1869. Sir Charles served in many public capacities connected with his profession. He was employed abroad as consulting engineer for railways to the Colonies of Ceylon, Cape of Good Hope, Trinidad, and some of the Malay territories. In 1894 he married Mrs. Stirling, the famous actress, who died in the following year.

On Tuesday evening the employés of Messrs. Swaine Bourne and Son, King Edward's-road, Birmingham, sat down to a repast, when mutual congratulations were exchanged upon the satisfactory friendliness and good feeling that existed between them—from several for a period of 20 years and more. Congratulations as to the position of the sick club were also made as to its financial position, being able to carry a substantial balance forward. Discussion arose for the further augmenting the annual Hospital Saturday collections by making provision weekly. The meeting concluded by the exhibition of limelight views of buildings, works of art, &c., which were shown by Mr. Kendrick Swaine Bourne by the aid of a biunial lantern, the above taking place at the stained glass works.

Intercommunication.

REPLIES.

[11862.—**Strength of Cast Iron.**—A socketed-joint machine planed would do to unite the iron columns, as the girders bolted to the column brackets would hold them upright. As to the strength of cast-iron bracket, in the case of a girder end resting, the weight of which would be 13 tons, I should prefer a capital, the girder resting partly on the shaft below. A cast-iron bracket would be subjected to a shearing stress, and no rule would be reliable. A wrought-iron bracket or triangular bracket, consisting of a horizontal member bolted to the stanchion and a strut underneath, would be a stronger and more reliable form, and the distribution of stresses on both these members can be found graphically, the first being calculated for tension and the strut for compression. If of cast iron, the web should be 2in. to 3in. thick, and be of sufficient depth to act in compression; but there is always the risk of fracture or air-holes in the metal.—A. L.

[11880.]—**Quantities.**—An architect is not compelled to supply his committee with a copy of quantities, and he may refuse to do so, as they are only supplied for tendering purposes, and for the information of the builder. The architect usually retains the bill of quantities, and if a client asks to see it, he may do as he pleases, though it is not necessary or politic that he should do so. The quantities are generally regarded as part of contract: any error or deficiency, the quantity surveyor is liable for to the owner. Sometimes the quantities are prepared by the architect. Occasionally the condition is inserted that the priced bill shall be deposited by the contractor, and this is the most desirable procedure.—METREUR.

[11881.]—**Floor Calculation for Loads.**—By making a plan of a floor 60ft. square, with the positions of the two main girders and the columns supporting them, it will be easy to compute the load carried on each beam. Drawing through the centres of the four columns lines parallel to both walls, it will divide the area into nine parts or squares, each about 20ft. square. One of the girders will carry an area 20ft. by 20ft., or 40 sq ft., and if we say the load on each square foot is 4cwt., then the load on each of these areas of 400sq ft. will be 1,600cwt., or 80 tons. This will be equal to a distributed load on each third of the girder on the columns of 80 tons, or on the whole girder of 60ft. long of 240 tons. The other main girder will carry the same load. Of course, the columns divide the length into three parts, and each part may have a girder proportioned to it, or 80 tons distributed.—G. H.

CHIPS.

Between 4,000 and 5,000 persons visited on Sunday afternoon the Passmore Edwards Art Gallery and Technical Institute in Peckham-road, opened on the previous Thursday by Sir E. D. Poynter, P.R.A.

A new hotel is in course of erection at Felixstowe for Messrs. Tollemache Brothers. The contractor is Mr. Fred. Bennett, of New-street, St. Clement's, Ipswich.

Mr. Harry Hems, of Exeter, is leaving England at the end of this month for Pietermaritzburg (Natal), for the purpose of being present at the wedding of his third son, William.

Sales amounting in all to £17,285 were held during last week at the Estate Mart, Tokenhouse-yard.

Mr. Henry Charles Heath, of Pall Mall East, miniature painter to the Queen, died at his residence, Greeneroft-gardens, South Hampstead, on Thursday in last week, in the 74th year of his age.

At Malpas, a new organ, built by Messrs. Lewis and Co., of Brixton, S.W., at a cost of £350, was opened at the parish church on Thursday in last week.

A memorial is being raised by past and present members of Jesus College, Oxford, and other friends to the late Rev. Llewelyn Thomas, Vice-Principal and Fellow of that college, who died on May 12 last, almost immediately after he had been appointed Canon Residentiary of St. Asaph Cathedral by the Crown. It is intended that the memorial shall take the form of a window in the college chapel.

The building trade in Hull was unusually brisk during the past year, and almost every part of the city shows increased signs of the march of the builder. Land is improving in value, but the price is still low. Materials have been dear, and in some cases difficult to obtain. The speculating builder has found the Hessle-road district the most suitable for his operations, and certainly the most lucrative.

The Corporate Property Committee of the Leeds City Council have decided that all the unsold land on the east side of Victoria-avenue, Ivy House Estate, containing an area of 10,629 square yards, be sold to the sanitary committee for the purpose of the erection thereon of dwellings for the accommodation of persons displaced by insanitary area schemes, at the price of 1s. 9d. per square yard.

At Friday's meeting of the Driffield Board of Guardians, a letter was read from Mr. Jos. Shepherdson, architect, Driffield, asking the indulgence of the board for a time in the matter of the new workhouse infirmary, the plans for which had been burnt in the fire at his house on Christmas morning.

HIGH SCHOOL FOR GIRLS, SHREWSBURY.—"SPRING": ROYAL ACADEMY PRIZE DESIGN.—MOBBERLEY CHURCH, CHESHIRE.—NEW BANK, LOUGHBOROUGH.—BRONZE MEMORIAL TABLETS OF LEIGH HUNT AND CHARLES KEENE.—"THE HEDGEHOG" INN, NOTTINGHAM.

Our Illustrations.

HIGH SCHOOL FOR GIRLS, SHREWSBURY.

THIS building, for day-scholars only, is erected partly on and below the old town walls, the level of the ground being some 15ft. below the street, sloping rapidly away at the back. This has allowed of an upper and lower ground-floor plan, the pupils' entrance to the latter being by a sloping way under the main entrance from the street. The assembly hall is 33ft. high, with corridor and gallery on three sides. The elevations are faced with "Heather" Leicestershire bricks, relieved with stone bands and oak framing. The gable of porch contains the sign and motto of the Company: "Knowledge is now no more a fountain sealed." Mr. A. E. Lloyd Oswell is the architect.

"SPRING."

THIS is the cartoon of the principal group in a design which gained the prize (£10) for Decoration of a Public Building at the Royal Academy Schools in December. The design, of which this is a part, is to fill a lunette with a door cut in it, being the shape of one of the spaces still undecorated in the walls of the refreshment-room at the Royal Academy. The group herewith reproduced from the full-size cartoon is the central group of the whole design, and represents Spring as an infant standing in the lap of Mother Earth with outstretched arms towards the groups of attendant girls on either side, who do not come in the cartoon. ELEANOR F. BRICKDALE.

MOBBERLEY CHURCH, CHESHIRE.

THE Priory of Mobberley, an establishment for regular canons founded in 1206, has long enough ceased to exist. The piscina and sedilia in the church are the only remains now existing, and they consequently give some interest to the sanctuary, which is divided off from the roof by a quaint rood loft. There is a painted parchment monument to Thomas Mallory, the possessor of the Old Hall in 1713, whose memorial has been decorated to look like marble. There is also a brass in the church to James Stanley, 1674; but the building gains its chief interest by its picturesque situation, and this Mr. Walter Prince has realised in the accompanying pen-and-ink study of the old square tower and wicket to the churchyard leading up from the roadway.

HAMMERSMITH PUBLIC LIBRARY: LEIGH HUNT AND CHARLES KEENE MEMORIAL BRONZE TABLETS.

WHEN Mr. Passmore Edwards presented the Public Library which he built at Shepherd's Bush to the parish of Hammersmith, the building* was dedicated to the memory of two very distinguished men who for years resided in the parish, and besides erecting a memorial cartouche on the exterior of the building, Mr. Passmore Edwards also commissioned Mr. George Frampton, A.R.A., to execute two bronze portraits of Leigh Hunt and Charles Keene. These have been placed in the entrance-hall of the library, and are set on Seina marble slabs, pleasingly-shaped in outline, making exceedingly artistic and valuable additions to the building. We illustrate both tablets to-day. That of the great *Punch* artist was exhibited by Mr. Frampton at the Royal Academy, and both are admirable portraits. Few of our readers have any idea probably that Charles Keene sketched architectural subjects; but we hope at an early date to be enabled to give one or two typical examples promised us by Mr. Fisher Unwin when we notice his monumental volume "The Work of Charles Keene," by Mr. Joseph Pennell, just published.

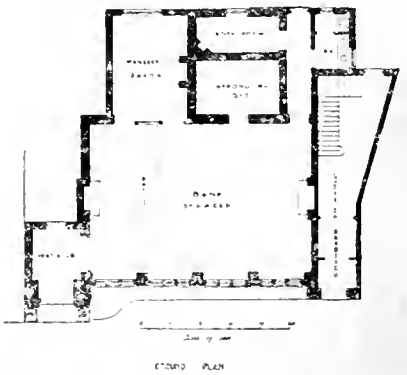
THE LEICESTERSHIRE BANK, LOUGHBOROUGH.

THE new premises of the Leicestershire Banking Company, Limited, occupy a commanding position in the Market-place, all the bank offices being placed upon the ground floor. Above them



are suites of private offices, and a caretaker's residence. The plinth is of polished red granite, above which the front is of Portland stone. The general contractors were Messrs. Moss and Son, of Loughborough, and Messrs. Goddard and Co., of Leicester, are the architects.

"THE HEDGEHOG" INN, NOTTINGHAM.

THE above has been rebuilt on the site of the old inn in Camoch-street with red sand-bricks, stone facings, tiled roofs, with heavy wood cornice at eaves and leaded lights. In excavating, the builders found the old town wall and bed of the old moat or "leen." The architects are Messrs. Brewill and Baily.

Thursday next is fixed for the dedication of the Battenberg Memorial Chapel in Whippingham Church. The Bishop of Winchester will be the officiant, and the Queen is expected to be present.

The council of the Honourable Society of the Cymmrodorion, in response to a request by the Prince Llewelyn Memorial Committee that the society should undertake excavation work at Abbey Cwm Hir, with the object of discovering the grave of "Llewelyn Ein Llyw Olaf," has appointed a committee to report upon the best means of carrying out the scientific exploration of the abbey ruins.

A Bill to incorporate the Bideford and Clovelly Railway Company has been deposited at the Private Bill Office. The proposed company seeks power to construct a railway ten miles three furlongs in length, commencing in the parish of Abbotsham by a junction with the authorised Bideford, Westward Ho, and Appledore Railway, and terminating at Clovelly. The railway may be constructed and worked as a light railway on a gauge of 3ft., but with power to increase the gauge to the usual width of 4ft. 8½in. The capital proposed to be raised for the construction of this line is £50,000.

A Bill to incorporate a company for the purpose of constructing a railway from Windsor to Ascot has been deposited at the Private Bill Office. The proposed railway, which will be just over 10 miles in length, is intended to commence by a junction with the Windsor branch of the Great Western Railway, and to terminate at Sunninghill by a junction with the Ascot and Aldershot branch of the South-Western Railway Company. In connection with this railway it is proposed to construct a road leading to the entrance to the Ascot grand stand. The capital proposed to be raised is £549,000.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

THE ARCHITECTURAL ASSOCIATION OF IRELAND.—A general meeting of this association was held in the Grosvenor Hotel, Dublin, on Jan. 6. The president delivered a lecture on the "Artistic Treatment of Architectural Perspective." He illustrated his remarks by reference to original drawings by Messrs. J. Raffles Davison, J. Coleman, C. W. English, and himself, lent by various architects. The lecturer also showed some etchings, pointing out the error into which many draughtsmen fell, that of imitating the methods of the etcher. He also laid stress on the almost invariable neglect of tone in architectural drawing, whereby much work, otherwise of considerable merit, was spoilt.

CHIPS.

The Canadian Pacific Land Department sales for 1897 show the largest increase on record, 200,000 acres being sold for 650,000dol., while in 1896 only 88,000 acres were disposed of for 307,000dol.

Probate has been granted of the will of Mr. John Bagnold Burgess, R.A., of 60, Finchley-road, who died on November 12, and the value of whose personal estate has been sworn by the widow at £24,500.

At St. Barnabas' Church, Ashley-road, Bristol, under the direction of Mr. F. Bligh Bond, a new pulpit, low screen, altar-rail, and other improvements in the sanctuary and choir have been carried out. A special dedication service has been held by the Lord Bishop of Bristol.

Since May, 1894, when the Building Fund for the Westminster Cathedral was started, £64,114 has been subscribed. Promises representing another £18,000 have also been received, making a total up to date of £82,914. Of this sum £34,964 has already been expended upon the building, under Mr. J. F. Bentley's direction, and from his plans, leaving £29,147 in the bank. The total cost of the structure will be about twice the sum which has been subscribed at present.

The last of the cob-walled and thatched-roofed chapels in Cornwall, that belonging to the Bible Christians at Trelyon, is about to be modernised and provided with a more permanent covering.

The past year has been an unwontedly busy one in Sheffield. The number of plans submitted to the city council for approval for houses, saleshops, and property of every description has been 1,429, and the number of houses sanctioned in the plans has been 2,320, while 480 other proposed buildings have been approved.

A new Jubilee tenor bell has been dedicated at St. Martin's Church, Broadwater Down, Tunbridge Wells. It weighs 11¼cwt., was cast by Messrs. Taylor, of Loughborough, and replaces one of 6½cwt., cast by another firm in 1866, and which was impaired in tone.

The tower and baptistery which the congregation of St. Martin's Church, Potternewton, Leeds, have erected as a memorial to the late vicar (the Rev. R. G. P. Bullock) were dedicated on Thursday evening in last week by the Bishop of Ripon. The tower is 50ft. in height, and 16ft. square inside.

A feu has just been taken off at Drymen, N.B., for the erection of a Cottage Holiday Home for the Scottish Girls Friendly Society. This home is to be built by Mr. and Mrs. William Ewing Gilmour, in memory of their deceased eldest daughter, and will be named, "The Jessie Campbell Gilmour Cottage Holiday Home." The building will cost about £3,000.

The Victoria Library, which is the new branch at Heaton to be presented to the city of Newcastle-on-Tyne by Alderman W. H. Stephenson, is now in progress, and expected to be completed about midsummer next. It is being erected by Messrs. J. and W. Lowry from the designs of Mr. Dyson, Grey-street, Newcastle.

The building trade in Leeds was very busy during 1897. The new houses approved rose to 2,062, as compared with 1,570 in 1896 and 1,122 in 1895. The new factories built were 63, as contrasted with 36 in 1895; while the aggregate number of plans passed was 3,252, as compared with 2,082 in 1895—a leap of over 50 per cent. During the year the estimated population rose from 198,659 to 203,599, and the rateable value from £731,457 to £755,798. The year witnessed the opening of the Municipal Technical and Art Schools, which had been built at a cost of about £50,000. At their successive meeting, the corporation voted £68,000 for an addition to its lunatic asylum, £68,000 for the extension of the gasworks, £30,000 for a public park, £55,000 for an infectious hospital for 160 patients, £30,000 for an extension of the electric lighting plant, and about £60,000 more for street improvements, baths, branch libraries, and destructors.

LEGAL INTELLIGENCE.

OVER A HUNDRED SUMMONSES AGAINST A BUILDER.—At West London Police-court on Saturday Mr. Rose disposed of a batch of 105 summonses against Mr. Joseph Wilson, a builder, issued at the instance of the London County Council with reference to the erection of 21 houses in Stephendale-road, Fulham. The complaint against the defendant was that he had used in the erection of the houses bad mortar and bricks, and had been guilty of other offences under the Building Act. Mr. Seager Berry, who represented the Council, said the defendant had carried out remedial works, and was doing all he could loyally to complete them. Mr. Macmorran, Q.C., for the defendant, agreed to the arrangement, but mentioned that the remedial works had cost him £1,000, which was rather hard upon him, as the houses were erected under the supervision of the district surveyor. Mr. Rose then fixed nominal penalties in each group of summonses, amounting in the whole to £4 4s., with 18 guineas costs.

THE BUILDING OF A WORKHOUSE: DREW-BEAR V. THE ST. PANCRAS GUARDIANS.—Another stage has been reached in this protracted arbitration case this week, when the action came once more before Mr. Justice Ridley sitting in the Queen's Bench Division. We reported the earlier phases of the case in our issues of July 17 and 24, and November 20 and 27, 1896 (pp. 98, 133, 755, and 769, Vol. LXXI., and January 22 and 29, March 5, 12, and 19, 1897, pp. 149, 185, 365, 379, and 413, Vol. LXXII.), when it was originally heard at the Old Bankruptcy Court, Portugal-street, W.C., before Mr. Edward Ridley, Q.C. (as he then was, now the Hon. Sir Edward Ridley, one of the Judges of the Queen's Bench Division) sitting as Official Referee. It was, it will be remembered, brought by several builders' merchants, suing as trustees of creditors of Mr. William Brooks, of Folkestone, builder, against the Guardians of the Poor of St. Pancras, and their architects, Messrs. A. and C. Harston, for a balance of £24,226, or alternately £24,265, alleged to be due on a building contract for the completion of St. Pancras Workhouse. The case for the plaintiffs was that some years ago the St. Pancras guardians resolved to reconstruct their workhouse premises in King's-road, Pancras-road, and appointed Messrs. Arthur and Christopher Harston, of Leadenhall-street, E.C., as their architects. The original contract for certain sections of the work was undertaken by Messrs. Kirk and Randall, of Woolwich. Disputes arose, and in 1892 Messrs. Kirk and Randall desired to be relieved of further duties under the contract; fresh tenders were invited for the completion of sections 1 and 2, and that of a Mr. William Brooks, of Folkestone, was accepted for £50,861. Brooks's contract was to have been completed in 15 months from May, 1892; but delays arose, and in November, 1894, the work was stopped. Messrs. Drew-Bear, Perks and Co., 71A, Queen Victoria-street, E.C., who supplied the ironwork, Mr. Henry Tolputt, of Folkestone, who supplied the timber, and Mr. James Brown, of Cannon-street, E.C., and Braintree, who supplied some of the bricks, then sued as trustees of the creditors of William Brooks for £24,226, or alternatively £24,265, balance alleged to be due to Brooks. After a hearing extending over 24 days, the Official Referee gave judgment on March 17, 1897, for plaintiffs as against the guardians, the damages to be ascertained hereafter, and for the architects as against the plaintiffs with costs. Against this an appeal was made by the guardians to a Divisional Court, and was heard by Justices Grantham and Wright on April 13 last year (see p. 579 in our issue of April 16 last). They decided that the judgment as against the guardians ought to be set aside, and that the case should be re-tried before another Referee. The plaintiffs in turn appealed, and the Court of Appeal, consisting of the then Master of the Rolls (Lord Esher) and Lords Justices A. L. Smith and Chitty, as reported in the BUILDING NEWS for May 21, p. 737, reversed the judgment of the Court below, Lord Esher remarking that the judges had "given a decision which was absolutely wrong." The Court of Appeal further ordered the case to be remitted to Mr. Justice Ridley, as he now was, to decide the amount of such damages as could be proved to be the result of delay in gaining possession of the site, and of interference by other contractors. In November, counsel for the defendant guardians again appealed to Lords Justices A. L. Smith, Rigby, and Henn Collins to allow the case to go before another Referee, as Mr. Justice Ridley would not be able to take it; but, as reported in our issue of Nov. 5 last, p. 670, the application was refused, their lordships practically saying—although, of course, not in so many words—that no other referee could be expected to disentangle so complicated a skein, and that if their brother Ridley had not time, he must make time to settle the matter. The action accordingly came on for hearing once more in Queen's Bench Court No. 2 on Tuesday, and is still in progress as before; at the opening the learned judge said that the case must be finished this week, and that if necessary he should sit till a late hour on Saturday to conclude the hearing. Mr. Reginald M. Bray, Q.C., appeared for plaintiffs, and Mr. English Harrison and Mr. W. Moyses for the defendants. Mr. Bray, in opening the case, recounted the facts, which were probably pretty familiar to the learned judge. Mr. Bray explained that the heads under which damages were now claimed were as follows:—A. and G., in consequence of the contractor not being able to have full possession of the site, and not being allowed to continue in possession thereof, and the failure to get possession of Block A within six months from the date of the contract, caused the labour to exceed what should have been its proper cost by at least 25 to 30 per cent., being an excess on the whole of the contract of from 10 to 12½ per cent., exclusive of any rise in the price of labour or any excess of price paid for materials from same cause was, say, 12½ per cent. on the price paid. This labour was reckoned by the plaintiffs' accountants at £28,631, and by the defendants' experts at about £26,000; but for plaintiffs' purposes of claim the former sum was assumed, the item of damage under this head thus working out at £6,357. For the increased price of labour paid to men from and after September 1, 1893, when there was a general rise in wages of a halfpenny an hour, another £1,210 was claimed, plus £121, the 10 per cent. profit which a contractor looked to obtain. A further sum of £1,000 was claimed as loss sustained by the contractors in making good work injured by such delays, and interference by sub-contractors. Under B, £1,555, plus 10 per cent. profit, was claimed for increased cost of materials from 1st September, 1893, occasioned by the general rise in prices, and under C and D, £3,814 was claimed as establishment charges, increased loss on plant, and cost of supervision, being 7½ per cent. on the contract. Under head E, 1½ years' pay at £1,000 a year, or £1,250, was claimed by reason of the contractor being obliged to give his attention to this undertaking for 18 months longer, owing to delay, than was originally estimated and allowed. Head F. dealt with the fact that the contractor had to employ additional capital over a much longer period, involving increased interest on considerable sums of money remaining idle, and for this a further sum of £1,250 was claimed. The last head, H, was a claim of £160, being 10 per cent. for the loss of profit on the portion of contract for chaplain's room, &c., which had been estimated to cost £1,600. These items, under the several heads A to H, amounted in all to £16,872. The first witness was James Brown, builder, of Cannon-street, E.C., who on being sworn said he had carefully gone into the estimates of damages occasioned by alleged breaches of contract. The first item, £6,357, was set down for increased outlay caused by increased price of labour due to difficulties in working. The most important factor in such a contract was that the contractor should be given uninterrupted possession of the entire site. In this case the area was comparatively limited, and there was a considerable rise towards the north-east. It was, therefore, almost impossible for a builder to commence operations except in one way—namely, to secure several entrances at the lowest point, and be able to level the whole site down to a common plateau. This would save expense and labour, and would enable the foreman to keep his men together. Witness had not a doubt that the contract sum was amply sufficient to complete the work. The conditions on which the contractor was asked to begin on Block C were impracticable. The fact that the mortar-mill had to stand on a mound 7ft. or 8ft. high was most inconvenient. As the old buildings were pulled down there was absolutely no space on which to stack or sort the old materials, portions of which were to be reused in the new works. Moreover, the builder was confined to one out of four blocks, so that the men could not be shifted to a second block in case of any stoppage. He estimated that the labour bill for work carried out in this fashion would cost at least a third more than if done in ordinary way. Mr. Bray: Suppose, for the sake of argument, that the agreed amount of the labour bill is £28,631, what would be the amount of damage? Mr. English Harrison objected to any question of figures being gone into, and in the course of a heated argument it transpired that the defendants claimed that the labour bill should be only £26,000, certain items of joinery done at Folkestone being objected to. The learned judge overruled the objection, and urged that both sides could surely agree on such a matter of figures as a labour bill. Witness, continuing, said it would not be a third of the amount, as certain items would not be affected, reducing the total to, say, £22,000. He estimated the extra cost roughly at £7,000; but if the sum claimed by plaintiffs was £6,370, that would not be an over-estimate. While the works were in progress, there was in May, 1893, a rise of a halfpenny an hour in various works, and also in materials; these, of course, added to the cost. Passing on to the condemnation of columns in blocks C and H, the witness said if the builder had had possession of all blocks, the condemnation of iron columns in one block would not have materially delayed the work, nor have made any difference except inconvenience. The whole of K block was carried out as an independent work after the blocks in front of it had been completed, and this clearly added to the expense. To these items should be added the profit of 10 per cent. which a contractor hoped to gain, and which should have been more on this undertaking. Witness also referred to the delay caused by the well-sinking, which precluded the builders from getting on with the work; more time was lost in the diversion of water-mains from the site, while blocks C and H were cut about by the independent hot-water fitters. He estimated the damage accruing from these three sources at £1,000. As to increase in establishment charges, witness's experience over many years was that they should come to 5 per cent.; but in this case, owing to delay, they would be doubled within a fifth, or say £2,000. The plant should have done two such jobs; but to double the time was equal to its use on two contracts, and he should add another 2½ per cent. for this item, and something more should be put on for supervision. Another 10 per cent. profit had to be allowed on the chaplain's house, which was not carried out by the contractor, and which building had been estimated at £1,600; certainly another £160 should therefore be allowed for this item. A further sum of, say, £1,000 a year should be allowed a contractor if he was kept on such a contract 2½ years instead of 15 months. When the trustees took on the contract, materials valued at £4,000 were taken over, and a large proportion of these materials was held over owing to delay, and this continued all through the contract. For this and the delay in paying over the retention money another £1,250 should be allowed. Witness was cross-examined by Mr. English Harrison with a view to show that the difference in levels between the available entrance and the point witness would have preferred was not so great as had been suggested. Many of the old buildings were pulled down before witness saw the site. The point was that the contractor had but one entrance, whereas there should have been three or four, and at the least two. Passing on to the work of construction, witness said that two blocks ought to have been in progress at the same time. He was asked whether much of the delay in the later portion of the work was owing to the action of the architects or the clerk of works (which the Court of Appeal had decided must not be taken into account), but witness said he had also allowed for this in making his calculations. He could not give the exact figures on which he based his calculations; they were founded on experience as a builder of between 40 and 50 years. Three per cent would be an insufficient allowance for establishment charges. Even if Brooks left the supervision to his manager, Fearon, he was entitled to be paid for supervision, because while the St. Pancras job was going on he was prevented from undertaking other work. In witness's business many works were carried out from beginning to end without his ever seeing them, and that was the *modus operandi* with all builders in a large way. Re-examined: The trustees of the creditors took the place of Brooks during the latter part of the job, and found the money for it. Thomas Lawrence Fearon, manager to Brooks, said if he had had possession of the whole site from the first, he should have put a hoarding round the whole as per contract, and should have made entrances as required, and should have excavated the whole site to the required levels. The total labour bill was £28,631, of which about £2,000 was for joinery done at the Folkestone shop, and, with other deductions, the bill would be about £22,000; he should put down the loss owing to delay and interference at about 20 per cent. on this £22,000. Witness gave particulars of the alleged interference with the work by independent sub-contractors. After September 1st, 1893, when the works should have been completed, there was an all-round rise of 10 per cent. on all materials and labour due to advances granted in the May of that year; of course, all increases of wages and in cost of timber, boards, slates, and bricks which occurred between May and September, while the contract was in progress was, as usual, borne by the contractor. The total amount, as shown in many cases from invoices produced, was £1,550, and on this he was entitled to another 10 per cent. as profit, or £155. He had estimated the establishment charges at 3 per cent., and this should be charged for all the additional time involved. Mr. English Harrison said he objected to the whole of this evidence, as it necessarily included the delays due, as was admitted, to the acts of the architects and their clerk of works, and by the judgment of the Court of Appeal he submitted that his lordship was prohibited from going into any question as to the consequences of the architects' acts. The learned judge said he should not allow the judgment of the Court of Appeal to hamper him in trying the case. The commonsense plan, and the one which he meant to follow, was to hear the evidence as to all delays and interference, and to make a deduction for everything due to the acts of the architects and their clerk of works, allowing the plaintiffs only the sums due, if any, to the acts of the guardians. He

would make a note of Mr. Harrison's objections. Witness, proceeding, said his own salary as manager was £350 a year, and Brooks's average profits for the three years preceding 1895, as shown by balance sheets made out before the contract stopped (now produced), was £1,250 a year. Cross-examined: The particulars in the "heads of damages" were rough calculations made since July last, and the figures now given were detailed estimates made during the past week. He adhered to all the evidence given at the previous trial. He was closely pressed as to the ground plans submitted, with a view to show that they were inaccurate as to the basements of the old work, and also to show that another and more convenient entrance could have been used: but he adhered to the statements already made. Witness was further cross-examined at great length as to the prices of materials and wages paid, and produced his books and receipts. Some of the profits shown on balance-sheets were found on completion of works begun in previous years, and in the same way other expected profits on works in progress were carried forward. John Thomas Chappell, a contractor for 35 years, now out of business, said he had carried out many large works, including Cane Hill Asylum and Manchester Asylum (each £210,000), Camberwell Workhouse, General Post Office £140,000, Baron Grant's mansion £80,000, and Colonel North's house at Eltham over £80,000. Witness had examined St. Pancras Workhouse, and had inspected the contracts and the plans and specifications. The difficulty in getting possession of site and entrances on convenient levels would disorganise the whole business, and materially affect the opportunity of making a profit Witness described in detail the order in which he should have carried out the works, provided the site was placed at his disposal uninterruptedly. The entrance provided was in a dangerous situation, and was the worst portion of the site. Again, the organisation of men, and turning them on from one block to another was everything in an extensive contract. If bricks were condemned for facings, but could be utilised for internal work, as alleged, it would obviously have been a convenience if there had been space on which to store, stack, and sort them. The learned judge remarked that many of the bricks were rejected from samples, and the bulk was not allowed to enter the works. Mr. Bray said that, according to the evidence already given, a greater number were passed over at the works, and were utilised for other work. Witness continuing, said there was sure to be some waste in handling such materials as bricks, due to want of space; but the major portion of the loss would be in labour, which was greater than would appear at first sight. In a work of this kind, costing £50,000 or more, where about £12,000 worth of work was to be done by independent contractors, over whom he had no control, he should have estimated the loss by delay and interference at not less than 5 per cent., and probably more. H. Holloway, of Battersea, said he had had twenty years' experience as a builder. He had inspected the St. Pancras workhouse, and also the plans and drawings, and considered the heads of damages. He agreed with the conclusions of the last witness. This witness was cross-examined by Mr. Moyses, but adhered to his estimates. H. H. Bartlett, sole partner in Messrs. Perry and Co., of Tredegar Works, Bow, a contractor of thirty years' experience, corroborated the evidence of the last two witnesses as to the increase demanded in cost and time that would be involved by difficulties in obtaining possession and interference deposed to by the first two witnesses. With slight modifications, he should have carried out the work as the witness Chappell proposed. The extra cost for delay and interference he should set down at from 8 to 10 per cent. over the whole amount on the actual cost. There was, in the middle part of 1893, a general rise in materials all round, but he could not estimate the amount, as with his experience, witness should have made provision beforehand—that was supposing storage ground existed on site. Of course, if they had to be delivered from other stores, the price would have been considerably increased. The charges for depreciation of plant and for supervision were perfectly fair, and for additional establishment charges for the fifteen months' delay from 5 to 7½ per cent. Cross-examined by Mr. Moyses: Witness carried out the first asylum built from Messrs. Harston's designs—that at Darenth—and had had considerable experience of this class of work. The sub-contractors ought to have been under the control of the contractors. In cases of interference, the architect was the person to smooth difficulties with sub-contractors over; but in witness's experience, complaints made to the architect produced very little effect. The learned judge asked how many more witnesses plaintiffs proposed to call. Mr. Bray: Eight or nine. The learned judge intimated that he did not propose to hear any further evidence of the same class from builders. Mr. Bray said in that case he would only call one other contractor, Brooks's predecessor on this job, William James Renshaw, manager and partner with Messrs. Kirk and Randall, of Woolwich, who carried out the first section of the workhouse, and concurred with the previous witnesses. The prices in Brooks's bill of quantities were very fair indeed, and ought to have yielded a profit of about 10 per cent. under fair conditions. The cost of labour on the amount, guided by experience on the first part of the contract, ought not to have been more than from 42½ to 45 per cent., or about £17,000 on the £37,795, the actual cost of work carried out by Mr. Brooks. To that he added £1,000 for the rise on labour prices to September, 1893, and £2,000 for losses on work rejected, making £20,000 as the full amount, and if the actual cost of labour to Brooks was, according to the pay-sheets, £28,631, then the loss to Brooks due to interference and delay was £8,630, a very moderate estimate of the loss under these heads. At this stage the court adjourned until to-day (Friday).

WATER SUPPLY AND SANITARY MATTERS.

BOMBAY.—Extensive sanitary improvements are about to be undertaken in the city of Bombay, more especially in respect to the removal of insanitary dwellings and the prevention of overcrowding. The new scheme provides not only for opening up crowded localities, the construction of new streets with frontages for the erection of improved dwellings, and the levelling up of low-lying areas, but for improving existing dwellings and housing large numbers of the poorer classes in new buildings to be let at an extremely low rent. Vacant lands to the north of the city will be laid out, and, where necessary, filled in. Some areas west of Colaba are to be reclaimed, and will provide for residences of a superior class. It is proposed to create a special agency, with a separate staff, to devote their entire energies to the particular task before them. The entire cost will not be less than 3½ million pounds sterling, and may possibly amount to double that sum. The corporation still have to complete drainage scheme, control of civic finance, the water supply, the care of roads and streets, the public lighting, and many other duties.

BO'NESS.—The burgh commissioners of Bo'ness have accepted the offer of Mr. Thomas Peattie, contractor, to construct a large new reservoir on the estate of Lochcote, situated between Linlithgow and Bathgate. The contract amounts to £11,500. The reservoir will cover about 45 acres of ground and hold two hundred million gallons of water. The source of supply is the Wardlaw and Brunton burns, the waters of which will be impounded. The quality of the water is said to be excellent. The land which the commissioners purchased cost £7,000, and the laying of a main pipe from the site of the reservoir cost £3,615, and these sums, added to the cost of the reservoir, bring the total cost of the works up to nearly £25,000.

CALCUTTA.—A combined scheme for improving the outfall of the sewers of the town of Calcutta proper, for draining the suburbs and the area between the canal and the Circular-road, was commenced during 1897. Larger pumps are to be fixed at Palmer's Bridge, a high-level sewer is to be constructed which will meet a second high-level sewer intended for the suburban outfall, and the combined sewage of the town and suburbs is to be carried in a channel lined with masonry to a new outfall at Baintolla, some miles below the present outfall in the Balliaghata Canal. A main sewer is also to be constructed, which will enter from Watgunge on the Hooghly bank, and passing under Tolly's Nala by gravitation, will discharge at a station to be established near the Rifle Range on the Eastern Bengal State Railway. The suburban outfall will be precisely similar to one now working at Palmer's Bridge. There will be two pumping-stations for the suburban main sewer, one at the Budge-Budge-road and one at the outfall. The foundation-stone of the drainage works was laid by the Lieutenant-Governor, Sir Alexander Mackenzie, on the 26th November, 1896.

DOUGLAS, ISLE OF MAN.—A start in earnest was made on Friday with the new main sewer system adopted by the Douglas Town Council, after debates and opposition extending over years, the last opposition of a month ago having led to the withdrawal of the tender of a Glasgow firm for carrying out the land section of the work, at a cost of £26,000. The revised estimated cost, excluding any rise that may result from the withdrawal of the main tender, is £50,000. The section of the work now started is the new outfall, which will give a new discharge point for the sewer in the deep sea, about a quarter of a mile to the north-east of Conister, where there is nine hours' ebb-tide, which will carry the sewage clear of the bay. The present unsightly outfall is close to the landing pier. Messrs. Aird and Co., London, contractors, are carrying out this outfall section.—The Town Council considered on Tuesday the report of Messrs. Stevenson and Burstall, engineers, the authors of the improved scheme of drainage for Douglas adopted by the Council. Mr. Stevenson explained the causes that had resulted in his original estimate of £29,000 having been increased to over £49,000, and reported upon other matters connected with the scheme.—The Highways Committee recommended the Tynwald Court be applied to for further borrowing powers of £20,000, in addition to the £35,000 already sanctioned in connection with the scheme. Mr. Clucas moved an amendment that Mr. Pritchard, who had also submitted a scheme to cost £29,000, should be approached in the matter.—The amendment was lost and the recommendation carried.

PEWSEY, WILTS.—In consequence of a recent outbreak of typhoid in the district, the parish council of Pewsey and rural district council instructed Messrs. Fairbank and Son, civil engineers, of York, to inspect the district and report as to the probable cost of a water supply. A voluminous report from them was presented to the Pewsey Rural District Council on Monday. They stated that an admirable supply of pure water could be obtained from Seven Springs, and carried through the district at an estimated cost of £3,469 10s., or £2,671 10s. if some isolated portions were left out of the scheme. The estimated annual expenditure would be £340, or £283 18s. for the partial scheme. These figures did not include land or wayleaves, and were based on the assumption that all the houses in the district would be connected with the system. It was decided to defer the consideration of the report for the present.

CHIPS.

Forest Fold Baptist Chapel near Crowborough was reopened last week after reroofing and reseating, and the addition of classrooms and vestries. Mr. A. E. Allen, of Northampton (late of Crowborough), was the architect.

The two-storied workshops of Mr. A. Taylor, a builder, in Ley-street, Ilford, suddenly collapsed on Friday evening. Elgar Chatterton, a carpenter, and a man named Burton were working on the top floor at the time. In the fall Chatterton was killed, but Burton escaped uninjured. The building walls, which consisted of 9in. brickwork, were only erected two months ago.

The vacancy for a clerk in the city surveyor's office at Winchester, on the promotion of Mr. Jennings, was filled up on Thursday in last week by the council of that city. A committee had weeded out three candidates from 71, and out of this trio Mr. Arthur Longland, for eight years in the office of Messrs. Cancellor and Hill, architects and surveyors, has been elected.

On Wednesday week two inquiries were held at the town hall, Tunstall, by Mr. H. P. Boulnois, an inspector of the Local Government Board, with reference to applications of the Tunstall Urban District Council for sanction to borrow £23,000 for purposes of sewerage and sewage disposal; and £5,000 for the purchase of land for the purpose of a public park.

The Sheffield City Council have decided to negotiate for the purchase of the Sheffield Electric Light and Power Company's undertaking on the terms of £220 of Sheffield Corporation Two-and-a-Half per Cent. redeemable stock for every £100 of the sum expended by the company upon their undertaking and chargeable to capital account, provided that the amount of such capital expenditure shall not in any event exceed £112,000, any further expenditure properly made being repaid to the company with 5 per cent. interest.

The want of an independent water supply at the Zoological Gardens has been felt for many years, and recently it was decided to put down an artesian bored tube well, the results of which have been the tapping of powerful springs of pure water in the chalk at the depth of 450ft., yielding 240,000 gallons per day. The engineers are Messrs. C. Isler and Co., of Southwark.

Subscriptions are being invited among the fellows of the Society of Antiquaries of London for the purpose of placing a memorial portrait in bronze of the late Sir Wollaston Franks, their former president, in the society's rooms, in recognition of his eminent services to archæology. Mr. Charles J. Praetorius, who had for many years worked for Sir Wollaston at the British Museum, had various sketches and notes which, in his opinion, would enable him to produce a portrait, and, having modelled a life-size profile head in relief in wax, the work has been approved. The council will offer a duplicate copy of this for the acceptance of the trustees of the British Museum.

A deputation of the Worcester County Council held an inquiry at Hales Owen on Friday respecting an order directing that an isolation hospital should be established for the Stourbridge Urban Council and Hales Owen Rural District Council, application having been made asking the County Council to make arrangements for the borrowing of a sum not exceeding £10,000, for erection of the hospital. The hospital will contains 30 beds, and the total, as estimated by the architect (Mr. Eyre, of London), is £9,150.

Our Office Table.

THE inquest as to the cause of the great fire in Cripplegate was concluded on Wednesday at the Guildhall. The jury, after over four hours' deliberation, found that the fire originated on the first floor of premises in the occupation of Waller and Brown, Well-street; that it was caused by the wilful ignition of a stack of goods by some person or persons unknown; that there was no delay on the part of the Fire Brigade in arriving at the scene; that the appliances and steamers and supply of water were sufficient, but that the supply of coal to the steamers was inadequate; and that the causes of the rapid development of the fire were the style and construction of the buildings, the narrowness of the streets, the delay in summoning the Fire Brigade after the fire broke out, and the further delay of 14 minutes in getting the first engine to work. The jury offered various recommendations with respect to the reconstruction of the buildings and the improvement of the methods and appliances of the Fire Brigade. It was stated, in reply to the City solicitor, that the jury were not unanimous as to the finding that the fire had been wilfully caused.

THE First Commissioner of Works announced last year in Parliament that the Queen had approved of the Ranger's Lodge, adjoining Greenwich Park, heing let by the Commissioners of Woods as part of the Crown lands under her charge, and that her Majesty would throw into the Park, for the use of the public, fifteen acres of land hitherto annexed to the Lodge. The Queen has now further decided that the old palace at Kew shall be opened as a public museum under the same management as Kew Gardens, and the grounds belonging to the Queen's Cottage will also be utilised in connection with the Royal Gardens at Kew. Furthermore, her Majesty has directed that the State-rooms at Kensington Palace, in the central part of the building, which have been closed and unoccupied since 1760, together with Sir Christopher Wren's banqueting-room attached to the palace, shall, after restoration, be opened to the puhlic, and the Government will forthwith submit to Parliament an estimate of the cost of restoration.

IN connection with the winter meeting for teachers conducted by the College of Preceptors, Sir Joshua Fitch gave a lecture on Friday on the National Gallery and its educational uses. As Mr. Ruskin had said, this gallery was now for the purposes of the general student the most important collection of paintings in Europe. Of all the notable art galleries of the Continent, he knew none so choice as our own, none which contained so few inferior pictures, none in which the student of art would find such characteristic examples of what was best in the great schools of painting, and none in which he could trace with more exactness the history of art. In the 1,500 pictures of the national collection, classified into schools, and ranged round 22 noble rooms, a rich store lay open to the visitor, whether his purpose was simply to trace the development of art, or to study the growth of religious ideas, to observe the various costumes of different nations, the comparative treatment of landscape and of the aspects of nature, or whether it was desired to find out in how many ways national and individual characteristics have been represented by the painter. The leeturer went on to illustrate how the varions purposes indicated might best be followed out by calling attention to characteristic examples of different schools represented in the National Gallery.

THE corporation of Bootle have recently advertised asking local builders and contractors to send in tenders for the erection of a lodge at the Derby Park, from plans and specifications prepared in the borough engineer's office. The advertisement states that "persons tendering must submit their own schedule of quantities fully priced out, which must accompany the tender." The Liverpool Master Builders' Association have written to the town clerk of Bootle, pointing out the unfairness of this condition, and that it will involve all but one of those who respond in a perfectly unnecessary and fruitless expense. So far, however, the association have not succeeded in obtaining the withdrawal of the objectionable clause.

FIVE years ago the City Council of Boston, Mass., appointed a board of appeal, to which disputes arising between architects, owners, or contractors and the City Building Department are referred for settlement. The board is composed of an architect, a builder, and a lawyer. Nearly 200 cases have come before it for adjudication. The success which has attended its deliberations and conclusions can be judged by the fact that in only one or two instances have appeals been made to the courts from its findings.

THE vacant space in the decorative scheme of the ornamentation of the west front of the Doge's Palace in Venice has at last been filled up by a representation of the original statuary. This monument, which consisted of a figuro of the Doge Gritti, together with a winged lion, was destroyed during the rioting which accompanied the fall of the Venetian Republic. Two years ago the Italian Government opened a competition among native artists and offered a prize for the best reproduction of the missing monument. The prize was won, and the work has been executed by a young Venetian sculptor, Urbano Bottasso. This colossal piece of alto-relievo sculpture, executed in Istrian marble, is about 11ft. long. It represents the Lion of St. Mark with his paw resting on the open Bible; opposite him kneels the Doge Gritti, draped in the ducal mantle and holding an inscribed banderole in his hand. The work was to have been completed by February, 1899, but such was the zeal of the young sculptor that the monument was finished more than a year before the stipulated time. The week before last the alto-relievo was raised to its place and fixed on the cornice over the balcony opening in which the Doges of old used to appear before the populace at special times and seasons. The inaugural ceremony has been postponed until March 22 next, when jubilee festivities will be held in order to celebrate the Revolution which gave freedom to Venice.

IT is proposed to hold in New York in the spring an International Health Exposition of a novel kind. Besides the display of heating and ventilating apparatus, plumbing appliances, model schoolrooms and hospitals, lectures are to be given on topics related to sanitation inclu ling pathological electricity, of which Mr. Nikola Tesla is to treat; and discussions will also be arranged. Mr. Charles F. Wingate, sanitary engineer, is the supervising director, and has contrived some striking illustrations of matters of hygiene, showing, for example, a county poor-house cell of the old type, with its "mad woman" chained to the floor, side by side with a modern asylum ward; and a schoolroom of the ancient pattern in contrast with one of the present model.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. Business and Ordinary Meeting. 8 p.m.

TUESDAY.—Society of Arts. "My Recent Journey from the Nile to the Soudan," by Frederic Villiers. 4.30 p.m.

WEDNESDAY.—Society of Arts. "The Projection of Luminous Objects in Space," by Eric S. Bruce, M.A. 8 p.m.

THURSDAY.—Society of Arts. "Recreations of an Indian Official," by the Right Hon. Sir M. E. Grant-Duff, G.C.I.E. 4.30 p.m.
Society of Architects. St. James's Hall, Piccadilly, W. 8 p.m.

FRIDAY.—Architectural Association Lyric Club. Concert at Swallow-street Club, Piccadilly. 8 p.m.
Birmingham Architectural Association. "Malta," by the Rev. W. K. R. Bedford. 6.45 p.m.

The salary of Mr. J. Wilding, surveyor to the Runcorn Urban District Council, has been raised from £180 to £200 per annum, and is to be further inereased £10 per annum for two successive years.

The Coventry and Warwickshire Hospital was open to the general public for inspection on Friday, after renovation, refurnishing, &c., at a cost of nearly £1,500. The interior has been ventilated, painted, and decorated, repairs executed, several wards and rooms rearranged, and a large sum of money spent on furniture, bedsteads, and bedding. Messrs. Whiteman and Son were the painters and decorators.

At a special meeting of the Liverpool Select Vestry, held on Friday, a report of the committee appointed to consider the hospital accommodation for the sick and infirm inmates of the workhouse was submitted and approved. The proposed scheme contemplates the erection of a new building, competitive designs for which are to be asked from Mr. Edmund Kirby and Mr. E. Willink (Messrs. Willink and Thicknesse), both of Liverpool. To the architect whose plans are not selected an honorarium of fifty guineas will be paid by the vestry.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2246.
FRIDAY, JANUARY 21, 1898.

THE FINISH OF BUILDINGS.

NO master mind has ever eschewed detail. Of all great masters of sculpture and composition in the plastic arts, Michael Angelo was probably supreme in grandeur of conception and power of grouping, and no one could accuse him of over-fondness for detail, and yet he has said "Trifles make perfection, and perfection is no trifle." We may expect to find exquisite beauty and finish in the work of a mosaicist, of an enameller, or a silversmith, but it is not thought to be one of the essential qualities in building. Yet nowhere else do we find the evidences of bad workmanship and design more destructive of all repose and comfort. Unless the architect devotes his attention to details, his work suffers from a want of completeness which often robs it of those essential qualities the public most look for. On such things as well-fitted doors and windows, fastenings, drains, and sanitary appliances, the client lays great stress; they are requirements which he thinks he has a right to expect as near perfection as it is possible. Less apparent and obvious to the ordinary owner or building client are those other minutiæ of a design which place it above the production of the ordinary builder; but they are equally important if only the architect would give them the attention they deserve. To be exact in design, skilful in plan, to exhibit finesse in certain details, are qualities expected of the man who follows the profession of architect. It is not enough for him to design well, build substantially, to make his walls strong enough to bear weights and thrusts, to calculate the strength of floors and roofs: he must do more than all this if he aspires to the rank of master artist. In plan the effect of finish is important. We see it in such details as the treatment of corners, in the avoidance of sharp angles between two fronts of a building, in square-shaped rooms, in the position and arrangement of columns and pilasters, in dividing apartments, in the planning of halls and vestibules, the location of doors and windows, and in various other details. It is in these points we can at once distinguish the plan of a novice or simply practical man from that of a competent architect. With the former all is haphazard or rough;—the walls are divided at random, or there is no attempt to study plan architecturally; with the latter considerable thought is shown in aligning the walls, settling positions of piers and columns, and so arranging halls and corridors that they will contribute to the effect or the *tout ensemble* of the interior.

These who have had experience in examining competition designs must have remarked these differences. They are like those which distinguish authors—that mark the studied and epigrammatic style of prose from the slovenly and loose composition. One sees at a glance whether the author has a grasp of his subject, or is merely setting down his ideas at random. And it is the difference between culture and ignorance, between thought and mere guesswork. To take, for example, the plans sent in for the Cardiff Town Hall and Law Courts. Compare the general distribution of the blocks, entrance hall, and corridors round the courts of the town-hall block in the premiated plan; the manner the assembly-hall is approached through a spacious ante-hall; the staircase access, and the position of this hall and council-chamber on the first floor;—or take the central rates office under the assembly-hall, and its connection with the entrance-hall and lateral approaches, and then look at other arrangements. Architectural disposition and axial arrangement of blocks is even more marked in the second premiated design: the assembly-room and council chamber are *en suite* with a central reception-hall; the main staircase block is on the centre axis, and divides the two courtyards. The external angles are well broken and finished, and the corridors round the open courts have octagonal halls at the corners. As an example of architectural plan, this design holds a high place. The main rooms are balanced, and the various offices and town clerk's apartments are so grouped as to produce a well-broken exterior. How different to other plans where the chief offices are situated without reference to effect, and where an incoherent random disposition of parts are noticed!

In the interior of buildings, finish becomes a very important indication of the architect's study. The ordinary observer may not be able to distinguish between a building of the contract standard, and one that has been carefully worked out in detail; but he, nevertheless, feels the influence of skilful adaptation of plan—of well-appointed rooms and fittings, and of suitable decoration. The ordinary kind of business premises—say, a shop—is often rough and coarsely finished. The shop window internally is a compromise in which the engineer, joiner, and plasterer have each had a finger;—the walls are bare, the ceiling is intersected with cased beams, or coarse ill-designed capitals spread out on the flat plaster without any proper abacus or architrave. The partitions and fittings are of flimsy deal or mahogany framing, they go straight up to the ceiling without the slightest attempt at any finish or connection. One quality which distinguishes the work of the real artist from the incompetent is that of uniting agreeably; the crude, clumsy joint, the incoherent junction of two materials like wood and stone or plaster, or of two parts of a design, as the joining of a colonnade to the wall, or an arch upon its impost, are details which are sure to betray the architect. They are little matters—trifles which many overlook, but are really indicative of the master's hand. Even in the plainest and simplest building we can discern his care in little matters like springings of arches, impost mouldings, the details of jambs, &c., which the ordinary builder would overlook. In out-of-the-way corners, in dark passages and lobbies, in soaring vaults, his solicitude is never absent, as we observe in all old work, where the artist-craftsman had his heart in his work, and did what he thought was right, instead of what would save his own labour and his employer's pocket. So it has ever been, that the real architect thinks nothing too small for his attention; nothing escapes his care, even to the design of the moulding or the shape of a gas-bracket.

There are many things in our building interiors that are left to chance. The joinery or woodwork often offends by its very flimsy character. If it is a spandrel of a staircase, it is like thousands of others; if it is a cupboard or a door, it is one machine-made, suitable for any other building. It is specified as "so many super feet. of 1in. or 1½in. square framed or moulded," as the case may be, and this stereotyped description is sufficient in the eyes of the average architect, who looks mainly to cost, and regards all such fittings as mere builder's work. Why have we not done more in making our joinery and common framed work decorative by the use of hardwoods? In the better class of buildings in Canada plain pine is very little used for finishing; but maple, birch, cherry, ash, and red oak are employed instead.

In the superior kind of houses and buildings these coloured woods give a finish and decorative value that cannot be obtained by ordinary pine. In Canada a house can be finished in red oak as cheaply as in pine, and the doors and framing, if veneered with it, on a pine or white cedar core, are very effective and durable. Birch and cherry are also used, plain, or stained to imitate mahogany; and the latter wood is straight-grained, and makes capital doors worked from the solid or cut into veneers. For flooring, Canadian hard maple has a good surface, and is said to be better than oak, and is closer in grain. Birch is also a good flooring material, and is used largely for stair-treads, and for newels and balusters. For superior joinery, the hard and coloured woods of America and Australia have a claim. Panels in one kind, and rails and stiles in another wood, give a finished effect, which cannot be secured by the use of ordinary deal as we import it from Canada or the Russian and Swedish ports.

But our modern joiner's work suffers mainly from the machine labour and the stereotyped forms with which it is put together. It is devoid of character and finish. The same sizes and dimensions occur, the same moulding is repeated *ad nauseam*. The modern interior is often very weak and incoherent in its mouldings. We notice repeatedly such crudities as pillars and supports cut off by a flat ceiling without any adequate capital, cased beams, or plaster mouldings running into corners at all angles, cornices dying away or losing themselves against a sloped surface like a stair soffit; framed wood partitions carried up to the ceiling without any cornice or moulding to connect the two surfaces. Or if a cornice or moulding is put round, it is made, perhaps, to cover the upper rail, which gives the appearance of the mouldings having been put up afterwards.

Then there is fitness or suitability of mouldings. To select any set of mouldings or members indifferently, without reference to the room or position, is a common fault in most interiors. We see cornices of coarse profile suitable for large rooms and halls put round small studies or boudoirs, or an insignificant series of beads round the ceiling of the entrance-hall. Badly-mitred mouldings, too, are always eyesores. The true artist will be careful in all these things, trifling though they seem. He will have neat and refined members round his door-panels and architraves, where they can be seen at close quarters. His cornices will be chosen to suit the character of the room and its height, a few delicately-cut members giving zest to one or two well-chosen curves; skirtings, surbase mouldings will be especially cared for, and the sash or casement frames and transomes will have sections chosen with particular reference to the play of light and shadow. Plasterwork design is often atrociously coarse or ill adapted, simply because the architect leaves the work to the contractor.

No less in the selection of details and fittings, the greatest care will be taken to avoid the coarse or bizarre. How many buildings are spoilt by ill-designed mantelpieces and grates, about which there is that "shoppy" look which savours of the show-room or the furniture dealer and ironmonger. Although some of these are neat and correct, they have that unmistakable character about them which shows that they have not been specially designed for the purpose. They may have been copied from designs of well-known architects; but they bear the imprint of unsuitability for their assigned position and surroundings. Looking over catalogues of designs for chimneypieces, overmantels, overdoors, and cabinets, one comes upon "bits" by Norman Shaw, Col. Edis, and other well-known designers, torn away from their original context, and placed to adorn

very ordinary stock designs. When placed *in situ*, they lack those qualities of gradation and fitness that are intimately connected with the very nature of a finished building. There is a sense of coherence and continuity of design in all good architecture which can never be reached by a piecemeal way of doing things; and it is one of the elements which is remarkably absent in the average modern building of to-day, where all is done in pieces: a bit of Venice, or a bit of Bruges; a detail from here and a detail from there, or a sample from one manufacturer and a sample from another; all, perhaps, good in their way, but together unconnected and fragmentary. The ordinary ironmonger's fitting, too, is one (and not the smallest) detail which often destroys this quality of finish. It may be only a finger-plate or a door handle; but if it is too elaborate or too crude, it jars upon the sensitive eye. When will the architect begin to realise that the beauty of his design or building depends as much on finish and detail as it does on vigour of line and massing of parts?

THE SOANE AND OTHER PRIZE DRAWINGS AT THE INSTITUTE.

THE designs submitted for a Concert-Hall, the subject proposed for the Soane Medallion and £100, have failed to produce any response worthy of the problem, which required a little more skill and inventiveness in planning than the subjects usually chosen, and no prize has been awarded. The five designs submitted are commonplace enough. Not one of them has made the hall a feature; we have, indeed, the theatre type, in which the hall is made to represent an auditorium by a separate roof, and one of the authors gives us a Classic church or chapel-like exterior, with a central steeple over the entrance; but there is no effort to produce a design distinctive of a concert-hall open on two sides. "Pan" is shown by well-drawn plans of the several floors, stalls to seat 836 persons, area for 210, with entrance from ground level; balcony for 710, and first circle 725; and a gallery for 520 on third floor. The plan shows the hall of oblong shape, with circular end, and a stage contracted between curved walls of inverted form, like that of the Queen's Hall. The small room is placed along the front at end of large concert-room, and the side is occupied by the entrances and staircases, waiting-rooms, &c. A corridor goes round three sides of the hall. Staircases are provided at each corner, and the arrangement of entrances show some skill; but the author has lost sight of the opportunity. His elevations, in a style of Italian Renaissance, may represent a block of shops, and the curb roof over hall gives a heavy effect to the building, which has little that expresses the purpose.

"34° South" has a similar-shaped concert-hall with surrounding corridors. The front entrances look better arranged and more spacious. One feature in this design is a summer promenade on the flank side. The section also shows a more pleasing roof. Externally, a commonplace Classic treatment is adopted, with heavy centre frieze and attic, both adorned by sculptured relief. "Cornice" adopts also the same shape of concert-hall, the entrance and vestibule, and staircase arrangement are fairly good, and more space is allowed between the great hall and street front, and the small concert-room is also wider; but the author has mistaken our climate. His heavy and bare block of buildings, in an austere Florentine style, which represents auditorium, and the long block of buildings attached, are surely a satire on the conditions. "Lyra" departs from the rectangular-shaped concert-hall, and adopts a circular area, with a stage formed by a smaller ogival curve. The small hall forms a block behind; and in front, towards the street, which is somewhat triapsal in form, are the staircases in projecting wings, with vestibule, &c., between. The plan is ingenious, but not one that will lend itself to practical requirements. There are radiating boxes approached from ground-level round the hall. The author seats 3,000 in all, area, balcony, boxes, and gallery, and claims that the L.C.C. regulations are adopted. The design is Classic, the front entrances and rear building appear tacked on the huge circular drum of the auditorium. It has a flat domical roof, ribbed inside. "Quod erat Faciendum" is the motto of a design which represents a Classic church with tower in front. It is adorned by Corinthian columns. In plan the author adopts a plain rectangle, narrowed at the platform end by two main staircases. Two other staircases rise on each side of the main entrance vestibule. The plan is the strongest part of the design, simple and compact, with good angle staircases, a small hall in basement below the platform of large hall, with entrance from street level. The large-scale details are well drawn.

The Tite Prize subject is a design for a Villa and Ornamental Garden in England on the Italian style—a very good theme; but we cannot say that it has evoked much ability. There are nine designs. One of the simplest is "Andante"—a quietly-treated villa and garden shown by a clever bird's-eye view. There is a loggia and central hall with apartments round it. "Star" shows a too lofty villa: the centre staircase window is attenuated, and the building does not connect itself well with the garden. "Van der Neer" shows a triangular-shaped garden, but the design is commonplace. "Triangle in Circle" is wanting in breadth and dignity; the grounds are cut up into many shapes. A large ink perspective somewhat blurred is sent. "Lorenzo" shows a dignified conception of an Italian Villa, with wings and terrace arranged on the avenue side. The coloured view is well done. "Heather" is a palatial design, with the accompaniment of terraces and other adjuncts, but there is a want of breadth in the garden. "Orion," "Tiber," and "Italian Grandeur" are other designs which more or less miss the mark. The prize is awarded to J. Stevens Lee, and a medal of merit and 10 guineas is awarded to Thos. A. Pole.

A more appropriate exercise for candidates in design and construction has been afforded for the Grissell Gold Medal. "Design for a Small Country Church" of timber has brought out some ingenuity. One of the best designs, quietly and appropriately handled, is "Doan Tu Nomi." It is of stud-work and weather boarding, with cement rough-cast panels between aisle windows. The roof in one span continues without break from end to end, and there is a low tower with shingle spire at west end. The plan is simple, with a row of pillars along the inner side of passage aisles. In a more elaborate style is "Stave Kircke," in which the plan has transepts. Some good detail drawing is shown. "Emce" is original and clever as a piece of construction, though the design is more suitable for a preaching house than a church. A spacious square hall is roofed with diagonal principals, which are externally strutted or buttressed at the angles. The plan is too complex in its entrances. If the student's initials are "M. C.," or even "C. M.," the device selected is hardly a fair one, as it would give any member of the council interested in the competitor a clue to the authorship of the design. "T." shows cleverness in the drawing; but the external design is rather too much after the stone type. "Simplex" has a suitable treatment: the plan is simple, and there is a quiet picturesqueness about the west end louvred turret. Wooden buttresses are shown. "Thistle" is pretty and picturesque, as shown by an artistic washed sketch of the west end; but the design is not suitable. "Tudor Rose" is too elaborate. The award is made to Mr. Harbottle Reed, and a medal of merit to Mr. W. Stanley Bates.

The drawings, on the whole, are creditable. The Pugin Studentship is represented by four designs by Jas. B. Fulton, Benj. Bower, Charles de Gruchy (who wins the studentship), and Ramsay Traquair. The drawings by the latter of York Minster, Skelton Church, New and Magdalen Colleges are careful, and sympathetically rendered. Benj. Bower's drawings and sketches of Wells Cathedral, the celebrated staircase to Chapter-house, and of St. Mary Magdalen, Newark, and the measured drawings of the Woolstaplers' House, Chipping Camden, are carefully executed, for which a medal of merit is awarded. C. de Gruchy sends several drawings of interest of a Chantry Tomb in St. Alban's Cathedral; St. Augustine's, Hedon; The Chevet, Church of St. Malo, Dinan; drawings of north aisle of choir, St. Mary, Beverley, &c. In the large meeting-room we notice some capital sketches by Travelling Students, 1897, of Lacock Abbey, S. Wraxall Manor—a clear sketch of porch taken from open casement of Montacute House, besides two effective drawings of a church roof and a screen. The coloured sketches of J. A. R. Inglis (Soane Medallist), the work of W. Haywood (Pugin student), A. E. Henderson, (Owen Jones student), are of interest. The Institute Silver Medal drawings and details, executed by "Clare," of Clare College, Cambridge, and the measured drawings of Charterhouse, by "Labor Omnia Vincit," and of Prior Crunden's Priory, Ely, by "Dum Spiro Spero" are meritorious. The prize is given to Thomas Tyrwhitt, and medal of merit to Cyril W. Smith. The Owen Jones Studentship has been contested by only two competitors, F. Lishman and R. S. Cockrill. Some very free and able sketches of the coloured tile panels in Lord Leighton's house. The "Arab Hall," and some elaborate coloured rood screens are exhibited.

ARCHITECTURAL ASSOCIATION.

THE sixth ordinary meeting of the Association was held on Friday evening, the President, Mr. Hampden W. Pratt, F.R.I.B.A., in the chair. Five nominations for membership having been read, Mr. T. G. Chambers was elected as a member. The President announced that the Elementary Water-Colour Class would start on Jan. 28, the instructor being Mr. Percy Buckman, and that Mr. Max Clarke would begin his lectures on "Ventilating, Lighting, and Heating," Division II., on January 31st.

COMPOSITION IN REGARD TO PUBLIC BUILDINGS.

Mr. FRANK T. BAGGALLAY, F.R.I.B.A., past-president, read a paper on this subject, illustrated by numerous perspectives—both lithographs and photographs—of important edifices at home and abroad, showing the grouping and massing. He said he proposed to consider the principles that should govern the composing of the various parts of a building into a pleasing and harmonious whole. The composition of the completed buildings, Mr. Baggallay continued, is really the true function of the architect. In a properly organised system, the details and ornamentation would be left to the various trained craftsmen, who could, and would, be trusted to work in harmony with their chief and with each other. But ours is a disorganised system, under which no harmony can be attained unless the architect himself composes or (as we say) designs the details also, or has them efficiently copied from others which he can choose. The latter alternative has come to be universally condemned, and properly so. But the condemnation has been so noisy, and the attention it has attracted has been so great, that detail still continues to hold the absurdly prominent position it attained when all architecture was judged by the correctness with which the details were copied. In connection with any other matter, the admission that anything is a detail is sufficient to relegate it to at least the

second place in our consideration; but in connection with architecture it is often the only thing that is even noticed by the critic. Our only historian because, from the Renaissance up to his time architects generally borrowed a number of ornamental features and most of their detail from ancient buildings, proceeds to heap contempt upon all modern architecture as mere copyism, and goes so far as to tell us that true architecture "expired" at the Renaissance. Few and scarce have been the writers who gave a thought to such things as light and shade, grouping, proportion, scale, character and expression—except so far as the ornamental features were affected—who were able to lay aside the microscope and the dissecting knife and study the lines and pose of the model. The fact is, those critics of architecture who have succeeded in being heard have too often been men of literary and general, instead of architectural, culture, men to whom the ornamental part was the more obvious, and more easily understood. On the ornamental details their attention has been naturally fixed, and to such an extent that, for a time, they persuaded even architects that architecture was a matter of columns and cornices, or of window tracery and mouldings, or of something vague to be invented to take the place of these things. Mr. Fergusson himself was in no sense an architect, though a picture gallery is said to have been erected from his design, and he looked at architecture from the outside only, and, with all his careful comparison of photographs and book illustrations, never seems to have succeeded in seeing anything but a number of different systems of ornamentation which he could number and ticket and criticise for the astonishment of the public and the confusion of students. It is said that originally his æsthetic sensibilities were not deficient; but if that is so, he had certainly succeeded before he wrote his history of modern architecture in choking them with philosophy and burying them under a mountain of statistics. Yet even Mr. Fergusson might have avoided, if he had not been blinded by a complication of preconceived opinion and far-fetched theories, the gigantic mistake upon which he founded his indictment of modern architecture—the mistake of supposing that decorative features first began at the Renaissance to be imitated from older buildings. Had it been true, it would have been no proper foundation for a sweeping condemnation of modern architecture. But it is not true; it is so far from true that in every age there has been far more imitation than original design in architectural ornaments. The Egyptians, when they wanted columns and capitals and cornices for their temples, did not invent them, but copied in limestone and granite the bundles of reeds and the accidental forms of their earlier mud structures, and continued to copy them with but slight modifications to the end. The Doric temples were absurdly exact copies in marble of the more ancient wooden ones, even to the nail-heads. The details of the Ionic order were borrowed from Asia Minor, and some say the Corinthian also. The Hellenic Greeks, beyond adding a degree of finish due to their greater mechanical skill, never got very far from their originals. The Romans borrowed Greek details by the bunch, and in most cases without any alteration (except that they struck their curves instead of drawing them by hand), and applied them in their own way to their own uses, precisely as the Renaissance architects afterwards applied Roman details; and the Romanesque was but Roman work badly copied. The variations that were developed in the details of the Pointed styles of Western Europe in the three or four centuries through which they lasted were, it is true, considerable; but even they were developed very gradually, and under exceptional circumstances. It is very doubtful, too, if the successive changes were made consciously. Imitation is inevitable as regards architectural forms; and, moreover, it is the only road to improvement. It is not in the power of the greatest genius that ever lived to invent any great number of entirely original ones that will at the same time be acceptable. Those who have been least unsuccessful in the attempt have only succeeded in being absurd, while of the rest the less said the better. New forms must grow gradually, and will inevitably do so if we do not persist in harking back, or in trying to make fresh starts; and if we are not too vain to imitate where we cannot improve, nor too lazy to improve if we can. We need not copy; but we shall never get on at all if each man tries to invent a brand-new style of his own. On the other hand, neither shall we get on if we condemn a fresh variation merely because it clashes with our preconceived notions. What we ask is—Is the change an improvement, or is its freshness its only justification? and if so, is the justification sufficient, or has something more important been lost in the shape of actual beauty or significance? In this matter a distinction may be drawn between details that are purely ornamental additions to the general composition, and those which have a functional character, either constructive or as emphasising any line or form in the composition; any change in these seems to demand some greater justification than its novelty. After all, the time and energy expended by architects in trying to freshen up the elements which go to make up their compositions seems as if it might be rather thrown away when we think that painters and sculptors have to use the same elements that their predecessors have been welding into works of art since the beginning of time. Should anyone ask, ironically or otherwise, how this heterodox theory is to be carried into practice, it must be confessed that the best of answers is very unlikely to be satisfactory. If these things could be done by rule, there would be no art in doing them, and they would cease to interest anyone. The most that can be done is to call attention to certain matters that seem to have led to success in particular instances, and therefore, presumably, may do so again.

THE THREE DIMENSIONS.

One of the first things to remember—and, considering the many temptations to forget it, perhaps the most important, however elementary—is that a building is not a flat thing, but an object of three dimensions, having depth as well as breadth and height: and that the best results cannot be obtained unless this is made obvious to the spectator. A comparison of the Church of the Salute at Venice with the Grimani Palace, or of Visconti's buildings of the Louvre with the Palace of Versailles, or of the Horse Guards building with Inigo Jones's Banqueting House, may indicate our meaning. All these buildings are supposed to be excellent works of art, although they come under Mr. Fergusson's description of "modern" architecture; but while the church in Venice, the Louvre in Paris, and the Horse Guards in London, look like complete buildings, the others, so far as appearances go, might be only ornamental walls. Two—the Salute and the Horse Guards—seem unsurpassed as examples of architectural modelling. The Louvre owes nothing to its details, which are, in fact, distressingly dreadful; but, like the other two, it shows its depth. It does so by means of the projecting arcade, and also (and more especially) by the roofs of the pavilions. The exhibition of the depth, or third dimension, by merely exposing the return wall, is useless. The two walls still appear to be merely walls, as may be seen by referring to the Banqueting House and Sir Gilbert Scott's Government Offices. What is wanted to suggest solidity is something showing over and beyond the walls;—in the Salute it is the dome, in the Louvre the pavilion roofs, and in the Horse Guards the charming little turret that Fergusson sneers at. Most Mediæval churches and public buildings—Continental ones, at any rate—depend mostly on their big roofs for the purpose, which they fulfilled in a simple, natural, and adequate manner: and most modern French buildings, and a few English ones, follow their lead. But here, in England, even in Mediæval times, notwithstanding there were the roofs, we liked to have also some solid structure rising from the middle of the composition, and advertising the solidity of the edifice by its substantial appearance. And we have continued to prefer the expedient, where we have adopted any at all, to an exhibition of the roof, possibly from an undeveloped feeling that all roofs look unsubstantial. At the Horse Guards, solidity is partly obtained by another expedient—more common because more easily applicable in many cases—namely, by pavilions rising a story higher than the rest, and so showing their depth; but it is the turret that pulls the whole together and makes one mass of it. In these days, large public buildings generally take the form of ranges of apartments surrounding one or more courtyards, and so far as the periphery of actual building is concerned, solidity is sometimes, though not often, given by higher pavilions. But it is now rare to find in England any attempt made to bring the whole together into one by a great feature rising behind the external range. In a vast number of cases it might be done simply by placing the eternally recurring tower, that we put in the middle of our main front or stick on to a corner, within the courtyard, or at any rate well back from the outside walls. Of course, the tower, as a tower, would lose; at any rate, its aggressiveness would be suppressed; but that is just what is often wanted for the sake of the modelling and unity of the composition. Wherever the tower or other dominating feature of the composition is placed, its proportions, as seen from different points of view, might well receive more careful consideration than they often seem to get. If a tower is used, the main idea seems usually merely to run it up to an enormous height and give it, as nearly as possible, the proportions of a factory chimney. There is frequently the same tendency to excessive height in the drum of a dome, while the flat square domes or roofs used in France and Germany are generally too low. Both the mass and proportions of the main feature, whatever it is, should be regulated by those of the group to which it belongs; a low, straggling building wants a high and narrow tower; a more concentrated composition, something broader and lower in proportion. If the area or plan of the feature has to be small for the edifice, it must be carried up high, or it will appear mean; if the opposite is the case, it can only be subordinated to the whole by keeping it low; if it is made lofty it overwhelms the rest, which must then be itself treated as subordinate. To return to the question of the position of such a feature as a tower, balance requires that it should be somewhere near the centre of the composition. It is inevitably, and is meant to be, the chief object that attracts the eye, and if it is anywhere near the outside, still worse if it is at a corner, the group must be ill-balanced from most points of view. It is doubtful if the position should be the exact centre. The best painters and sculptors, though generally careful to put the chief point of interest near the middle of the composition and to preserve a general balance between the opposite sides, always avoid the formality of a strict symmetry. There is something, however, to be said for the view that architects may properly do otherwise, especially in public works; and that such buildings should be symmetrically designed, at any rate with reference to one main axis, the principal feature being upon that axis and not far from the centre of it. The formality which other artists avoid is really necessary to give that air of dignity and distinction to a great building which its character demands. It indicates organisation and order and balanced construction. If we pass in review a few of those works which, by common consent, are the greatest productions of our art, we find that it is easy to note and appreciate the simple majesty of the Parthenon, the spaciousness of the Pantheon, the soaring vastness of Sta. Sophia, the richness of St. Mark's, the airy splendours of the great Gothic cathedrals, and the exquisite lines of St. Paul's; but we cannot find any general arrangement common to all of them, except their symmetry with reference to a main axis, and are forced to the conclusion that though many varying systems may be productive of the grandest results in skilful hands, yet symmetry is necessary to all of them. On the other hand, it is noticeable that very few buildings of the first order are symmetrical with reference to more than one axis, and that there is a certain tameness when it goes beyond that; carried to excess, symmetry may easily take all the life and vigour out of a composition. For the sake of unity and concentration the main tower or other principal feature should be single, and not duplicated or further multiplied. If it is necessary to have more than one tower, for instance, or even broken-up roofs, still, some one thing should be large enough, and more especially high enough, to dominate the rest; and in such cases it is more than ever necessary to put it well in the middle. When seen in perspective,

THE ANGLES OF A BUILDING

are as much the ends of the group as they are in elevation, though not the same angles, and some feature, or, at any rate, different treatment, is necessary there to mark the definite termination and completion of the composition; without something of the kind a reason for stopping at that particular point seems to be wanting. In any extensive building, rectangular in plan, the sides of which recede from the spectator when seen in perspective, giving

long lines running away down towards the horizon, something more than a mere angle; pier or quoins will generally be wanted at the ends of the composition, or a little within them, to break such lines, and, as it were, lift them up. It is better for the general contour of the group if such features are not at, but within, the actual ends. They may even be the middle features of short fronts. The great thing is that they must break the lines; they must rise above the skyline, and their vertical lines ought to be higher than the cornice or finish of the walls generally, although the cornice may, and indeed should, as a rule, break round them. The necessity for carrying up the vertical lines of these features is often overlooked with unfortunate results, as in the case of the buildings of the Louvre before referred to. Great care should, however, be taken that these secondary features do not compete with the main central one for attention. They should be smaller in every way, but especially they should be lower; and to get the best result they should be entirely different in design. The hen-and-chickens arrangement of a great dome and several little domes, or a great tower or spire and smaller echoes of it, is always less satisfactory than a group in which there is no suspicion of an attempt on the part of the secondary features to ape the principal one. There should also be a very restricted limit to the number of these secondary features; neither the same design nor even the same general outline and proportions must be repeated too often: and never repeated in features which occupy different situations in the composition. Such repetition leads to both redundancy and the most poverty-stricken kind of monotomy. In buildings like the Gothic cathedrals, in which the horizontal lines radiate from the centre, and consequently, when seen in perspective, run up instead of down, no secondary features to break them are required. A little turret or group of buttresses to stop the composition seems sufficient. It may appear a rather daring thing to say, but the western towers of cathedrals in most cases seem a mistake. They are generally far too large in scale, and too similar in form to the main central tower, to group well with it: and they are at one extremity of the composition, in most views balancing, if one can call it balancing, nothing at the other end; which, indeed, where there is an apse, is sloping downwards in a very undignified way. The Romanesque architect, in this respect, managed better, generally getting towers or turrets at both ends. Perhaps, where there is an unusually long nave, something smaller than towers, not placed at the extreme end, but a little way from it—say, another transept—would have been an advantage: but Salisbury has not anything, and, even apart from its size, it is a far more pleasing composition than Lichfield, with its three spires. Western towers, with nothing large enough over the crossing to hold its own, are a gigantic mistake, of which Cologne Cathedral is the typical example.

THE BREAKING UP OF SKY-LINES

is a thing that has often been recommended; but while it is generally necessary to break a long one upwards or stop it at the end, to break it by a drop or cut through it is a thing to be avoided at almost any cost, and to do so for choice is to make a very serious mistake. It is still worse to break through a main cornice. These lines are perhaps the most important in a composition. They are wanted to hold it together, and give it unity and strength, and to cut through them is like cutting the cords of a bundle of sticks, and allowing it to fall to pieces. After solidity and unity, one of the most important things to be seen to is character, and one of the chief elements in character is

SCALE.

Small parts tend to delicacy and pettiness, large ones to strength and grandeur. Small parts are supposed to make a building look large, and large parts to make it look small; but the influence of scale in that respect is probably greatly overrated; a man near, or any object the size of which is familiar, trees and surrounding buildings, and so on, give to the eye a just impression of scale which no exaggeration, in either direction, of the details of the building itself can do very much to remove. The attempt to give an impression of size by this means is supposed to be not only legitimate, but praiseworthy. But it is, after all, a species of deception, and one which really defeats its own ends; for there can be no object in trying to exaggerate the size of a building, unless it be to produce an impression of grandeur; but small details necessarily suggest delicacy and thinness—qualities absolutely opposed to grandeur. If the smallness be more than is reasonable, or, rather, more than is customary, the structure even begins to look like the model of a larger one. It is, of course, possible to go too far, and to make details so large that they become coarse and vulgar. But for a public building, or any great architectural work, it is essential to its character that the parts shall be large enough to look exceptionally substantial, to suggest big piers, thick walls, a general massiveness, and, above all, largeness of idea and an avoidance of pettiness. Substantial construction may be suggested without the use of ornamental details by setting the door and window-frames back and showing deep reveals, by the use of large material, by plenty of unbroken wall, and in other ways; but the simplest treatment calls for a little detail of some sort, the scale of which will help to give character, and in public buildings should be large. Particularly the projection or relief should be adequate, since it is that which most suggests the existence of plenty of thickness. Thus attached columns, besides being more delicately shaded, and therefore more beautiful, are also a far finer treatment than pilasters. Unfortunately they are also more expensive and more difficult to deal with, but that is by the way. Whatever the scale is, it is most important to use it consistently. One used to be told that you must have two scales side by side, but that is a mistake: there is no harm in having a nave arcade of large arches and a wall or screen arcade of small ones, nor in using a large order on the walls and a small one for window dressing. What is inexcusable and destructive of harmony is to put a cornice consisting of a number of small mouldings on the top of a pier, the cap of which is composed of a few large ones, or to give the nave and screen arcades the same sized mouldings, or, to take a commoner case, put to the same building a block cornice composed of small mouldings and a plinth of one big one. This is a matter which is not infrequently overlooked in the sculpture and carved ornaments of a building, even when there is no fault to find with the architectural details. Sculpture, and what is called architectural carving, are generally used to emphasise certain points, or, as it were, to punctuate the composition; and to a certain extent also to cover up awkward lines or spaces, which by management of their own lines they can be made to correct or obliterate. But although these uses are legitimate enough, it is most effective in broad masses such as deep bands and friezes, and particularly in the half lights under cornices, pediments, and the like; perhaps because it breaks up and gives richness to the shadows. Attempts to deal definitely with the

LIGHT AND SHADE ON THE EXTERIOR OF A BUILDING

meet with little encouragement from the weather in our climate, where, during so much of the time, it is difficult to see the difference between the two, unless the shadow is a very black one; and an architect who depended on them alone would only get his effects for a few hours occasionally. It is, however, a very important subject, and always worth considering. The broader lights and shadows of the masses and breaks in a composition, of course, change in shape as the earth moves round the sun; but a consideration of the fine effect produced by a broad shadow might often influence the depth of a break if the designer thought about it; and if he remembered how beautifully a round surface curves and softens the edges of a shadow cast upon it, he might sometimes be influenced in favour of such a form. It is also true that a lighted surface may be thrown almost entirely into shadow by breaking up the surface, provided the aspect be favourable. But it is in the incidental shadows that most may be done. Incidental shadows arise from making recesses in lighted surfaces, or in contriving projections from them. Neither light nor shade, although they should be in broad masses, want to be in quite flat, unbroken ones. If there are a few windows or holes to give black spots, and a few projections—such as mouldings or balconies—in the lighted surface, and different depths of darkness in the shadow, both are richer and appear stronger. The finest broken shadows are those formed by a covered colonnade with a wall behind, giving delicately graduated shadows on the columns and a deep one on the wall: such a feature also suggests solidity.

IN INTERIORS THE MANAGEMENT OF LIGHT

is one of the most important means of obtaining good effect. Instead of trying, as we too often do, to merely get an equal flood of light everywhere, that is precisely what we should try to avoid. While light enough is one thing, an all-pervading glare is quite another. A contrast of light and shade is as necessary inside as outside, and in this country we can do far more with it inside. A corridor equally lighted throughout its length is perfectly uninteresting, though the light be from the side or the top; but one which is crossed by a broad patch of light that increases the obscurity of the comparative shadow beyond is interesting at once. A definite light from one side or from above casts shadows and gives form to objects, whereas an equal light all round casts no shadows, and destroys form and distance. The worst light is one directly in the spectator's eye; not only is it physically annoying, but it shows everything in equal shadow. The best light is often said to be a top light, which throws all the upper part of the apartment into shade, and lights the floor and lower part of the walls. But light high up in the walls which lights the ceiling and leaves the lower parts in comparative shadow is even better. In internal effects generally we are at the present time, in our public buildings, immeasurably behind the architects of other ages, and even of our contemporaries in other countries. Any attempt, for instance, at a really fine staircase, or at a spacious hall, almost always frightens people if it is made. And it is seldom made because ninety-nine out of a hundred of our public buildings are the result of competitions in which architects are asked for an amount of accommodation which can only just be provided, if it can be provided at all, for the cost; and although it is sometimes stated that corridors and staircases are to be ample, every one knows that what would be considered the minimum in France would be regarded as sinful waste in England.

Mr. J. M. Brydon proposed a vote of thanks to the lecturer for his suggestive treatment of a subject which ought to engage the attention of all young architects, for composition undoubtedly lay at the root of all architecture. While Mr. Baggallay had referred to the main features in composition which rendered a building great or the reverse, one or two points might well have been more emphasised. One of these was the influence of material on composition. Material had always exercised enormous influence on the forms and features of buildings. It was more easy to obtain largeness of mass and refinement of colour when using a noble material, such as marble, than when the designer was restricted to brick, or that latter-day abomination, terracotta. Immediately stone was substituted for wood in Greek temples the whole construction was ennobled, and assumed the character of masonry. He held strongly that architects must revert to the use of grand materials, such as stone or marble, for their public buildings, or they would fail in composition. It was nearly impossible to get a great building out of terracotta, which was not constructive, but merely decorative in character; if used at all, it should be employed as in the Science Schools at South Kensington, inclosed in broad masses of brickwork. Another effective example of its employment was the Great Hospital at Milan. Another important point in composition was the question of the site which the building was to occupy. An admirable instance of the utilisation of the brow of a steep hill was afforded by the Palais de Justice at Brussels, and the Church of the Salute at Venice showed what could be done with a low, waterside position. He differed from the lecturer, and thought the lines of a tower should be brought to the ground; or, if not, should obviously grow out of the meeting lines of the building, as was the case with the grand dome of St. Paul's. Unless a building or tower had good proportion of parts, no amount of fussy detail would redeem it from being commonplace. In his condemnation of the hen-and-chickens treatment, Mr. Baggallay had happily emphasised the need for making some one feature dominant. Another common cause of failure in modern work was the want of reticence. He would say to young men, Do not put all your goods in the front window. If your building shows self-restraint, you may hereafter

be intrusted with a second commission. Inigo Jones was a master of proportion, and had a contempt for mere prettiness, as he said architecture should be solid, proportioned, masculine, and unaffected. One of the finest examples of architectural composition, and one which had not been referred to or illustrated, was begun by Inigo Jones and completed by Wren—he alluded to Greenwich Hospital.

Mr. H. H. STATHAM, in seconding the vote of thanks, said he was glad to hear the lecturer run a tilt at the notion that architecture was dead at the time of the Renaissance, for that dictum was a complete mistake. Although it took some details, the Renaissance did not borrow its design from the antique. It was rather amusing to hear Fergusson put through the mangle, although, so sure was he that everything he wrote was true, he would not have cared, had he been alive, to hear the attacks. Fergusson found too many best buildings in the world, and often flatly contradicted himself on successive pages; but Mr. Baggallay had done him some injustice in asserting that he gave his sole attention to detail. Fergusson, indeed, grasped the idea that the plan was the scheme of the whole building. Composition was the greatest test of a building; but it was also true that the refinement of the detail gave a means of judging of the attention a man had given to his art. With Mr. Brydon, he differed from the author in his views of the treatment of towers. He thought the tower should go down to the ground, and surely, where such a feature was placed at the angle of two streets, it ought to accentuate that angle. Mr. Baggalley had spoken very harshly of the details of modern French buildings, and they certainly lacked refinement, but he wished we could get sculpture of equal merit. The reason for the absence of a central feature to French and German cathedrals was the too great ambition of the designers; they carried the walls of these churches to such a height that they dare not add a central tower of sufficient dignity and scale. He did not think it was always well to carry a cornice all round a building. As for the iron and glass pavilion over the middle of the Parliament House at Berlin, he regarded it as the worst central feature on any modern building.

Mr. ARTHUR T. BOLTON said the meagre character of the pavilion just referred to was the fault not of the architect but of the committee, who insisted on reducing its height by 15ft. The Victoria and Clock Towers at the Westminster Palace were afterthoughts of Sir Charles Barry, and, as finally carried out, greatly improved the composition as a whole, although placed at the extremities of the site. The coarseness of modern French details was due partly to the character of the stone used, and partly to the fact that it was worked on the building. A central feature was absolutely essential for success in composition; some very fine buildings, including the Pitti Palace at Florence, had a very grand effect, although each consisting only of three horizontal masses, a central block, and two wings. Mr. Brydon had been hard on the effect of brickwork; but it was not always given a fair chance. The material was well employed in some Spanish palaces and Roman works. Brick should be used in broad masses, and the details from masonry should be transferred to this material. The Horse Guards building was designed by Kent; but the central turret was added after his death by Ripley, and this perhaps accounted for its crudeness of detail.

Mr. A. S. FLOWER thought in nearly all cases Mr. Baggallay had hit the nail on the head, and he agreed with him in thinking that in most cases the lower part of a tower could be smudged out of a composition with very good effect. Salisbury Cathedral was an eminently satisfactory example of grouping with a central tower and spire growing out of the intersection of the main lines, and, speaking for himself, he did not care for the treatment of the Victoria Tower at Westminster. Lincoln Cathedral was spoiled by the loss of its former central spire, which pulled the composition together. Most of the recent designs for towers shown in the building journals showed a preponderance of buttresses and a lack of a central dominant feature.

Mr. B. FLIGHT FLETCHER remarked that Burke, in his well-known "Essay on the Sublime and the Beautiful," put in an admirable way many points of composition in architecture. He would suggest that a class might, with much profit, be organised for studying this subject, which was now too often left by the designer to chance.

The PRESIDENT, in summing up, observed that site was undoubtedly the first consideration in tower architecture. He then put the vote of thanks, which was carried by acclamation.

Mr. BAGGALLAY, in acknowledging it, said he must confess to have overlooked the fact, brought out by Mr. Brydon, that material exercises a great influence on the general composition through its details. A tower, as a feature, would, of course, lose if put behind other buildings: but he adhered to the opinion that by adopting such a position the composition of the group as a whole would gain. He had not quoted Greenwich Hospital, as it ran contrary to his theory that a central feature was needed to give point to the scheme: it was a fine composition, but it took an Inigo Jones and a Christopher Wren to evolve so magnificent an exception to the rule. One of the failings of the present day was to think too much of the architect, and another was to judge of the success of a building by the refinement shown in the detail. He had exaggerated his case, he would admit: but he held greater refinement of detail could be obtained if the designer utilised old forms than if he aimed at employing original ones. If he chose his details thoughtfully, it would not matter if they were copied from old work. One of the difficulties in teaching composition in class was that there were almost as many exceptions as rules. He agreed with Mr. Brydon that one could not have a really grand building carried out in so small a material as brick.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AWARDS OF PRIZES AND STUDENTSHIPS.

AT the close of the business meeting of the Institute held on Monday evening, Mr. Edward Gruning, vice-president, in the chair, the awards of prizes and studentships were awarded as follows:—

Essay Prize: Institute Silver Medal and 25 guineas. Subject of essay, "Review of English Architecture of the Nineteenth Century." Not awarded. One essay only submitted.

Measured Drawings: Institute Silver Medal and 10 guineas, Thomas Tyrwhitt, 36, St. George's-square, S.W.; Medal of merit, Cyril Wootner Smith, 34, Woodberry-grove, Finsbury Park, N. Six sets of drawings sent in, the subjects being "Ancient Buildings in the United Kingdom."

Soane Medallion for design and £100 for Continental travel and study of ancient buildings abroad. Subject, a Concert Hall. Not awarded. Five designs sent in.

Pugin Travelling Studentship: Silver Medal and £40 for travel in Great Britain and Ireland and study of Mediæval buildings. Studentship, Charles de Gruchy, 13, Melody-road, Wandsworth. Medal of merit, Benjamin Bower, 168, Vauxhall-road, Birmingham. Four sets of drawings.

Owen Jones Travelling Studentship and £50, for the study of ornament and colour decoration. Not awarded. Two sets of designs.

Tite Prize for Designs according to the Principles of Palladio, Vignola, Wren, or Chambers, and £30 for travel and study in Italy, John Stevens Lee, 78, Comeragh-road, West Kensington, W. Medal of merit and ten guineas, Thomas A. Pole, 35, Bernard-street, Russell-square, W.C. Nine designs submitted.

Grissell Gold Medal and Ten Guineas for design and construction. Subject, a Small Country Church. Harbottle Reed, 12, Castle-street, Exeter. Medal of merit, William Stanley Bates, 59, Clarence-road, Clapton, N.E. Twelve designs submitted.

Aldwinckle Studentship and £50 for travel and study in Spain, James B. Fulton, 34, Mecklenburgh-square, W.C.

Arthur Cates Prizes for testimonies of study prepared by students for the final examinations. June, Percy Morris, 67, Ellescombe-road, Old Charlton, Kent. November, Laurence Hobson, Hale-road, Liscard, Cheshire.

It was announced that at the meeting to be held on Monday next, the 24th inst., a criticism on the awards will be read by Mr. Ernest George, and an address to the students will be delivered by the president, Professor George Aitchison, R.A., who will also distribute the prizes.

THE WORK OF CHARLES KEENE.

[WITH ILLUSTRATIONS—SEE PAGE 92.]

MR. JOSEPH PENNELL, in writing the comments on the drawings of Charles Keene, which Mr. T. Fisher Unwin has reproduced in the magnificent volume just published by him under the above title, unhesitatingly asserts that "Charles Keene is, with the possible exception of Hogarth, the greatest artist England has produced," and "that his work is uniformly of supreme merit, that it is all worth the acquisition, the consideration, and the loving study of the collector, the writer, and the artist." Those who have combined forces in collating this exquisite collection of sketches and studies which constitute the value of the book thus produced, have unreservedly assisted in rendering possible so charming an addition to the national art treasures of the 19th century. There can be no doubt about that, though among the sincere admirers of Keene there are many who may scarcely be prepared to entirely endorse Mr. Pennell's eulogium above quoted. There can be indeed little gained, when treating on the work of so thorough a master of the pen and pencil as Charles Keene, by adopting such a superlative style of writing. This method of expression seems to have become chronic rather with Mr. Pennell. We willingly recognise, however, the aptness and sententiousness of his critical and descriptive remarks which accompany the specimens here so thoroughly well brought before us, and the introductory chapter which Mr. Pennell has indited with so graphic a touch and spirit, embodies much concerning Keene both new and *à propos*. That the artistic world did not adequately recognise Keene no one can call in question: but then all the chief socially important artistic societies in this country are overwhelmed with the influence of painters who seldom know or care for anything but oil- and water-colour painting, which, to them, is the limit of "Fine Art." Sculpture, architecture, black-and-white, as well as the applied arts, occupy but a very minor place in their ideal; and, moreover, it is of the highest consequence that the worker in any of these directions should pay tribute, above all things, to the shrine of cult and fashion. He must appear in public and pose: he should entertain and flatter the influential, taking the world, in fact, as he finds it. After all, too, there must be a recognition on both sides, and while we yield to no one in our admiration for the work of Charles Keene, it is but fair to acknowledge that side of his character which appears so evident in the pages of his "Life and Letters," by Mr. G. S. Layard—a book quite as appreciative of Charles Keene as that now before us. Keene accumulated a considerable amount of money, and his mode of life was not calculated to attract popularity excepting among the very few who knew him personally. We cannot, however, agree with Mr. Pennell when he says, "To the many, *Punch* meant Leech or Doyle or Du Maurier; only the few looked to it for Keene. The little that has been written about him proves the little that was thought of him. His drawings, as a rule, were received in silence or with a silly guffaw." We doubt the truth of this, and we think it very likely that Keene was far happier indulging in his eccentric isolation with his army of old clays, his curious collection of bagpipes, his economical solitude, cooking his own stews, and catering for himself, than he would ever have been as the lion of society, the member of any academy, or the hero of the hour. His work will live, and in that assurance, Keene must have found the greatest delight of his life, and to the capable worker in any art that, when all is said and done, remains the only aim for worthy ambition. Keene has left a legacy to the world, which will survive when most now so much in evidence has passed away: his wit was so human, his sense of humour so permanent, and his art of expression so real. Keene used to say that a man who could draw anything could draw everything. And we have only to turn over a collection of his drawings, such as those which we are enabled to enjoy in this admirably-produced volume, to realise how true this was of himself. Take his portraits, his studies of costumes or figures, his character sketches, the landscapes or bits from the sea-shore, his drawings of old buildings or notes of details. There is a sense of movement and expression in his figures, "he felt everything he drew," and possessed a delightfully humorous quality which was not fantastic—always kindly and genial, seldom whimsical, never vulgar, and always true to nature. The idea of the book which Mr. Fisher Unwin has issued was developed from the collection of original studies and preliminary sketches by Keene, which the publisher is fortunate enough to own, and so in the volume in many cases Mr. Pennell has been enabled to place the published illustrations side by side with the original designs. This is extremely interesting,

and to make the result more complete, the actual colour of the paper on which many of these preliminary studies were made has been reproduced in fac-simile. The photogravure of Keene's etching of an Old Timber House at Witley, where Keene had Tighbourne Cottage, rented of Birket Foster. "It is a very bosky-copsey country, very picturesque and English," he says. The plate forms the frontispiece, is one of the best things in the volume, and those which will probably attract our readers in a special way are the other architectural sketches, which deservedly hold a place of honour in the folio, for few who have only seen Keene's illustrations in *Punch* had any idea that he had such a love for old buildings. By the courtesy of Mr. Fisher Unwin, we print to-day three of these. The first represents Hever Castle, Kent, a study in ink on blue paper. The architecture is perfectly understood and expressed. Each line, too, in the foreground tells a story. The old church, also drawn in the original on blue paper, is unnamed. Possibly some of our readers may identify it. This would be an advantage. It might be in Kent. "Note the way" in which Keene "concentrates his blacks" (in this sketch), "and so gets brilliancy in the lights; the study he has given each pane in the windows, and the delightful trees in the distance." The third drawing is supposed to represent a piece of old Turnham Green. Another suggestion made is that it may be from Kew Green; but it is just possible the sketch was made at Hampton Court, facing the Common. It makes little difference. The drawing is excellent. It is drawn in ink on blue paper. Much value is added to this beautifully got-up work by the bibliography of the books Keene illustrated, and a catalogue of his etchings by Mr. W. H. Chesson. To those who have been associated in the production of this volume the task evidently has been a work of love.

"BUILDING NEWS" DESIGNING CLUB.

SMALL STABLE BUILDINGS FORMING LODGE GATE HOUSE.

THESE designs no not need much in the way of a description. The problem is unquestionably attractive, permitting of considerable picturesqueness of treatment, and the requirements are simple. Very few of the competitors, however, have risen to the ideal suggested, and none can claim (even if they tried to do so) to have realised a perfect scheme. "Byd" takes the first place, "Bantam" ranks second, and "Pantile" comes third. All three of these proposals are illustrated herewith, so that our judgment can be followed and, we think, confirmed.

To enable our readers to do this the more clearly we print as usual the conditions issued for competitors:—"Second List of Subjects.—(B) A small coachhouse and stable, forming an entrance-way to the grounds of a country house, the coachman's dwelling being included and used as the lodge for the approach. The building is to stand on the frontage line of the property facing a high road. The accommodation is to provide for four stalls and two loose-boxes; a coachhouse for four traps or carriages, a harness-room, and washing covered space, and a loft for hay and corn. The entrance-way to be large enough to drive through. The dwelling to comprise a small parlour, good kitchen, 16ft. by 14ft., and larder, small scullery, and wood-shed; three bedrooms, one of which to be reached from loft, for use of groom. A man's w.c. besides that for use of lodge. No limit is placed on the site frontage, which is straight and level, facing N.W. The price will govern the undertaking, and £1,500 is the contemplated outlay. Style to be suited to a stone district, and roof covered with tiles. Picturesque simplicity and grouping is to be aimed at, and fussy, meaningless detail avoided. Scale, 8ft. to the inch. The plans may be 16ft. to the inch if desired. A perspective view of the front is essential, and sufficient elevations and sections to illustrate the design properly."

The elevation of "Byd's" design is very good. It suggests a connection with an important house beyond, and as belonging to a well-considered scheme. The abutment quasi-towers have a made-up kind of look about them; perhaps, though, in old gateways similar precedents could be found. The clock turret seems a trifle too big, and the bay windows are a little too low for healthy living-rooms and ample light. We do not know what becomes of the man's room chimney: the turret absorbs it seemingly. The gatekeeper's lodge windows do not nicely command the gate, and the window of the front bedroom is omitted in the view. The gateway is large enough to drive through. With its faults well in view, we say this design is, on the whole, the most successful. "Bantam," the second man, gives us a good big gateway, and it has an air also of dignity; but similar faults to those already named in noticing the first design are also here evident. The perspective does not improve the look of the building, and the bell-turret, rising out of a lead flat, is not a great success. It cannot embrace the flue from the groom'sbedroom fireplace. So short a chimney, if it ends at the parapet level, would want a smoke cowl. Fancy somebody's patent like a gargoyle on end at the corner! "Pantile," we presume, means to rough-cast his masonry; but in the view he omits even the joint-lines of the quoins, which in the elevations are somewhat important. The entrance arch is rather small for a coach and four. The design of the iron gates suggests a chancel enclosure screen. The grouping is distinctly pretty, but the affectation of the battered tower suggests the sand-and-card castle style of thing, which, if built, would in reality weather badly, and look ineffective. The cottage as a lodge is better than in the first and second plans, and there is no doubt in this case as to what becomes of the man's bedroom flue. The chimney, in fact, is so big that its support might well cause anxiety on looking at the plan. The arrangement of the stable is not good, particularly the loose-box.

"Gib" makes a rather strong fourth in this little contest, sending us a design in rather a French style, prettily relieved by red bands of brickwork in the upper part of the stone walls. His gateway is low as compared with the others, and the general appearance of the group somehow suggests the entry of a public institution rather than a gentleman's house. This, possibly, is due to the style. The plan is rather a good one, and the drawings are usefully and nicely done. "Petticoats" is the author of one of the best designs, and sends a crisply-drawn perspective; but, refined as some of his detail is, we scarcely think his archway with the oriel over can be counted as a success. The big, ungainly bell-turret helps to spoil the effect; but the bays are pleasing, and the plan is good, though there is no attempt at a stableyard, as there should be, to inclose the ostler's work from too great a prominence. Here it is all open to the main drive leading up to the mansion. "The Man in the Moon" avoids that objection, and gives us a design marked by merit, though a little commonplace. The look-out oriel window under the archway and the porch to the cottage are points showing thought, which we have not overlooked, and we observe that the planning is nicely contrived generally. The drawings, too, are neatly executed. "Go" shows a spirited endeavour to obtain picturesqueness of effect, which we are glad to welcome. He mars his views by introducing patches of black, regardless of the perspective of colour. The stable plan is not convenient with one loose-box round the corner next the main entrance, and the design is rather too ambitious and lacking in breadth. So capable a competitor ought to improve. "The Maggot" does not attempt the archway arrangement; but he plans cleverly and designs with taste, knowing the value of plain wall-space. The tower located in the corner of the stable-yard is not a success, and somewhat weakens the merit of a meritorious composition of which we have taken full consideration. "R. W. F." separates his lodge too much in idea from the rest of the block, and the road front of the stables is too much like a farm building, while the long, ugly, curved-shaped dormers are unsightly, and so is the clock turret with its curve-gabled hood. "Bernard" makes a good big archway under a broken pediment, and his façade would look suitable and dignified; but we do not like the plan, and the perspective is not equal to the occasion. It shows how meaningless the second turret really is. "Microbe" brings the visitor right into the stable-yard, quite losing sight of the fact that the archway is to form an approach to the house beyond. He draws neatly, and avoids vulgarity, but he is lacking in "go." "Turret" should leave out figures, unless he can draw them reasonably well. The three gables over his central building are rather pleasing, and his plan has distinct merits. His gates of florid ironwork do not enhance the design, which is not particularly attractive. "Checkmate" makes a group of an ordinary lodge with stables at the rear, and an entrance gate with piers in the park wall. He does it suitably enough, but the real problem indicated by the instructions he has not undertaken. "Gossip" makes his archway too small, and leads us directly into the stable-yard. His elevation is well-designed and tastefully drawn with considerable care. "Stone" is too evidently inspired by a desire to make a small building assume the air of a big one, and the rear elevation is really better than the front. "Stone" draws neatly; but the elevation should have been drawn to ⅛th scale. "Strax" gives a block roofed with pantiles, and designed like farm-buildings, and no doubt in execution they would look well enough; but the special application of the composition to our requirements is not so evident. We do not like the T-shaped stable, and a hospital box is best isolated from the other accommodation. "Hotspur," with a little more taste and some further degree of skill, could have made his scheme more successful, for its central idea is decidedly a good one, with the coat of arms carved within a shaped pediment over the archway which is situate in the middle of a long line of roof. As it is, the detail is very poor, and the drawings are indifferent. "Hotspur" must continue, and not grow cool in his ardour: he ought to improve. "Spark" gives us a block of stables and a house attached, but they might be anywhere. They would look fairly right; but if we passed them, there would be nothing to excite attention on repassing, while the plan gives no suggestions. "Spark" needs inspiration. "Centaur" has spared no trouble, and we praise him warmly for thus doing his best. There is nothing to particularly avoid in his design; the stable front towards the yard is pretty, and he pleases us by his quiet simplicity, but a little more life another time would improve the author's chances of success. So good a worker ought to succeed. "Dach's" also has had a good try, though his attempt at originality looks better in elevation than in the view. The stable on plan is exceedingly cramped; the doors would nearly touch the horse's heels. Fancy a restive mare in stall No. 2; she would kick herself to pieces, and the stable-door too. "The Ant" marks his entrance by a square tower, and he knows the value of simple proportions. The object of the court to the rear is not so evident. "Derige" is a weak draughtsman, but his work suggests a tastefulness which we should like to see cultivated. The horizontal beam of the carriage gateway, and the timber-work over, and also io, the gables bespeaks an idea of good work, and so does the quaint little bay; but the whole thing is but indifferently worked out. "Hubert" is commonplace. "Solo's" design is a trifle better, but not so well drawn. "Sir Galahad" imitates a Jacobean gatehouse, with turrets flanking the gable, which is stepped. With this somewhat monumental aim, the strut-like bald buttresses alongside look very ill at ease. The remaining designs we have thus classified:—"Wun-Hi," "Joy," "Eric," "Phantom," "Nowhere," "Stanley," "Crow," "Vim," "Bull's-eye 5," "Klondyke," "Bonum," "Consilium," "Wen," "Spero," "Pick-me-Up," "Rosecomb," "Eldon," "Olliwops," "Wessex," "Orb," "The Bowery," "Kirby Hall," "Excelsior," "Inexperienced," "Mac," "Suburb," "Oak," "Spectator," "And Co.," "Chess," "Ravenna," "Cobden," "Don," and "Bow Bells."

A Local Government Board inquiry was held at Ramsbottom on Friday into an application for sanction to borrow £15,000 for sewage works, and £5,000 for street improvements. Already £32,000 has been borrowed. The inspector adversely criticised the council's action in proceeding with the sewage plan at Lower Summerseat without the board's sanction, and also referred to the heavy extras incurred on the original contracts.

Out-patients' buildings have just been added to the Medical College at Calcutta, and will be opened this month. Mr. W. Banks-Gwyther, A.R.I.B.A., is the architect, and the execution was superintended by Mr. B. K. Finnimore, Executive Engineer, 1st Calcutta Division, assisted by Mr. G. Trusler, who has been in immediate charge throughout. Externally the building is of red brick, with pale pink terracotta dressing and ornamentation from the potteries of Messrs. Burn and Co., at Raneegunge.

BUILDERS AND THE WORKMEN'S COMPENSATION ACT.

AN address on the provisions of the Compensation to Workmen for Injuries Act of 1897, which comes into operation on the 1st of July next, so far as they affect builders and contractors, was delivered by Mr. W. H. Brown, solicitor to the Bristol Master Builders' Association, before the members of that body on Monday night at the Guildhall, Bristol. Mr. August Krauss, President of the Association, occupied the chair, and there was a large attendance of members.

Mr. Brown said:—The perusal of the Act has brought very forcibly to my mind the fact that its conditions largely increase the liability of employers, so much so, indeed, as to make one regard the Act as the most sweeping and far-reaching statute for the benefit of workmen which has ever yet passed the Houses of Parliament. Before the passing of the Employers' Liability Act of 1880, an employer was liable at common law to his workmen under certain circumstances, because the master was bound to provide proper materials and appliances for his workmen, and was also bound to take other reasonable and proper precautions for the safety of his workmen; but this liability was practically a personal one, and unless there had been personal negligence on the part of the master, there was rarely, if ever, any liability attached to him. This common law liability has not been in any wise decreased by the passing of the Employers' Liability Act or the Workmen's Compensation Act. The operation of each of these Acts has been only to extend the liability and take away some of the employers' defences. The complaints against the efficiency of the Employers' Liability Act from a workman's point of view led up to the passing of the Workmen's Compensation Act, which was originally intended to come into operation on 1st January, 1898, but was then extended to March 31, and will now come into force on the 1st of July next. The extension of time has been made with the view of giving large employers an opportunity of making arrangements with their work-people, and of formulating a scheme of compensation to supersede the Act. As most of you are more or less familiar with the provisions of the Employers' Liability Act, I have thought it advisable to point out the main points of difference between that Act and the new one. These are:—(1) Pure misadventure or accident is no longer a defence. Formerly it was. (2) There is now liability in respect of the negligence of any person, whether in the employers' service or not. Formerly limited to negligence of foremen. (3) The workman's knowledge of a defect is no longer a defence. Formerly it was. (4) Contributory negligence can no longer be pleaded, except it amount to wilful and serious misconduct. Formerly it could. (5) The defence of common employment is completely gone. (6) There can be no contracting out except for equal or greater benefits. Formerly contracting out on any agreed basis was permissible. (7) There is now liability for subcontractors' men. Formerly there was none. (8) There is now a liability in respect of workmen engaged in manual labour or otherwise. Formerly the restriction was to persons engaged in manual labour. Then, as regards procedure, there is some slight difference with reference to notice and time for bringing the action, as the notice must be given as soon as practicable and the action commenced within six months, whilst with regard to actual proceedings the whole county court work as it now stands is swept away and a scheme of arbitration substituted. Most of these points will come under notice if I take the Act section by section as briefly as may be. The first section of the Act deals with the liability of certain employers to workmen for injuries, and a later section defines what employment the Act refers to, and included in the list is "employment on, in, or about any building which exceeds 30ft. in height, and is either being constructed or repaired by means of a scaffolding or being demolished, or on which machinery driven by steam, water, or other mechanical power is being used for the purpose of the construction, repair, or demolition thereof." The scale of compensation is set out in the first schedule of the Act. A claim can only be made in respect of an accident arising out of and in the course of employment. This definition will probably give rise to a considerable amount of litigation before its exact meaning gets finally determined. If the accident arises out of or in the course of the employment, it will not matter what circumstances led up to the accident, and it will be no defence for the employer that the accident was one which could not have been avoided, or even that it was brought about by someone who was altogether outside his employ; but in this latter case the employer can look to the person who caused the accident for indemnity, providing that person would have been legally liable to the workman, and the workman himself has the option of proceeding either against the master or against the outside person causing the accident. This liability of the master is an extremely wide one, and there are practically only three cases in which there is no liability on the master's part:—1. Where he can show that the employment is not within the Act. 2. Where if the employment is within the Act, the accident did not arise out of and in the course of the employment. 3. Where the person injured has been guilty of serious and wilful misconduct, to which misconduct the accident was attributable. After referring to the compensation provided by the schedule, he went on:—Sub-section B of Section 2 reserves to the workman any remedies he formerly had against his employer, but the workman must elect whether he will claim compensation under this Act or under his remedies prior to the Act coming into force. It will be seen that under this sub-section the employer is not to be liable to be proceeded against independently of this Act except in case of personal negligence or wilful act of himself or some person for whose act or default he is responsible; but having regard to the many cases which have dealt with the principles of the employer's liability at common law, it is probable that it will be found that the existing common law liability of the employer has not been very much affected by this sub-section. With regard to the limitation to the personal negligence or wilful act of some person for whose act or default the employer is responsible, this is a pretty plain reference to the employer's liability under the Act of 1880, where the employer is made liable under five distinct cases. In three of these cases the injury must arise from the negligence of the persons referred to, and it is believed the workman's remedy in those cases is left untouched, and although in one other case—namely, the first—the wording may at first lead one to doubt whether its effect has been altered, yet a careful consideration of the first of these cases leads me to the conclusion that the workmen will still have the option of proceeding under the Act of 1880 or under the new Act. With regard to the option reserved to the workman of proceeding either at common law or under the Employers' Liability Act, or to his representatives of proceeding under the Fatal Accident Act of 1846 instead of under the present Act, if an action is brought outside the present Act and upon the hearing it is decided that the employer is not liable in the action as brought, but that he would have been liable if such action had been brought under the present Act, then the court, if requested to by the plaintiff, must assess the compensation which would be payable to the plaintiff if the action had been brought under the present Act, but in determining such compensation the court may deduct the extra costs incurred by reason of the action having been wrongly brought in the first instance. It will thus be seen that the new Act, instead of taking away any of the old remedies which the workman had, has given him an entirely new one, and has given him the opportunity of proceeding in any way he pleases, with the certainty that if upon the hearing of the case it be found that he has made a mistake in electing to proceed under an Act which gave him no remedy, yet if he had a remedy under the present Act he will not have to take fresh proceedings, but will get an award at once. Sub-section C provides that the employer shall not be liable if the injury to a workman is attributable to the serious and wilful misconduct of that workman. It will probably be found that this will be a most difficult defence to establish, because the onus of proof is thrown upon the employer, and it will be necessary to show not only that the workman was guilty of serious or wilful misconduct, but that the injury was attributable to such misconduct. Section 3 of the Act provides that the whole question of compensation, whether as regards liability or as to the amount or duration of the compensation, shall be settled by arbitration. I have previously incidentally mentioned that there is no power to contract out of the Act except as provided by Section 3. This section provides that if a scheme is drawn up between the employer and his workpeople for the compensation, benefit, or insurance of the workpeople, and such scheme is on the whole not less favourable to the general body of workmen and their dependents than the provisions of this Act, then the Registrar of Friendly Societies can give a certificate, and until the certificate is revoked the employer can contract with any workpeople who assent to the scheme that they shall be subjected to the provisions of the scheme instead of the provisions of this Act. Such certificate may expire at the end of a limited period, not less than five years. No scheme can be certified which obliges the workman to assent to the scheme as a condition of obtaining employment. Under certain circumstances, if complaint is made to the registrar, and such complaint is shown to be well founded, the registrar can revoke the certificate, and shall do so unless the cause of complaint is removed. It will be seen that the widest discretion is given to the registrar in approving any scheme, and it will not be absolutely necessary that the scheme shall provide for greater compensation to be paid in case of accident, because other benefits may be given to the employed than those which are provided under the Act, and these may be held to be substantially greater than the benefits under the Act. Section 4.—This section makes the employers liable in respect of any work being executed by a sub-contractor. This is an extension of liability, as neither at common law nor under the Employers' Liability Act did it exist. Section 5.—This section gives the employed certain securities for compensation in case of bankruptcy. In the event of bankruptcy of an employer who is not insured the injured workman will come in as an ordinary creditor; but where the employer is insured against accidents the workpeople have the right to any moneys payable by the insurers, and this section provides how such moneys may be invested. Section 6 provides that where the injury for which compensation is payable was caused under circumstances creating a legal liability on some person other than the employer, the workman may proceed against such other person or the employer, but not against both. If the employer is proceeded against, he has the right to be indemnified by the other person. There will probably be considerable difficulty in the practical working of this section, because it will be very difficult to ascertain in some cases the amount required to indemnify the employer. Take, for instance, the case where weekly payments have to be made for a long term of years. The only other point to be considered is as to what is a building within the meaning of this Act. The building trade itself does not fall within the description of one of the employments mentioned in the Act, unless it is in respect of a building of over 30ft. in height, as before referred to. There does not appear to be any provision in the Act for determining how the height of the building is to be measured—whether it is to be from the front, or the back, or the side, or whether it would be sufficient if any part of the building is over 30ft. in height. The only known statutory definition of the height of a building, and how such height is to be ascertained, is in the London Building Act of 1894; and although this definition will certainly not be binding upon any arbitrator under the present Act, it may yet serve as a guide for any measurements under this Act. The framers of the Bill appear to have been anxious in this Act to prevent litigation so far as possible; but, as they had left it quite an open question as to how the height of a building is to be determined, there is little doubt that considerable litigation will ensue over this point before the correct mode of measurement is definitely ascertained. It will be noticed that, in addition to the building being required to be one of over 30ft. in height, it is also necessary either that scaffolding should be in use in the work, or else that the machinery mentioned in the schedule should be in use upon the building. This reservation as to scaffolding or machinery will not apply in the case of a building which is being demolished. You will, I think, have gathered that the present Act puts upon your shoulders as employers a very large additional liability, and one of so serious a nature that it will be a matter of grave consideration whether any employer of labour will elect to take the whole of the risk upon his own shoulders. It appears to me that the Act is likely to develop

insurance to a degree never before known. Of course, some of the very large employers of labour may prefer to be their own insurers, or they may have such a large number of workmen that it will be comparatively easy for them to frame some scheme for approval by the registrar in substitution of their liability under this Act; but for all except the very largest employers it would seem to be almost as much a necessity to insure against the liability created by this Act as it is for any owner of property to insure against fire—in fact, the arguments in favour of insurance are even stronger in the present case than they are in the case of fire, because if a man loses his property by fire he knows practically the extent of his loss, whilst under this Act his liability is by no means easily ascertained. The most serious point in the Act, in my opinion, is that, although in case of death there is a maximum compensation fixed, and that upon this point the employer can calculate his maximum liability, yet, in the case of total disablement, the liability to contribute towards the injured person extends for the remainder of the injured person's life, and it will, therefore, in most cases be found that not only is the loss to the employer far greater in case of disablement of workmen than in case of death, but that the difficulties of dealing with compensation for disablement cannot readily be overcome. It may well happen that an accident may occur which will disable two or three or five or more comparatively young workpeople, and the liability will then be created to pay them a certain sum of money for their lives. They may outlive their employer, and the gravest difficulty would arise in such a case in dealing with the estate of an employer saddled with such liabilities. It is quite true that the employer has the option after six months of getting an assessment of the sum to be paid by him in lieu of future payment; but in many cases the employer will probably hesitate to take this course, because the arbitrator will have considerable difficulty in fixing any such sum except upon an actuarial basis, and this would in many cases amount to a larger sum than the employer would be likely to desire to pay. I cannot help saying that I think it will be found that in the working out of the Act the absence of a limit to compensation will be found the most serious part of the Act with which the employers have to deal.

On the proposition of Mr. George Humphreys, seconded by Mr. George Wilkins, Mr. Brown was thanked for his address.

REFERENCE BOOKS ON ORNAMENT AND THE DECORATIVE ARTS.*

I MUST ask you to carefully keep in mind the limitations imposed by my title, for I propose only to bring to your notice books which do not overlap in the treatment of their subjects, and please also remember that, as I am dealing with reference books only, my list must of necessity be brief. I intend classifying my subjects under the following heads:—In the first place, a few textbooks on the general principles of design and ornament, not referred to under special divisions. This list is short, and the titles are familiar. The smaller books on special subjects will be referred to in their places. Next the larger division — general reference books — and then books on special branches of the decorative arts. First, then, the smaller textbooks not mentioned under separate heads:—Jackson's "Lessons on Decorative Design" and "Theory and Practice of Design," Lewis F. Day's "Anatomy of Pattern," "Planning of Ornament," "Application of Ornament," and "Some Principles of Every Day Art," Ward's "Principles of Ornament," "Practical Designing" by various authors, edited by Gleeson White, Professor Meyer's "Handbook of Ornament," Wornum's "Analysis of Ornament," Moody's "Lectures on Art," Ruskin's "Lectures on Art," Sir E. J. Poynter's "Lectures on Art," Aldam Heaton's "Beauty and Art," Collier's "Little Primer of Art," Redgrave on "Design," and Taylor's "Elementary Art Teaching." Of course, the library should possess a good selection of the invaluable series of handbooks issued in connection with the South Kensington Museum. They comprise short historical and illustrated accounts of almost all artistic industries, by eminent authorities on their subjects. I should also like to direct your notice to a similar and equally commendable series issued in France under the title of "La Bibliothèque de l'Enseignement des Beaux-Arts." Some fifty of these manuals have been published at very modest prices, and among them are to be found works on many subjects outside the range of the South Kensington series. Most of the volumes in these two series of textbooks deal with special subjects, but after reference to them here I shall not particularise when I come to the subjects they touch upon, but leave you to find from the published lists which volumes are specially suitable to the wants of your readers.

GENERAL REFERENCE BOOKS.

First in a reference library should be found a good history of art, and that which comes first to one's mind is D'Agincourt's "History of Art by its Monuments from the 4th to the 16th Centuries," first published in Paris in 1823, translated by Owen Jones, and published in English in 1847. It illustrates 3,000 examples of architecture, sculpture, and painting, and the late Sir Matthew Digby Wyatt said of it some years since: "It is one of the attributes of this book that it can never fall out of date. It illustrates what must ever be the great wells from which artists will have to draw inspiration, and it is one amongst very few great works produced during the 19th century which is calculated to do more than minister to passing fashions in art." There have been one or two modern imitations of this book, but to my mind they fall very far short of its excellence and completeness. To those who desire smaller works I should recommend Lübke's "Histories of Art and of Sculpture," each in two vols. 8vo. For a full account of Eastern and Asiatic art we must turn to the volumes, produced in a handy form and brought down to date, by MM. Perrot and Chipiez, two energetic and able French archæologists, of which works English editions have been produced, and form twelve volumes, 8vo. For a small and comprehensive work I propose Von Reber's "History of Ancient Art," an 8vo published in 1883. Mr. J. Ward, of the Macclesfield School of Art, has just published a manual on "Historic Ornament," which has illustrations selected from the works of Perrot and Chipiez, and other authorities. In a prominent position I must place that beautiful and invaluable book, Owen Jones's "Grammar of Ornament," which, first published in its original large folio form in 1856, served for more than a generation to enlighten our decorators and manufacturers in the principles and adaptability of design and colour, and it is now difficult to imagine how they and hosts of others managed before the existence of the epoch-marking "Grammar of Ornament," which is now to be found in its original, or reduced and very inferior form, in most of the libraries, art schools, studios, or drawing offices of the world. But extraordinary as that publication was for its time, so much has since been learnt concerning Historic Ornament, so many delightful examples, more particularly of the Eastern and Renaissance styles, have been studied and drawn since its publication, and such improvements made in the art of chromolithography that I think it indispensable the two magnificent volumes by M. Racinet, issued under the title of "L'Ornement Polychrome," should be added to the library. In these volumes are 220 coloured plates, illustrating nearly 4,000 examples of ornament, not, with a few exceptions, found in Owen Jones's work. An English translation of the first series was published in 1877; but the second series, issued some eight years ago, has not been translated, and consequently is not so generally known in England as the first. To these works on coloured ornament I feel bound to add Owen Jones's "Examples of Chinese Ornament," a small folio volume which appeared in 1867. Its value, which cannot be realised from the title, consists in the varied examples it affords of the conventional treatment of flowers. The remarkable ingenuity shown by the Chinese in the treatment of floral forms in their application to decorative purposes renders the book invaluable to designers. I will here mention the extraordinary glossary of "Historic Costume," by M. Racinet. Its six volumes contain 500 plates, more than half of which are printed in colours, illustrating not only the costume, but house interiors, furniture, armour, and jewelry of all nations, and throughout all ages, so that it really forms a work of wider extent than is implied by its title. It is a most fascinating book to look over, and to show the careful manner in which it has been compiled, I may mention that the list of authors from whom illustrations have been culled occupies some twenty-five pages. Various works have been published, each devoted to the ornament of an Oriental country; but these we cannot expect to find in a library of moderate compass, and the key to decoration in the various styles is contained in Owen Jones's and Racinet's works. The two reference books next on my list are French, the first being Viollet-le-Duc's "Dictionnaire du Mobilier Français," in six vols. 8vo, issued about 25 years ago. This, with the same same author's "Dictionnaire de l'Architecture Française," is of world-wide repute. I think the following note by Mr. Russell Sturgis, a well-known American authority on Art subjects, worth quoting. Writing of the "Mobilier," he says: "This work is several dictionaries in one. The first volume is devoted to furniture, with, as appendix, some very interesting essays on the method of construction in the Middle Ages. The second volume deals with utensils in one alphabet, then with goldsmith's work, then with musical instruments, and then with sports and pastimes, including hunting and the tournament, and gives finally a few pages to tools of the carpenter, blacksmith, &c., a very curious encyclopædia of life in the Middle Ages. The third and fourth volumes are devoted to dress, the fifth and sixth to armour and weapons. The text is throughout of the most suggestive character, and generally trustworthy; the illustrations have that extraordinary value which belongs to the author's drawings." As you will see, the book deals most exhaustively with French Mediæval art; but, as a sequel, dealing mainly with art in the Renaissance period, should be added Harvard's "Dictionnaire de l'Ameublement et de la Décoration." Monsieur Havard devoted some fifteen years to the preparation of his work, which was issued between 1886 and 1890, and forms four volumes, 4to, having 250 plates, many printed in colours, and 2,500 smaller illustrations, including not only representations of furniture, but examples of the methods of producing it. The only small books in English which treat of the arts in anything like a comprehensive manner are Labarte's "Handbook of the Arts of the Middle Ages," and "The Decorative Arts of the Middle Ages," by Henry Shaw, both issued between 1850-60. I need hardly say that the beautiful works issued by this thorough antiquarian and art lover are worthy of all praise. I shall here include Augustus Pugin's "Glossary of Ecclesiastical Ornament and Costume," first issued in 1844, since it illustrates not only vestments, the ecclesiastical ornament of different countries, &c., but furniture, embroidery, and emblems as well; also J. H. Waring's "Arts Connected with Architecture in Central Italy," a folio issued in 1858, as the coloured illustrations are comprehensive, including examples of stained glass, fresco ornament, mosaic work, marble, and wood inlay. For a small dictionary we should have Mollet's "Dictionary of Terms Used in Art," an excellent little work compiled from various sources, issued in 1883. Amongst these reference books should certainly be found Gruner's "Specimens of Ornamental Art," selected from the best models of the Classic periods, as its eighty large folio plates give an unsurpassed series of Classic and Renaissance ornament drawn to a large scale. It was first printed in 1850, but is still unique on account of the scale of its drawings. Then I should like to mention a publication issued by an enthusiastic German antiquarian, Herr Hirth, and entitled "Der Formenschatz," also published under the French title of "L'Art Pratique." Since 1877 this gentleman has sent forth a yearly volume containing some 200 plates of photo-lithographic reproductions of work in every branch of ornamental design by the old masters of ornament in various Continental countries. These volumes are published at a very moderate price, and when we bear in mind the sum that a few of the original plates by any of these designers would cost, we must regard the collection as very remarkable and very valuable. The *Athenæum*, recently reviewing the last volume, speaks of the plates being a "perfect treasury of memoranda of all sorts." A sumptuous series of volumes has been published illustrating the marvellous collection of objects of art, formed by M. Spitzer, and dispersed a few years since. These, however, are so costly that they can only be contemplated for purchase by the richer libraries. A small folio catalogue illustrated by photographs is occasionally to be met with. I should like to draw your attention to a volume which is now to be met

* Read before the Twentieth Annual Meeting of the Library Association, by Mr. HERBERT BATSFORD.

with at a moderate price, illustrating the art treasures of the exhibition held at Manchester in 1857. My reason for mentioning this is that the works illustrated are, with few exceptions, old examples, well printed in colours, accompanied by valuable essays on the different arts by such authorities as Owen Jones, Sir Matthew Digby Wyatt, Edmund Sharpe, &c. This volume, I believe, is often confounded with others illustrating modern examples in exhibitions, and is consequently overlooked.

(To be concluded.)

INFLUENCE OF SEA-WATER ON MORTARS.

M. E. CAUDLOT, in a recent paper, describes the action of sea-water on mortars, and his investigations in the harbour of La Rochelle since 1856 are of much value, as they extend over a period of 10 years. Blocks of 60 centimètres in length were exposed to the open sea from 1856 to 1875, and were above the water-surface at low tide. The mortars were of hydraulic limes of different origin, of natural cements from Pouilly, Vassy, &c.; of artificial pozzuolanas mixed with lime and sand; of trass from Andernach, &c. Nearly all blocks had completely lost their cohesion after different periods. The few blocks of Portland cement experimented upon were in good condition; but blocks of neat cement (English and French) were decomposed. From these tests Viennot draws the following conclusions: (1) Neat cements are destroyed more rapidly than mortars of a certain composition; (2) mortars made of one volume of cement to one of sand, and, again, of one volume of cement to two of sand, are those which offer the greatest resistance to sea-water. They will last for 20, 36, and 38 years.

Thurninger commenced new tests with blocks of masonry, and concrete made of lime and Speil mortar, with a length of edge of 40 centimètres. In 1895 the masonry blocks disappeared, their destruction having commenced four years after their exposure, and out of 32 concrete blocks only 26 remained, but they were in advancing decomposition. In 1880 other tests were commenced on blocks submerged, of various limes. Many of these have perished. "Out of 31 masonry blocks laid in Portland cement mortar, and submerged between 1881 and 1892, 23 are still intact, while some have commenced to disintegrate." Viennot points to the following conclusions: (1) Mortars of hydraulic lime, mixed in any proportion, in most cases commence to disintegrate after one or two years' immersion in sea-water; they crumble into pulp after periods varying in length, but apparently not exceeding 15 years. (2) Concrete resists better than masonry, owing to the greater density imparted to it by ramming. (3) Rapid-setting cements may commence to disintegrate after six or eight years, but may last longer than 38 years without crumbling. (4) The mortars offering the greatest resistance are those consisting of 1 part cement to 1 or 2 parts of sand. This mixture corresponds to the weight of cement required to fill the spaces between the grains of sand. These, therefore, are the least porous mortars.

A NEW BOOK ON OLD FURNITURE.

MR. BATSFORD has just published a volume of examples of historic furniture* which many of our readers will welcome, although the drawings have all appeared in our own pages; the sketches are reproduced to a larger scale and printed on plate paper in a rearranged form, accompanied by descriptive letterpress by the author of the drawings, Mr. A. Ernest Chancellor. The selection covers a wide range of subjects, more especially of English workmanship, including, not only typical examples of well-defined periods, but also unique specimens and uncommon varieties, which derive additional interest from some charm of singularity or freshness of idea. A very large number of the pieces was sketched at Christie's salerooms when famous collections of furniture changed hands, and others were drawn during the exhibition of loan collections in London during the past few years, so that by these means access was obtained to some of the most remarkable examples of old furniture extant. The book includes forty plates of about one hundred specimens, including a number from the Halls of the City companies. Some are measured and drawn to scale, and details of the manner of contriving internal arrangements or peculiarities of construction are furnished in other instances, while in most cases figured dimensions occur in the letterpress. The volume is handsomely produced, and makes a good book for reference for the cabinetmaker, architect, art collector, and decorative designer.

FOUNDATIONS ON CANTILEVER TRUSSES.

AN ingenious method of preparing foundations for small buildings for storage purposes is described in the *Engineering Record*. The system applies the cantilever principle to the support of the walls of a building 116ft. high, and has been devised by Mr. W. W. Crebore, A.M.A.Soc.C.E., and Frank Miller, C.E., of the Structural Engineering Company. The plan avoids all the difficulties and expense of constructing foundations on loose or uncertain ground like that of New York. The building described is 25ft. by 85ft., and is of the usual skeleton-cap construction. The structure is supported entirely by two rows of six columns each, each row being built in the thickness of the party wall. Cylindrical steel caissons, 5ft. diameter and ⅜in. thick, from 12ft. to 16ft. long, were used; these encountered some difficulty in sinking in some parts till the rock was reached, which was inclined and irregular, and for this purpose sheet-pile or "lagging" had to be used; driven down to the rock on the deepest side. Sometimes the rock was stepped with benches. The caisson was filled with concrete, mixed wet, and rammed in footlayers. These caissons were ranged within the line of walls and clear of the footings, and the cantilever trusses enabled the side walls to be carried beyond the line of caissons. Their centres were 16ft. apart transversely, and also in a longitudinal direction. These trusses were riveted, having two chords and lacing pieces, and resembled in elevation two inverted triangles, connected top and bottom by the chords, 10ft. high. Thus, the spaces of the triangles rested on the bare stone of the caisson, and allowed the walls on each side to overhang nearly 4ft. 6in. in the line of the caissons or supports. All pairs of columns are thus supported on cantilever trusses, except the front pair, which are carried on twin plate girder cantilevers introduced on the front of the building. By the means here described, the walls of a building can be carried on supports placed some distance within the lines of the outer walls, and the whole weight of the superstructure of beams and columns is carried on twelve foundations or caissons that can be placed at any convenient distance apart.

Mr. Charles Wood has been promoted from the position of deputy manager to that of gas engineer to the Bradford Corporation, in succession to his father, deceased. The salary will be £600 a year, and the committee are about to advertise for a deputy manager at £250 a year.

It has been decided to adopt plans by Mr. J. O. Scott, for the restoration of the chancel of the parish church of Pipe-Ridware, Salop, at an estimated cost of £1,100.

Mr. Walter A. Ducat, one of the Local Government Board Inspectors, held an inquiry in the Guildhall, Canterbury, on Tuesday week, into the application of the city council to borrow £4,123 for the purchase of certain property in Guildhall and High streets, upon which they could either erect a new town-hall or extend the present building.

Mr. Isaac Wildash, for the past fourteen years surveyor to the Faversham Rural District Council, died last week from the injuries sustained by being thrown from his trap while engaged in his duties on the 8th inst. At the inquest held on Wednesday week a verdict of "Accidental Death" was returned; and at the meeting of the rural council, on the same day, a vote of condolence was passed to the widow and her family, and it was resolved to advertise for a successor at a salary of £200 a year. Mr. Wildash was 59 years of age.

The monthly report of the Labour Department for December states that in the building trades the percentage of unemployed union members was 2·8 at the end of 1897, compared with 2·1 for December, 1896. In the furnishing trades the percentage of union members out of work was 4·7, compared with 4·3 per cent. for December, 1896.

Engineering Notes.

PROPOSED THAMES LOCK AT WANDSWORTH.—A conference of representatives of riparian authorities on the Thames between Isleworth and Fulham took place at the Hammersmith Town Hall on Friday, to consider a new report from Mr. E. Pritchard, C.E., of Birmingham, with regard to the construction of a lock on the Lower Thames. Mr. Pritchard had been requested to report with regard to a site at the foot of York-place, Battersea, midway between Wandsworth Bridge and the West London Extension railway-bridge. He reported that this site was much superior and more suitable than Broomhouse Dock½ half a mile below Putney Bridge, the river being narrower, and that locks and sluices could be constructed there to hold up from six to eight feet of water above low-water springs, according to requirement, for £220,000. He advised the construction of half-tidal movable stone sluices, and a bridge to connect Battersea and Fulham with four central spans of 110ft. each. He also advised the construction of four locks upon the Middlesex side. The conference was well attended, a representative of the Wandsworth and Putney Board of Works, which had a rival scheme of its own at Broomhouse Dock, being present for the first time. It was unanimously agreed to recommend the scheme, with conditional approval, to the various constituent bodies for consideration.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

DUBLIN MASTER BUILDERS' ASSOCIATION.—The annual general meeting of the Dublin association was held at the Grosvenor Hotel, Westland-row, on Friday, the 14th inst., when the following officers were elected for the present year:—President, the Right Hon. Joseph M. Meade, P.C., LL.D.; committee, James Beckett, Richard D. Bolton, Thomas Conolly, Thomas Mackey, James Martin, James P. Pile, John Pemberton, Henry Sharpe, J.P., and Alderman Toole; James Kiernan, hon. treasurer; John Good, hon. sec. The report for the past year having been read and adopted, a resolution of condolence with the family of Mr. James Conolly, a much respected and prominent member of the association, was passed.

GLASGOW ARCHITECTURAL ASSOCIATION.—On Tuesday, the 11th inst., Mr. J. Kennedy Hunter, of Ayr, read a paper on "Some Points in Practice." The president, Mr. William Tait Conner, A.R.I.B.A., was in the chair. The lecturer spoke of the relations of the architect to the client, the contractor, and to his fellow architects. He favoured a fixed fee rather than a percentage, though an architect had no option but to grant a certificate to a contractor for work done, less the usual percentages; objected to architects' guarantees in competition, preferring an estimate by a skilled measurer; concluding by cautioning the members against accepting responsibility for the clerk of works, who was the client's servant. Mr. W. J. Anderson, A.R.I.B.A., opened the discussion. He hardly knew whether the client who did, or who did not, employ one was most troublesome. Mr. W. F. McGibbon, A.R.I.B.A., agreed that good architects deserved the standard percentage, but thought the fact that some got half or quarter of that was scandalous. Mr. John Fairweather, A.R.I.B.A., did not object to lump sum fees if they were big enough. The Chairman handed over the vote of thanks proposed, and referred to the gift of the Gildard Memorial Committee.

Mr. George Elkington, F.R.I.B.A., 95, Cannon-street, has been appointed to the surveyorship of the Coopers' Company, of which he has been a liveryman for 25 years. Mr. Thomas Barnes Williams, the retiring surveyor, has accepted a seat on the Court of Assistants.

Extensive improvements have been carried out at the Sittingbourne Waterworks, situated at Keycol Hill, two miles from the town. Powerful engines and pumping machinery have been introduced, and a new reservoir, capable of holding 300,000 gallons, and other buildings, have been erected, the whole work being executed at a total cost of £6,000. The finishing touch to the scheme was given on Saturday, when the members of the Sittingbourne Urban District Council paid an official visit to the works to inaugurate the electrical installation which has just been completed there.

"ELEPHANT AND CASTLE" ESTATE.

THIS block of buildings is designed to cover the site of the present Elephant and Castle Hotel, together with the shops adjoining. The estate forms an island, which is well known, and is in a very conspicuous position, the headway facing the north, and having a frontage to Newington Butts and Walworth-road of about 80ft., and an average width of 34ft. will be occupied by the new hotel. The ground floor of the hotel is divided into saloon, luncheon, private and public bars, and the basement has a three-table billiard-room and cellarage accommodation. On the first floor are a double table billiard-room and large dining-room; on the second and third floor fourteen bedrooms and two large sitting-rooms, and on the top floor kitchen and domestic offices and four bedrooms. There is a separate staircase to domestic part. The other part of the site, which also has about an 80ft. frontage to Newington Butts and Walworth-road, and an average width of about 42ft., and return frontage to Short-street, consists of nine lock-up shops on the ground floor, with basements. The first floor is approached by a fireproof staircase from Newington Butts, and is designed for three suites of offices. The three upper floors have a fireproof staircase, approached from Walworth-road, and planned for eight separate suites of residential flats. The whole of the floors will be of fireproof construction, and the drainage and sanitary arrangements are to be carried out in the most modern manner, and the whole block lighted by electricity. All elevations are to be faced with cut and gauged red bricks and Portland stone dressings. All columns and piers to the ground floor will be granite, and the facia and cornices to the hotel part will also be of granite. The dome and two smaller turrets will have copper roofs; the sign "Elephant and Castle" will also be gilded copper. Other portions of the roof will be covered with Westmoreland green slates. Mr. H. L. Holloway, of Deptford, is the builder, and the amount of his contract is £36,000. The architect is Mr. John Farrer, of 20, Finsbury-pavement, E.C.

"HERMIONE": ROYAL ACADEMY SILVER MEDAL DESIGN FOR A DRAPED FIGURE.

HERMIONE stands in a niche in the chapel, draped as a statue, and holding with one hand a black velvet pall. Marble-like and apparently lifeless, she awaits Paulina's word, which shall bid:—

> Music, awake; strike!
> 'Tis time; descend; be stone no more; approach;
> Strike all that look upon with marvel.
> (*Winter's Tale.*)

—M. Y. TOWGOOD.

"SUMMERDALE," EPSOM.

THIS house occupies a beautifully timbered site in the Burgh Heath-road, and was erected for Mrs. M. Wood. It is faced with Bracknell red bricks, the upper portion being weather-tiled: the roof is tiled. All the internal joinery is of Oregon pine, stained and beeswaxed. The house was designed by Mr. J. Hatchard Smith, 11, Moorgate Station-buildings, London, E.C., Mr. J. A. Jeal, of Epsom, being the builder.

WALTHAMSTOW PUBLIC BATHS.

THIS design was placed first in this much-discussed competition by Mr. Rowland Plumbe, F.R.I.B.A. The site is situate in the High-street, and adjoins the Public Library, erected from my designs (BUILDING NEWS illustrations, September 28, 1894), and opened by Mr. J. Passmore Edwards. The accommodation provided is as follows:—Swimming-bath 128ft. by 35ft. (water area), 31 slipper baths, with waiting-rooms, superintendent's office and quarters, ticket office, club rooms, laundry, boiler-room, space for storage purposes, and other appurtenances. The estimated cost is £7,000, subject to 10 per cent. The decision of the assessor, who said that the building was "distinctly well designed and thought out, and appeared to have been designed with a view to being carried out for the estimated amount," was confirmed by the council who instituted the competition. This decision has been reversed by a new council, and the design placed second, entailing increased expenditure, adopted, under circumstances now being dealt with in your correspondence columns.

J. WILLIAMS DUNFORD.

"BUILDING NEWS" DESIGNING CLUB: A GROUP OF STABLE BUILDINGS.

(FOR description and further sketches see pages 86 and 87.)

CHIPS.

The Charing Cross, Euston, and Hampstead Railway Company have deposited a Bill for powers to extend their authorised line from a point under Charing Cross-road, near the Garrick Theatre, to a point under No. 23, Craven-street Strand. This extension is to be in substitution for the authorised Charing Cross terminus, which it is proposed to abandon.

Work was commenced on Tuesday on the extension of the Mashonaland Railway to Salisbury. Up to date some ninety miles of permanent way material has been shipped from England. The contractors, Messrs. Panling and Co., are sending material forward from Beira at the rate of 100 to 200 tons daily. Sir Charles Metcalfe, the engineer, is now busy at Umtali arranging for the station at that place.

The tramways committee of Glasgow Corporation have recommended the acceptance of an offer from a foreign firm for the supply of tramway rails. The rails are required for relaying Springburn route, which is to be worked by the electric overhead-wire system, and for repairing other lines in the city. It is understood that the foreign offer is £1,700 lower than any other.

A new railway, affording communication between Plymouth and Yealmpton, was formally opened on Saturday. The line, which has been made by the Great Western Company, commences at Plymstock at the termination of the old Plymstock branch, and extends to Yealmpton, a distance of 6½ miles, the total distance from Plymouth to Yealmpton being 9½ miles. The line is single throughout, the ruling gradient being 1 in 60, and the sharpest curve having a radius of 15 chains. There are five stations—Billacombe, Elburton Cross, Brixton-road, Steer Point, and Yealmpton—all, with the exception of Elburton, having goods in addition to passenger accommodation. The railway has been constructed from plans by Mr. J. C. Inglis, chief engineer to the Great Western Company.

The extension of the town hall was considered by the town council of Newport, Mon., on Tuesday. The town hall now stands nearly in the centre of a block of business buildings bounded by Corn-street on the eastern side and by Austin Friars on the south-western side. At the rear on the latter side the present buildings of the town hall abut on Austin Friars and Dock-street. There is little more space to be obtained on that side, and finding that additional rooms and offices are needed, it has been determined to extend the town hall on the eastern side, in the direction of Corn-street. The premises, lately occupied by a grocer and stationer, have been secured at a cost of £20,305. The cost of removing present buildings and erecting the extensions will probably run into another £15,000 or £20,000.

COMPETITIONS.

BRISTOL.—A competition has been recently held in connection with the proposed Horfield Wesleyan chapel and schools, and at a meeting of the trustees, held on the 15th inst., the designs submitted by Messrs. La Trobe and Weston, 20, Clare-street, Bristol, were selected.

CARLISLE.—In the competition for a new board school in this city, Mr. E. R. Robson, F.S.A., of London, was appointed to advise the board, and on his report the first premium of £20 has been awarded to Mr. Rushworth, of Croydon (under motto "Red Circle"), and the second premium of £10 to Mr. Bottomley, of Middlesbrough (under motto "99"). Forty-five sets of plans were sent in, and the seven undermentioned were selected by Mr. Robson, and placed in order of merit as follows:—(1) "Red Circle," W. Rushworth, Croydon; (2) "99," J. M. Bottomley, Middlesbrough; (3) "Strength and Grace," H. P. Burke-Downing, Westminster; (4) "Holme," Stephen Piper, Newcastle-on-Tyne; (5) "Light and Air!" (3), Hunter, Crawford, and Carfrae, Edinburgh; (6) "Knowledge," W. Y. Hobbiss, Southend-on-Sea; and (7) "Plan," S. Jackson, Fenchurch-street, London, E.C.

COLNE, LANCS.—In the competition for a new board school, Mr. W. A. Royle, of Manchester, the assessor, has awarded the first premium of £20 to Mr. W. H. Atkinson, of Colne, and the second of £10 to Mr. John Varley, of the same town. The design of Mr. H. Holgate, also of Colne, was placed third, and it is stated that the last-named competitor has been appointed architect for the schools.

FYLDE UNION.—Sixteen sets of plans have been received in this competition for new workhouse and offices, and the guardians have appointed a F.R.I.B.A. as assessor, who is now giving the matter his attention.

MORECAMBE.—At a special meeting of the urban district council, held on the 14th inst., the twelve competitive schemes for the sewerage of the district were again considered, and eventually one submitted by "Forward" was adopted. This scheme will serve for a population of 60,000, including Bare and Torrisholme. The estimated cost of the works is £39,227 10s. 9d. (exclusive of wayleaves, engineering, or land), with an estimated annual working expenditure of £620 2s. 6d. for a population of £45,000. To this must be added the cost of the "septic system," which was agreed to at the last meeting, and which will form a part of the scheme. The successful competitor is Mr. H. B. Nichol, C.E., of Birmingham. The cost of the schemes submitted varied from £19,000 to £66,000.

WESTBURY.—Mr. Edward Gabriel (Edmeston and Gabriel), the assessor appointed by the committee of the Westbury-on-Trym National Schools, Gloucestershire, in connection with the recent limited competition for new schools, has placed the design submitted by Mr. W. L. Bernard first, and that of Mr. Hy. Hirst second, in order of merit, and the selection has been confirmed by the committee.

The senate of Cambridge University on Saturday re-elected Mr. W. Ridgeway, M.A., of Gonville and Caius College, to the Disney Professorship of Archæology.

The new parochial hall adjoining St. Matthew's Church, Bootle, was opened on Friday by Miss Ryle, daughter of the Bishop of Liverpool. The plans were drawn out originally by Mr. Charles Aldridge, F.R.I.B.A., who, however, did not live to see the work commenced. Its prosecution has been intrusted to his son, Mr. Ernest Aldridge, under the superintendence of Messrs. Willink and Thicknesse, of 14, Castle-street, Liverpool. The contractors for the whole work are Messrs. George Woods and Son. The cost has been £2,400.

The Court of Appeal in Dublin gave judgment on Friday in the case in which a syndicate of gentlemen sought to establish their right to inclose the Giants' Causeway, and deprive the public of free access to it. The syndicate alleged that they were entitled to exercise the right which they claimed under a lease which they had obtained from Mr. Hugh Lecky, the owner of the property within which the Causeway is situated. When the case came before the Vice-Chancellor he declared the plaintiffs entitled to the Causeway and the lands comprised in the lease. The Court of Appeal now confirmed the decision as regards the Causeway, but decided that the road leading to the Causeway was a public road, over which the public had a right of way.

Building Intelligence.

NEWTON ABBOT.—Lady Clifford opened on Friday the new Union Infirmary at Newton Abbot. It is erected on high ground at the rear of the workhouse. It comprises a central block, in which are twelve rooms, 17ft. by 14ft., nurses' day rooms, &c., and two wings with wards, 62ft. long by 24ft. wide. All are 11ft. high. At the rear, connected by covered ways, is another building, including three lying-in wards and five bedrooms for the nurses. Two of the lying-in wards are 22ft. by 22ft., and the other 15ft. square. The infirmary, which will accommodate 120 patients, has cost nearly £10,000. The architect was Mr. S. Segar.

CHIPS.

We are glad to hear that the corporation of Bootle have acceded to the representations of the Liverpool Master Builders' Association, on which we animadverted in our last issue, p. 79, and have withdrawn the objectionable clause in their advertisement for tenders for a new lodge at Derby Park, demanding that "persons tendering must submit their own schedule of quantities fully priced out, which must accompany the tender."

The Bishop of Oxford opened on Friday the Linton Memorial Schools, which have been erected in the parish of St. Peter-le-Bailey, Oxford, on a portion of the site of the old New Inn Hall, at a cost of nearly £4,000.

On Saturday, at Wolverhampton, Mr. George Armstrong, who lately retired after holding the position of superintendent of the northern division of the Great Western Railway system for many years, was presented with a number of gifts of the value of about £200, subscribed for by his colleagues and friends.

A new organ in Cotham Wesleyan Chapel, Bristol, built by Mr. W. G. Voules, of that city, was opened on Saturday. It is built in two parts, one being placed on either side of the organ chamber. The case was designed by the architects of the building, Messrs. Curwen and Jones, and the work has been carried out by Messrs. Stephens and Bastow, also of Bristol.

Mr. Philip E. Pilditch has been appointed as one of the surveyors and umpires to the Board of Trade.

The Primitive Methodist Chapel in West-street, Boston, Lincolnshire, which was destroyed by fire on January 28th, 1897, and has been rebuilt and renovated at a cost of about £2,000, was reopened on Friday. The architects were Messrs. Howdill, of Leeds.

The City and Waterloo Railway, which will give the London and South-Western Railway direct access from the Waterloo terminus to the heart of the city, will shortly be opened for traffic. The line itself was completed some time ago; but delay has occurred both by reason of the dispute in the engineering trade, and also in connection with the underground work which has had to be undertaken by the central London Railway Company at the new station opposite the Mansion House.

Archdeacon Sinclair appeals for £3,800, the balance still required of a sum of £5,000 for restoring the parish church of Bow, E. This parish church, one of the oldest in London, has been from time to time patched and repaired; but is now pronounced unsafe by Sir Arthur Blomfield, and has been closed during the last 16 months. In September, 1896, the roof of the chancel fell in. The original structure, although tottering to decay, still remains a correct specimen of the architecture of the early part of the 14th century, and, as Dr. Sinclair remarks, the tower forms a noble object in the middle of Bow-road, the whole length of which it dominates.

The city council of Liverpool have decided to purchase the Harbreck Estate at Fazakerley as a site for a proposed fever and small-pox hospital. The estate comprises an area of 113 acres, and the price to be paid is £37,150.

At Friday's meeting of the West Riding County Council, the general asylums committee reported that the plans for an asylum for private patients, to be erected at Scalebor Park, Burley, had received the provisional approval of the Lunacy Commissioners. Accommodation was provided for 210 patients (105 males and 105 females). The plans did not include the villa residences for the higher class paying patients, nor a chapel. The committee was empowered to erect an asylum at an estimated cost of £80,926. It was also agreed that works for the centralisation of the heating station and an installation for the supply of electric light at the West Riding Asylum at Wakefield should be carried out at an estimated cost of £16,000.

LEGAL INTELLIGENCE.

CONVERSION OF PRIVIES INTO THE WATER CARRIAGE SYSTEM AT ECCLES.—In October last, at Eccles Petty Sessions, William Barnett, summoned by the corporation of Eccles, was ordered to abate the nuisance alleged to be caused by the defective ashpits and middens at the back of property belonging to him in Ellesmere-street, Patricroft, and to substitute in place of the ashpits water-closets, and covered dry receptacles for the dry ash tubs emptied by the corporation scavengers weekly. Mr. Barnett appealed against the decision of the borough magistrates, and the appeal was heard on Wednesday at the Salford Hundred Sessions held at the Assize Court. Mr. Goldthorpe, stipendiary, presided. Mr. Langdon and Mr. Pope, jun., appeared for the appellant, and Mr. Rhodes appeared for the corporation. After a hearing lasting over five hours, the Court dismissed the case, with costs against the appellant.

THE BUILDING OF A WORKHOUSE: DREW-BEAR AND OTHERS V. THE ST. PANCRAS GUARDIANS.—In continuation of our report last week, pages 77-8, we give to-day a brief summary of the proceedings on the last two days' hearing of this protracted arbitration case, which was heard by Mr. Justice Ridley, sitting without a jury, from Tuesday till Saturday last. The total claim from the defendant guardians was for £16,872, damages alleged to be due to plaintiffs as trustees for the builder of St. Pancras Workhouse, for not being able to obtain full possession of the site within six months of the date of the contract, and for interference by sub-contractors. Mr. R. M. Bray, Q.C., and Mr. A. A. Hudson represented the plaintiffs, and Mr. English Harrison, Q.C., and Mr. W. Moyses appeared for the defendants. William Henry Thurgood, F.S.I., of Great George-street, Westminster, said he had practised for 18 years past as a surveyor, and prior to that was a builder in an extensive way of business for many years. In April, 1893, he was called on to measure up the work at St. Pancras Workhouse for the plaintiffs, as the trustees of Brooks. He considered the charge made for loss resulting from the piece-meal possession given to plaintiffs was fair, having regard to the increased expenses thereby involved. He estimated the extra outlay under that head at, in the least, 12½ per cent. on the contract sum. Harry W. D. Theobald, F.S.I., 110, Great Russell-street, Bloomsbury, said he had acted as manager both to H.M. Office of Works and the War Office, and was the arbitrator selected by Kirk and Randall and the St. Pancras Board of Guardians in respect of the dispute between them as to the original contract for the workhouse, which, after Kirk and Randall withdrew therefrom, was taken over by Brooks. He regarded 12½ per cent. as a fair allowance for the delay in gaining possession, and for interference by such contractors. Cross-examined: Interference to the works was caused by ambulances and coal-trucks going backwards and forwards to the workhouse. William Henry Strudwick, F.S.I., late of 14, Parliament-street, S.W., now of New Inn Chambers, said he had been practising as a surveyor for 35 years. He agreed with the last two witnesses that 12½ per cent. was a fair addition to make to the contract price for the delay and interference. This closed the plaintiff's case. For the defence, A. Boden was called, and said he was chairman of the Building Committee of the St. Pancras Board of Guardians at the time the operations in question were being carried out, and he saw, from time to time, all the works during their execution. From first to last, during the carrying out of the contract, the witness Fearon, Brooks's manager and son-in-law, did not apply to him to be allowed to make an entrance between block H and the end of block A. The learned Judge remarked that clearly this was a matter for the architect, who gave the contractor one entrance instead of another. Witness, proceeding, said he never at any time gave Fearon an order to repair either of the two roads. Fearon never made any complaint to him that the roads were being used by the guardians. Alfred A. Millward, clerk to the St. Pancras Board of Guardians, said he never gave orders for the repair of the two roads, and never allowed any of the guardian's traffic to pass over either of those roads. If traffic did pass over them, it was contrary to his regulations. Captain Thomas Miller, the master of the workhouse, deposed that no traffic for the guardians passed over either of the two roads that had been mentioned while the contract was being executed. J. G. Deane said he acted as gatekeeper at the workhouse during the entire period that the inside works were being carried out. He kept a book recording all the carts and vans passing through the gates, and this showed no entry of a vehicle on the vestry's business going through. Heavy traffic was unloaded at the Commercial-street entrance, and the lighter goods at the receiving ward entrance. His lodge was close to the Vestry Hall, and his duty was to remain at his post all day. He did not remember Fearon calling his attention to carts coming in at the vestry entrance. William A. McCormick said he was a builder in the Essex-road, and from his books he said there was no appreciable rise in the price of building materials in 1893. His Lordship: The suggestion is that the rise in prices took place in 1892. Mr. English Harrison thought the evidence rather tended the other way. The chief items in the contract were bricks and timber. Witness added that he had examined the invoices in his business for the purpose of ascertaining whether there was a rise in the price of bricks and timber in 1892. At the end of 1892 he could not detect any appreciable advance; but since 1895 there had been large strides. This closed the evidence for the defendants, and Mr. English Harrison addressed his lordship on behalf of the board of guardians, Mr. Bray replying on behalf of plaintiffs. At the conclusion of the legal arguments, his lordship said he would like a few days to consider the matter, and would give due notice to both sides as to when he would be able to pronounce his decision. Judgment accordingly reserved.

RE ATHERTON AND DOLMAN.—The bankrupts were builders trading at Poplar, and a sitting for their public examination was held last week. The joint accounts showed liabilities amounting to £13,752, of which £10,852 were unsecured, and assets £4,255. The failure was ascribed to losses on contracts and depreciation in the value of the stock, plant, &c., as estimated for realisation. Mr. Hough appeared as Official Receiver, and Mr. Buckmaster for the trustee. The examination was concluded.

WATER SUPPLY AND SANITARY MATTERS.

THE LONDON WATER SUPPLY.—The Royal Commission inquiry into this subject resumed its sittings on Monday at the House of Lords. Sir A. R. Binnie, chief engineer to the London County Council, gave statistics as to the population and rate of increase in inner and greater London, and the areas served by the nine water companies. The water supply was mainly derived from the rivers Thames and Lea, springs and wells in the Lea valley and wells in Kent. The witness quoted figures to show how nearly there might be an approach to the absorption of the whole flow of the Thames during comparatively long periods in the drier half of the year, and that the whole flow of the river Lea was practically absorbed in dry weather. The Lea Conservators afforded no protection to the public, because they were entirely overshadowed by the water companies. The witness referred to the bitter complaints which had reached the London County Council as to the shocking state of the Lea. He did not altogether accept the finding of Lord Balfour's Commission that the Thames and Lea were satisfactory sources of supply, and held it to be expedient that a portion of the supply should come from some other source. He would not abandon the present sources of supply, but would supplement them. Continuing his evidence on Tuesday, Sir A. Binnie said he was of opinion that the existing supply would have to be supplemented in ten or fifteen years, and was in favour of obtaining an additional supply from Wales, at a first outlay of over £14,000,000, and an ultimate expenditure of £26,000,000. The Commission adjourned till Monday.

The death is announced of Mr. Thomas D. Ridley, J.P., dock and railway contractor, Middlesbrough, which occurred at his residence, Willimoteswick Villa, Coatham, on Friday, at the age of 73. Mr. Ridley has lived at Redcar for over a quarter of a century. He was formerly a member of the Kirkleatham Local Board, and for some time its chairman.

Mr. F. H. Tulloch held an inquiry at Menai Bridge on Friday touching an application made to the Board of Trade by the urban district council to grant a provisional order for the erection of a pier and pavilion and other works. Mr. Webster, C.E., of London, the engineer, whose design was adopted in open competition, explained that the pier would extend seawards in a southerly direction for a distance of 320ft., commencing at the east end of St. George's-road. He estimated the cost at £3,000, inclusive of the erection of a warehouse and waiting-room.

New offices for the West Ham School Board, which have been erected in The Grove, Stratford, were opened on Friday. The building has been erected from plans by Mr. W. Jacques, the architect to the board, and has cost, exclusive of the electric light installation, close on £14,000. The principal apartment is the board-room, 35ft. by 40ft. It has a low octagonal dome, each of the eight sides of which is fitted with a semi-elliptical window glazed with coloured glass. The members will be seated at separate desks arranged in a semi-circle in front of a dais for the chairman and principal officers. The floors throughout, and the greater part of the roof, are of steel and concrete, the paving of the corridors being of mosaic.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Correspondence.

"A PARALLEL TO WALTHAMSTOW."

To the Editor of the BUILDING NEWS.

SIR,—I have received from Messrs. Wontner and Sons (solicitors to Messrs. Spalding and Cross) a communication complaining, on behalf of their clients, of my letters on this subject in the BUILDING NEWS. The essential part of this communication is given in my reply to it, which I shall be glad if you will publish below.—I am, &c., JAMES CUBITT.

2, Broad-street Buildings, E.C.

To Messrs. Wontner and Sons.

GENTLEMEN,—I have to acknowledge the receipt of your letter of the 14th inst., complaining, on behalf of Messrs. Spalding and Cross, of two letters of mine in the BUILDING NEWS, and specifically of certain remarks in the first of these, which was published on December 17, 1897.

You say that in this letter I "commence by stating that 'it is the duty of every honest man to aid in letting daylight into the dark and dirty corners of architectural practices' [*sic*], and as an example of these 'dark and dirty practices,'" that I "then proceed to quote certain doings of Messrs. Spalding and Cross" This complaint is entirely based on a serious, though doubtless inadvertent, misquotation of my words, which alters their meaning, and puts an erroneous construction on my whole letter.

I made no mention whatever of "practices." What I wrote about was *architectural practice*; and I meant by this phrase what it usually does mean - namely, architectural business, and the conduct of architectural matters, whether by architects or by the multitude of other persons who at one time or another have to do with them. It is with the architectural practice of these other persons, in appointing and removing architects, that my letter of December 17 mainly deals; and this is evident, even in the very next words which follow those you have quoted. I have never described any "doings" of Messrs. Spalding and Cross as "dark and dirty practices," and it is only through the serious misquotation which I have pointed out that it becomes possible to make it appear I have done so.—I am, gentlemen, your obedient servant, JAMES CUBITT.

P.S.—As Messrs. Spalding and Cross thought well to announce in the last issue of the BUILDING NEWS that they had placed this matter in your hands, I am sending a copy of this letter to that journal for publication.—J. CUBITT.

WALTHAMSTOW PUBLIC BATHS.

SIR,—I think it is grossly unfair on the part of Messrs. Spalding and Cross to charge me with publishing "misleading and untrue statements" without supplying cases in confirmation thereof.

The quibble as to whether the £25 or guineas they received was accurately described as a "second premium" when there were only two competitors, requires no further comment.

Have they returned the money?

On looking over the correspondence, I find that many of my statements are supported by independent and reliable evidence, and in other cases I have asked Messrs. Spalding and Cross for the truth, and with what result?—they have deliberately ignored my requests.

To charge me with making "misleading and untrue statements" under such circumstances is simply scandalous.

Now, what is the reason which has induced Messrs. Spalding and Cross to reappear in this matter after deliberately stating that they could not continue the correspondence? It is not far to seek. I venture to submit that, having failed to justify their position from a professional point of view, they have unwittingly rendered it exceedingly difficult for their special pleader to justify his position at the forthcoming District Council election. The influence of this correspondence has been making itself felt in the district, and consequently we find Messrs. Spalding and Cross now being made the mouthpiece of the views of their special pleader, whose action has been so severely commented upon. I have nothing to suppress, and therefore will subject their one-sided semi-official statement, *based, not on the action of the Council, but on the action of Committees*, to as close an analysis as I hope I have hitherto treated their unofficial observations.

(1) Messrs. Spalding and Cross say that, "long before Mr. Dunford's name was suggested in connection with the proposed work, we were practically engaged by the council to prepare the necessary working drawings for the baths." You have already been informed how Mr. Spalding first came before the council, and, as the story has not been denied, but simply described as "inaccurate," it will bear repeating:—

"A member of a firm of architects hearing, quite by accident (of course), that baths were to be constructed at Walthamstow, armed himself with plans, came down to Walthamstow, and, by the merest chance, called upon one of the rank and file of the council, who was a perfect stranger to him; called, too, on the very night that the works committee were to meet, and through this 'chance' visit secured an interview that very night."

The *Walthamstow Guardian* (Dec. 10, 1897), commenting upon this, says: "How very pretty; how entirely probable. Tell it to the marines, or to the youngest children in an infant-school, and just possibly it might be taken in."

Once again I ask for the truth. The statement that they were "practically engaged" has been made before, and answered as follows at a council meeting:—

Mr. McSheedy: They had practically appointed Messrs. Spalding and Cross eighteen months ago ("He was invited into the Committee, and picture-plans were submitted, which were so elaborate that the Committee actually appointed him."—*Herald* report.)

Mr. Good: I should like to see the resolution appointing them.

Mr. McSheedy: I say we had practically got to the appointment of these gentlemen.

Mr. Good: No.

Mr. Ogilvie: It was not true that Messrs. Spalding and Cross were appointed eighteen months ago. They never had been appointed.

Mr. Finch: You say you had practically appointed Messrs. Spalding and Cross, Mr. Spalding being introduced by Mr. McSheedy; but they never were appointed. —*Guardian* report, Nov. 19, 1897.

I believe it is perfectly true that the clerk to the council was instructed to write to the various public bodies for whom Messrs. Spalding and Cross had erected baths to ascertain what were the orignal estimated costs, and what was the final expenditure incurred, and I believe it is also perfectly true that the following statement was made at a council meeting:—

"It was admitted that the baths and washhouses erected in various parts of the country by Messrs. Spalding and Cross had not, in several cases, been carried out for the sum named."—*Guardian*, April 9, 1897.

Whether this statement is correct or not I cannot say; but on receipt of the figures, when Mr. Spalding's friends were in a minority, they clamoured loudly and publicly for their publication. Since reaching the position of a majority they have displayed a curious and interesting reticence in connection therewith.

Messrs. Spalding and Cross appear to imagine, in conjunction with their special pleader, that the above instruction to the clerk ("They thought it a *bonâ fide* suggestion . . . so they voted for it." —Mr. McSheedy) was merely an electioneering move.

When did this view of the case first dawn upon them? Was it after the reception of Mr. Plumbe's report?

Although builders as a rule are not averse to extras in their own business, you will generally find that on public bodies they are very severe on architects in this respect. The suggestion to apply to other authorities for information—emanating as it apparently did from gentlemen engaged in the building trade—does not surprise me, and certainly does not strike me as an electioneering move. However, let Mr. Spalding ask the gentleman who moved the resolution. He will have an early opportunity.

(2) It is true that after Mr. Plumbe's report was received it was decided in committee—no doubt with the object of satisfying the importunity of the special pleader—to ask Messrs. Spalding and Cross to appear before the next committee to pledge themselves to erect the baths for the sum named! The actual date of this meeting I do not know, but it must have been early in February (1897), and about the time of the Walthamstow Parliamentary Election. At this period the following telegram was published (Feb. 5):—"To J. J. McSheedy. Hearty congratulations on your (!) brilliant victory. Spalding." Did this telegram refer to the election, or did it refer to the victory gained in committee? However, telegram or no telegram, the majority altered their views before the council meeting. (Is it an unheard-of arrangement for a council to upset a clause in a committee's report?) The reasons were set forth at the time in a letter which appeared in the *Guardian* (March 5), and from which I take the following extract:—

At the special committee a prominent member of the opposition said there was no hurry for the baths. Note. —*Mr. Spalding's "chance" visit was eighteen months before.*) In my opinion time enough has been wasted; obstruction has been well kept up, and now the prominent member, if I understand him, wishes to put the matter off, so that he may at election time misrepresent, and make it appear that the members on the other side have caused the delay.

Here we have direct evidence that Mr. Spalding's special pleader was endeavouring to bring about what they now complain (without the slightest justification) the other side did twelve months before—viz., to delay the selection of the architect until after the election.

I "do not know to what extent the machinations on the part of their principal supporter were approved or instigated" by Messrs. Spalding and Cross; but I "do know that they were prepared to benefit by the results calculated to be achieved."

(3) Messrs. Spalding and Cross further say:—"The third council at once rescinded the resolution carrying Mr. Dunford's appointment on the ground that it was obtained by a 'gross act of jobbery.'" I think it must be impossible for anyone who has carefully read the foregoing to avoid drawing the conclusion that Messrs. Spalding and Cross must have sunk very low indeed to prefer in your columns such a rash and hasty charge.

I venture to say that it is a deliberate insult not only to Mr. Rowland Plumbe, but to every member of the Council who has confirmed that gentleman's decision.

What evidence have they cited in support of this charge?

(1) That the minority of the 1895 Council declined to take Messrs. Spalding and Cross at their own or at the valuation of their special pleader.

Has it come to this:—that one man out of twenty-two is to be allowed to select the architect of a public institution, and if he is not allowed to have his way, that the majority of his colleagues are to be described through his nominee as "jobbers."

(2) That the majority of the 1896 council refused to allow Messrs. Spalding and Cross to appear before them to state how they were going

to carry out their scheme for £7,000! Since raised on their appointment to £8,500). I have no authority to defend the action of any particular section of the council, and, therefore, in dealing with this matter, shall chiefly confine myself to recorded evidence.

I shall submit that they were perfectly justified, apart from the approaching election, as explained above, for two reasons. First, they had already paid a heavy fee to Mr. Plumbe to advise them on the point, and he said it could not be done for anything like the money. Secondly, they had within their own ranks gentlemen possessing experience of the building trade who were quite able to gauge the fact for themselves: as will be seen from the following dialogue which took place at council meetings:—

Mr. Good: As a builder of many years' standing, said, *when they referred the plans to Mr. Plumbe, they agreed to abide by that gentleman's decision* as to plans for carrying out the work as near £7,000 as possible. Mr. Plumbe said in his report that Mr. Dunford's plans were best for the price, although those of Messrs. Spalding and Cross were better in other respects. He was afraid the latter firm had not considered the cost in preparing their plans. He went on to say that the plans of Spalding and Cross must involve a much heavier outlay.

Mr. Ogilvie: As a builder with over 40 years' experience, he had no hesitation in saying that the plans prepared by Messrs. Spalding and Cross could not be carried out for anything like £7,000. They had gone in for what he believed would be an expensive building. If they had plenty of money to spare, and could spend £12,000, he would support them in putting the matter back, *for no doubt Mr. Dunford could give them a very different building for that amount.* Mr. Dunford's plans had first place, and he should support sealing the contract.—*Guardian*, April 9, 1897.

Mr. Finch: If I had done in the case of Mr. Dunford what had been done in the other case, no doubt insinuations would have been made; but I make none against Mr. McSheedy. He says we have been guilty of trickery, and I say, if we had done what he has done with Messrs. Spalding and Cross there might be some foundation for it, but we have not done such a thing, and I have never discussed with Mr. Dunford the subject of the plans. Messrs. Spalding and Cross were said to be rattling good men, and no doubt they were; but they did not keep within the margin, and the arbitrator said their plans were not economical. Mr. Dunford did endeavour to keep to the price, and it was unfair to say there was jobbery. It was not right, honest, or fair, and it was immoral to rescind the appointment.—*Guardian*, Nov. 19, 1897.

The *Guardian* of the same date says, in the course of a leading article, "there is not a shadow of foundation for the accusations of trickery and jobbery made with reference to Mr. Dunford's appointment." *In the face of these facts will Messrs. Spalding and Cross repeat their charge?*

These gentlemen are anxious to know who said their design was placed second. The following is a copy of the official resolution. "That in accordance with the award of Mr. Rowland Plumbe, the author of the design under motto 'Hygiene' be appointed architect for the public baths, subject to the drawings being approved by the Local Government Board, and that the agreed sum of £25 be paid to the author of the design placed second under the motto 'Experience.'"

I have examined the article referred to by Messrs. Spalding and Cross in a local sheet edited by the special pleader, and find, first, that Messrs. Spalding and Cross's letter now under consideration incorporates all its salient points; and, secondly, that the letter and article are similarly constructed, thereby raising inferences of an obvious character.

In conclusion, permit me to say that I have had no communication whatever with any member of the late or present council as to the interpretation to be placed upon the acts of committees in contradistinction to the judgment of the late council.—I am, &c.,

J. WILLIAMS DUNFORD.

100c, Queen Victoria-street, E.C.

THE CARDIFF COMPETITION.

SIR,—Mr. Waterhouse's silence in regard to my charge of remissness in checking the cubic contents may be discreet, but is not what we, as competitors, are entitled to. Surely, if the profession rely on Mr. Waterhouse's judgment, they are entitled to some justification of his action in this matter.

I, for one, am not disposed to let the matter rest, having had to suffer once from a parallel case. Hence, I have had the cubic contents of the first and second prize designs carefully measured. The result is as follows:—

FIRST PRIZE DESIGN.

Town Hall, 3,066,935ft., at 11d.	£137,817 17 1
Law Courts, 2,334,750ft., at 10½d.	102,145 6 3
	£239,963 3 4

SECOND PRIZE DESIGN.

Town Hall, 2,991,396ft. at 11¾d.	£146,459 12 9
Law Courts, 1,947,475ft., at 11d.	89,259 5 5
Basement of Town Hall (not shown on published drawings), say	5,000 0 0
	£240,718 18 2

NOTE.—The prices per cubic foot are competitors' own figures.

Outside the important question of ignoring the conditions (and you are entitled to our thanks for the trenchant remarks *re* this in this week's leading article, p. 51 *ante*), the profession is entitled to have the matter of exceeding the cost cleared up. It is time a stand was made when a miscarriage of justice like this takes place, and I hope Mr. Waterhouse for his own credit's sake will not let the matter rest where it is, but "do justice, though the heavens fall."—I am, &c.,

NEMO.

Intercommunication.

QUESTIONS.

[11884.]—**"Red" and "Yellow" Deal.**—Will a practical reader define these terms, and how they can be distinguished? Textbooks leave the student hopelessly in the dark: they merely distinguish the tree and the general uses, but give no information as to which kind is to be used for any particular sort of work. The Latin or botanical name for each of these building designations ought to be made clear, and I am glad that D. Forbes-Smith, in a letter in last week's "B.N.," has called attention to the subject. All architects would rejoice to see a better classification.—A LEARNER.

[11885.]—**Foreign Slates.**—What are the kinds of slates imported from America and other countries? Are they reliable and non-porous? I shall be glad of any information and prices.—COUNTRY BUILDER.

REPLIES.

[11882.]—**Brickwork Facing Measurement.**—Facings are measured as extra per foot super. on the common brickwork. It is usual to take the gables by the width and half the height. The reveals of windows are measured the whole depth. For gauged walls, the face and soffit. There is an example given in Leaning's "Quantity Surveying." It is customary to deduct any facings of the stock brickwork, and then measure the facings if of red brick.—G. H.

[11882.]—**Brickwork Facing Measurement.**—Collect the lengths of walling from plan, and put the total down as one dimension, and under it the height to, say, plate level. This will make one sum for the round of walls up to the gables. Then take the gables separately, height by width, and halve it in each case, and these sums are added. Describe the bricks, pointing, &c. It is best to take the gables separately, so as to be able to dissect the work if necessary.—A SURVEYOR.

At Friday's meeting of the Salford Board of Guardians, the building committee recommended the board to authorise them to make an offer of £14,000 for a plot of land at Hope, containing about twenty acres, adjoining land already in possession of the guardians, as the site for the proposed new workhouse for the union. The recommendation was adopted after a discussion.

The new operation rooms at the North Staffordshire Infirmary, at Stoke-on-Trent, were formally opened last week. All the old fittings are replaced by suites, wash-basins, and shelves made specially by Messrs. Twyford's, Limited, the flooring being of terrazza, and the walls of specially-made tiles by Messrs. Wedgwood and Sons. The alterations have been carried out by Mr. T. Goodwin, builder, from the designs of Messrs. Lynam, Beckett, and Lynam, of Stoke-on-Trent, at an estimated cost of £1,000.

At the last meeting of the St. Olave's Guardians, ten tenders were opened for the erection of a new workhouse at Ladywell, Catford. The building is to accommodate 800 persons, and the architects' estimate was £156,000. The successful firm were Messrs. Shiltitoe, of Bury St. Edmunds, whose tender was £158,785. A motion by Mr. Collins that the work should be confined to London firms was negatived; but a resolution was adopted requesting Messrs. Shillitoe to give consideration to the claims of London workmen, and especially to residents in St. Olave's Union.

Mr. J. Loughborough Pearson, R.A., of 13, Mansfield-street, who died on the 11th ult., leaving personal estate of the value of £51,943, left a will dated July 6, 1875. The sole executor of his will is his son, Mr. Frank L. Pearson, architect. The testator bequeathed to his valued and faithful assistant, John Codd, £300, and expressed the hope that his son would avail himself of the services of the said John Codd. Mr. Pearson directs his son, within six months after the testator's death, to purchase two annuities of £60 each, one for the testator's sister Sarah, widow of Mr. Huttman, of Amsterdam, and one for his sister-in-law, Sarah Christian. He gives the entire residue of his estate to his said son absolutely.

Our Office Table.

THE result of the elections at the Royal Academy on Wednesday evening is that Mr. George Aitchison, who, since Mr. G. E. Street's death in January, 1882, has been the Professor of Architecture at the Academy Schools, and is now serving a second year of office as President of the Royal Institute of British Architects, is advanced from the rank of Associate to full Academician, thus taking the seat among the forty held since 1880 by Mr. Pearson. Professor Aitchison was elected as an A.R.A. nearly seventeen years ago, and, as the *Standard* says, as "an architect had to be chosen to the higher grade of the Academy, there was no reason to refuse him the distinction, though his claims may scarcely be said to have called loudly for it." The second associate promoted to full honours is Mr. Edward John Gregory, landscape and portrait painter, a brilliant colourist. Popular opinion had anticipated that the choice would fall on Mr. B. Williams Leader, who, like Mr. Gregory, became an associate in 1883; but his turn will probably come next month when two other academicians and an associate are to be chosen. The new associates are both *genre* painters—Mr. Lionel P. Smythe and Mr. H. H. La Thangue.

A LECTURE on "Composition in Architectural Studies" was delivered before the Edinburgh Photographic Society on Friday by Mr. Hippolyte J. Blanc, R.S.A., architect; and by a coincidence Mr. F. T. Baggallay was at the same hour dealing with the topic of Composition in Architecture, regarded, however, from the view point of the designer, and not that of the photographer, before the members of the London Architectural Association, as fully reported on another page of our issue. Mr. James Patrick, the president of the society, occupied the chair. At the outset Mr. Blanc suggested a definition of composition to show the different conditions under which composition has to be considered by the painter, the sculptor, and the architect. The painter worked upon a surface of canvas which he could alter and treat according to his will, but which, when done, did not change. The sculptor did his work, like the architect, in his studio, but when brought out to the light of day and put in position, not one aspect of it only was viewed, but it was surveyed from all sides, and therefore, he said, the architect and the sculptor had to make their compositions pleasing from many points of view. He pointed out that the photographer of architectural studies was under the same disadvantage in that the group photographer could pose his subject in front of his camera, but the architectural photographer had to bring his camera round and round his building or group of buildings until he found out the best position from which he could obtain the most satisfactory picture.

DURING the demolition of St. Michael's Church, Wood-street, Cheapside, a small window, consisting of three quatrefoil lights arranged in a triangle, was discovered in the south wall. This, with some fragments of stained glass, exhibiting delicate tracery and foliate designs, some encaustic tiles, with cream-coloured patterns upon a red ground, and portions of an early stone coffin, have been secured for the Guildhall Museum. These remains date from about the 14th century, the window having probably been built up when the church, which suffered during the Great Fire, was re-erected by Sir Christopher Wren in 1673. The Old Bell Inn, Holborn, one of the last of the galleried hostelries, has also contributed a relic to the museum. It is a sculptured stone, bearing the arms of the Fowlers of Islington, who probably once owned the property. Other objects recently acquired for the museum include a little Roman scent-bottle, of a rare type, from Ivy-lane, Newgate; a tiny olla, decorated with raised bosses; a group of 17th-century pewter and pottery, from Great Chapel-street, Oxford-street; and several examples of pottery and glass, tobacco pipes, keys, &c., from the various City excavations. The library committee of the Corporation have presented to them a report announcing the completion, in manuscript, of a catalogue of the antiquities in the Museum. The committee suggested that the catalogue should be printed on demy quarto paper, that one section should be published first with good illustrations, and that one-half of the edition of 1,000 copies should be placed on sale. With that

view they asked for £100 to print as large a portion of the catalogue as that sum would allow, reserving for a future report the question of printing a smaller edition of the catalogue, without illustrations. The question came before the Corporation last week, with the result that the report was referred back for reconsideration, with especial reference to the ultimate cost of the catalogue as a whole, and having regard to the fact that over £1,000 has already been spent in arranging and cataloguing the antiquities. At the same meeting £700 was voted for general repairs to the building of the Guildhall Library and a rearrangement of the reading-room.

THE secretary to the Edinburgh Building Trades Exchange, Mr. John Nicoll, has sent the following letter to the chairman of the committee of contributors to the Royal Infirmary in that city with reference to the tenders for the new pavilion:—"The committee of the Building Exchange consider it their duty to the public to draw attention to the large increase in the tenders accepted over others before the board. My committee consider that the excess is so great as to call for inquiry and explanation. For example, the accepted tenders for mason and joiner work are £18,628. One lower offer at least, from responsible and well-known contractors who have carried out extensive works in this city and all over Scotland, was £17,008—excess, £1,620. Plumber—accepted, £3,188; rejected, £2,925—excess, £263. And there is a prevalent belief that the tenders for other work have been dealt with in the same manner. It is conceded that there was no obligation on the board to accept the lowest offers, but, on the other hand, when the funds involved relate to the building of a public charity, it is obvious that such exceptionally high offers should not be accepted without explanation, of which none has been vouchsafed. The difference in money is a serious matter, both to the institution and to the public. Moreover, there is no use inviting competitive offers if lower offerers of equal, if not better, business standing than higher offerers are rejected, and the higher offerers accepted according to the whim of the board for the time being, or of those having influence with it."

A FEW days ago some experiments took place on the No. 6 section of the Birmingham Waterworks Scheme at Rubery Hill (Mr. A. Kellett's contract). The whole of a hillock, and some 20ft. below the ground level, in close proximity to Rubery Station, had to be blasted for the purpose of concreting the bottom of the new reservoir now being constructed at Frankley Lodge. The problem to be solved was how to blast the rock (which is of a very flinty nature, lying in beds with partings of clay between) without dispersing the same over the line and station. Any of the nitro-glycerine explosives, such as dynamite, gelignite, &c., would have been too quick in their action, and were discarded. Mr. Thomas Johnson, of Dudley, assisted by the shotfirers, conducted the experiments. The explosive selected was "tonite," which requires no thawing in cold weather. It was the principal blasting agent used on the Manchester Ship Canal, Severn Tunnel, Mersey Tunnel, Barry Docks, and many other large contracts. The one side of the hillock having been "peppered" with holes these were charged with 1¼in. diameter 6oz. cartridges fitted with slow time fuses. These were lighted, and one after the other the whole of the charges exploded, simply lifting and toppling the stone and rubble down the hillside ready to be loaded up into trucks below, clearly demonstrating the slow action of the explosive. The experiments were, the *Birmingham Post* states, voted a thorough success.

THE sixth of the series of fortnightly lectures organised by the Glasgow Corporation on art subjects was delivered on Saturday evening, the lecturer being Mr. R. C. Graham, F.S.A., of Skipness, whose subject was "Notes on the Early Sculptures of Argyllshire." The chair was occupied by Bailie Shearer, chairman of the museums and galleries sub-committee. Mr. Graham referred to the well-known stones at Iona, and explained that they only form a portion of a very large collection, specimens of which still exist in most of the old Argyllshire churchyards. After showing what little interest was taken in this subject until about fifty years ago, the lecturer commented upon what had since been done by various writers in describing and illustrating a large number of specimens. Mr. Graham attributed the monuments to three periods, showing in turn Celtic, Scandinavian, and Lombardic influence. A series of slides was exhibited, beginning with examples of pre-Norman sculptures, including the great standing crosses of Kidalton, of Kilnave, and St. Martin's cross at Iona. An example was next shown of a small class of stones of a Norwegian character. Then followed specimens attributed to the 13th, 14th, and 15th centuries, showing effigies of ecclesiastics and warriors, &c. Examples were also given of stones remarkable for the beauty or variety of their design. Views of many of the later crosses followed, and in describing a panel on the Kilchoman cross, the lecturer explained how plaited work was elaborated from a simple series of parallel bands, and to show how this was done reconstructed the one in question on the black board.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. President's Address to Students. 8 p.m.
Surveyors' Institution. "Surveyors as Arbitrators," by A. A. Hudson. 8 p.m.
Liverpool Architectural Society. "Brass and Copper Work," by R. Ll. B. Rathbone.
Leeds and Yorkshire Architectural Society. "Ornamental Hand-Wrought Metalwork," by Nelson Dawson. 7.30 p.m.

TUESDAY.—Society of Arts. "Renaissance Woodwork in England," by J. Hungerford Pollen. 8 p.m.
Auctioneers' Institute. Conversazione.

WEDNESDAY.—Society of Arts. "Fireproof Construction of Buildings," by Thomas Potter. 8 p.m.

THURSDAY.—Society of Architects. "Accounts for Architects," by Calder Marshall, F.C.A. St. James's Hall, Piccadilly, W. 8 p.m.

The Society of Architects.

Founded 1884. Incorporated 1893.

The THIRD ORDINARY MEETING of the Society of Architects for the Session 1897-98 will be held at the Rooms of the Society, at St. James's Hall, Piccadilly, W., on THURSDAY, January 27th, 1898, at Eight p.m., when a Paper will be read by Mr. H. CALDER MARSHALL, F.C.A., entitled "ACCOUNTS FOR ARCHITECTS."

ELLIS MARSLAND, Hon. Sec.
MONTAGU BALDWIN, M.A., Sec.

Trade News.

WAGES MOVEMENTS.

BOLTON.—The plasterers of Bolton have just sent in an application for an advance in their wages by 1d. per hour and a reduction in their working hours from 52 to 49½ per week in the summer. They are now rated at 9d. per hour, and ask for 10d. They also request to be allowed to start work half an hour later each summer morning except Monday.

MANCHESTER.—As the result of an application by the members of the house painters' trade union in the Manchester district for an increase of wages, it has been agreed by the employers to make an advance of ½d. per hour above the present rate, to date from next May.

LIVERPOOL.—At the town-hall, on Friday, the Lord Mayor (Alderman Houlding), sitting as arbitrator, took evidence regarding the points which are now in dispute in the plastering trade—namely, the apprentice rule, the country rule, and the time for giving notice of alteration of rules. There were present on behalf of the Liverpool Master Builders' Association Messrs. Thomas Jones, Charles Tanner, Ben H. Johnson, Robert Johnson, R. Bromley Gardner, J. Cothliffe, and J. A. S. Hassall (secretary); while the representatives of the National Association of Operative Plasterers in attendance were Messrs. W. W. Jackson, J. Griffin, W. Morgan, Richard King, J. Crute, John Keuny, and W. Baldwin (secretary). The award of the arbitrator will be delivered at the earliest date.

Tullyallen—New Church	Rev. Thomas Taaffe, P.P.	William H. Byrne, M.R.I.A., Architect, 20, Suffolk-street, Dublin	,, 1

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2247.
FRIDAY, JANUARY 28, 1898.

INSTRUCTIONS TO ARCHITECTS.

AUTHORITY in matters of building is not recognised. Many people fancy they can order what they like, and in their own way; that it is easy to make a building of any shape and style they please. Conditions of life, of social surroundings, of site, and climate are things of no account to such people;—all they have to do is to give instructions as they would for a dress or a coat, and then expect a fitting and agreeable garment. It is hard to convince some people that what they order will not answer—in short, that their own ideas will not give the result they anticipate from them. The ordinary client is so inclined to take his ideas from what others have done—to imagine that because Mr. A's house in the country is so commodious and pleasant, the same results will follow in a town suburb. Because a particular disposition of rooms or offices is suitable in one place, it does not follow that it will suit in another locality where the site is different, the aspects of windows changed, or the requirements not the same. With style and decoration, it is precisely the same. Not everyone can decide for himself whether Greek, or Italian, or Georgian, or any other modern style is best for his purpose, as the question depends entirely on plan and position. Second-hand ideas here also prevail; it is fashionable, or *chic*, or what not to affect a particular period of craze, and the architect is forced to comply with the client's taste. Now, all this confusion and ignorance on questions of architecture or building arise from the non-recognition of authority in those who practise the art, and because, instead of facts and definite principles, the average employer of architects thinks he can sustitute his own whims.

Instructions given to a lawyer are generally precise statements of events; they are facts as far as they are known to the client. But the instructions the architect receives are often conditional on other things; in other words, the client says: "I want a building of such and such a kind, to accommodate a certain number of people, but I leave you to satisfy me with the result." In the ordinary competition it takes this form: "Certain instructions must be strictly obeyed, but their compliance will not be deemed sufficient for the award of a prize;" in other words, the author must use his own discretion or "give us something better if he can." Many recent competitions have confirmed this assumption. The architect has closely adhered to the programme; he has followed the dimensions and requirements of the leading departments; he has kept within the limit of cost; but his design has failed to gain acceptance. Another author, whose plan shows several departures from the instructions, succeeds in winning the first premium, even although an assessor has been appointed to examine the designs and report on the fulfilment of the conditions. Everybody is surprised at the result; those who have carefully observed the instructions express their astonishment and anger, the rest of the competitors are indignant, and the promoters are scandalised. One of two things is obvious: either the instructions issued to competitors were ignorantly framed, or the assessor has shown his incompetence, or strangely overlooked his duties as a referee. More often than not the committee or their official have blundered; they have drawn up conditions that are either impracticable or defective. They have required something to be done which is physically impossible within the boundaries of site, a department or set of rooms to be placed on the ground floor when there is no room for them; or they have not considered the difficulty of lighting, or the requirements of some local authority. It is a hard case for the compliant competitor who has obeyed instructions, and the only just course for the committee to take is to admit their mistake, and compensate the most deserving, or award the premiums, and then ask a select few to compete again. But the course generally pursued is to stifle their errors, and award the author who has had the courage to use his better judgment by overthrowing the conditions. Of course, competitors naturally protest against a treatment which breaks the compact and gives the prize to the man who sets the instructions at defiance. It seems unfair. At the same time, a broader view of the issues appears more desirable than servile adherence to instructions that are imperfect or defective. Let us take the practical example of a man who seeks for professional advice of his doctor or lawyer. He gives instructions, but he does not bind his adviser down to follow them implicitly: to do so would be to deprive himself of the skill and experience of their profession; nor would a client be so unreasonable as to require his architect to follow closely to instructions—he desires the best plan or design he can obtain. So with the promoters of a competition: they advertise for the best interpretation of their requirements, and it is absurd to expect them to be bound hand and foot by their own conditions, if by so doing they deprive themselves of a better design. There will always be men who interpret *literally*, others who follow only the *spirit* of the instructions—in other words, followers of the *letter* and of the *spirit*. It is for the architect, as a responsible agent, to be guided by principle rather than be fettered by rules and instructions, even if, haply, thereby the weak suffer in the contest.

This view does not apply, of course, to certain instructions, such as those relating to lines of frontage, "ancient lights," or technical by-laws. The architect who ignores the frontage lines by trespassing beyond them, who obscures some neighbouring windows, or who does something contrary to the local by-laws, commits a breach of the contract which places him outside. On the other hand, any instructions which concern the arrangement or location of rooms or design ought not to have the force of obligation, as they are matters within the architect's special functions, and it would always be wiser if building committees and promoters only threw them out as suggestions to be followed or not, as the author saw fit. We think all our leading competitors adopt this distinction between those things which are obligatory and binding and those that are recommendatory only. In other words, we have a case of essentials and non-essentials. Much friction and misunderstanding would be saved if architects made it clear to clients and committees what the effect of certain instructions is, or, on the other hand, if the latter simply stated what were really essential points, and left the architect freedom to act as he saw fit. Take the plan of a building for a public purpose. It is perfectly impossible for a designer to say beforehand whether the conditions imposed by his employer can be carried out. Not until the disposal of the chief rooms or offices on the given site, when walls and areas are drawn to scale, can the architect determine whether a condition is practicable or not. A certain department is to be placed on the ground floor, but it is found impossible to comply, on account of room, and the author locates it on the next floor. If he shows a better arrangement of hall and corridors by so doing, there is no valid reason why this departure should disqualify. Or something may transpire which calls for modification of the instructions, as in the requirements of a public department, a legal question of right of light, convenience of client, &c. Individual interpretation, too, will vary. One man takes an instruction in a literal sense, another in a general sense. What A thinks absolutely important, B may consider only of secondary account. Each man reflects the truth in his own way, and so it is that we find so many diverse constructions put upon seemingly simple instructions; so many different designs for one object. It is to select the best of them that we invite several architects to compete, for if an architectural design could be worked out like a mathematical problem, from certain data or terms, and the solution was the samo in every case, there would be no need of competition—one qualified architect would do as well as another.

Less determinate matters of an artistic kind, although resting on principles, are often left alone by the client; but he has the provoking habit of discounting the taste of his architect, and taking the opinion of decorators and painters. He does not trouble so much about them, because he likes his friends to think he is not behind other people in these matters, and he is afraid to give instructions. Those are in a hopeless case who interfere, who have the audacity to decide on the designs and colours and shades of wall and ceiling decoration, or who think they are quite as competent as the architect to select their own style and to choose their own elevation. Is the architect to submit to such dictation, or what? A man who throws aside all authority and adopts his own political or religious creed does little harm to anybody else, for he has only himself to please; but a man who repudiates the education and professional authority of his architect, and defies the simplest elements of form, or of colour, or of style, does more harm, not only making himself ridiculous, but perpetrating a monstrosity or an eyesore for those who come after him. He is injuring himself and others, disseminating a pernicious taste, which, like a pernicious literature, is destructive to all purity and honesty of thought, not only of his own, but other generations. Who is to lead? The Church or the political organisation can excommunicate or cast off the so-called member who disobeys or ignores the principles of its society, and be rid of him; but the erring or schismatic builder who insists upon having his own way, or the perpetrator of a hideous structure or an artistic outrage, is free to perpetuate his monstrosities, and degrade the taste of the people. His work remains as a reproach to the age, and his influence lives after him.

BUILDING NOMENCLATURE.

VAGUENESS of definition is one of the many obstacles in the way of the instruction of the young architect—we mean of sundry terms which practical men are in the habit of using to define certain materials and modes of construction, but which remain unintelligible to the student. The practical requirements of the architect and builder demand certain trade terms and phrases which are known to all those who write specifications, and their usage in this way has made it the more difficult to substitute other and more correct names. To take a few of these. The nomenclature of the bricklayer is not without pitfalls for the unwary. It takes some time for a novice to master the qualities of the various sorts of bricks—"clamps," "firsts" and "seconds" grey stocks, "place" bricks, "malms" of different qualities, kiln-burnt bricks. Now, some of these names explain themselves, like bricks burnt in kilns or clamps; but it is rather bewildering for the learner to have to

know the differences between "place" bricks, those which are not well burned, and those well burned, or "stocks." Then there are different sorts of malms, each having some name, like "facing paviours," "common stocks," &c. It would be more convenient to distinguish the qualities of each class by "first," "second," "third," or by some letter, A, B, C quality, than to give them different names which are not always clear. The mode of burning or manufacture ought certainly to suggest the generic name, and some distinguishing adjective or letter appended to determine its quality. But if we take up half a dozen specifications, we shall find as many different names given to the same brick, much to the confusion of the young architect who has not specially learned this particular trade. He wants, perhaps, to use the best stocks, the London "malm stock," but is not sure of the right name to describe it. One calls it "facing paviour"; another simply "malm." Colour is essential to him perhaps: he wants a bright yellow-coloured brick, or a stone-coloured brick. The practical builder would know at once that the London malm is the right description for the first kind and the Suffolk for the lighter hue. If the architect wishes to specify the right kind of brick for arches and dressings of uniform colour and texture, he may not be always sure to obtain it by some of the names used; or he may desire to specify the brick to be used for the chief fronts of his building. By using such a term as "best stocks," the evasive contractor may introduce a very different kind to that intended for each case. The terms "firsts" or "cutters" for the arches, &c., and "seconds" for the fronts generally, ought to indicate the sort to be used in each case; but these qualifying terms are not always used. There is equal confusion in the names adopted for red work, cutters and stocks being indifferently used. All this is attributable to the great diversity of terms. As there are only clamp and kiln-burnt bricks, and there are three kinds of clamps recognised according to their fitness and quality for cutters, facing interior walling, paving, &c., it would be easy to distinguish them by some definite name or number.

And it is so with other materials. Take timber. A correspondent, Mr. D. Forbes Smith, has very opportunely called attention to the very loose and indefinite meaning attached to the terms "red" and "yellow" deal, or the difference between them from the same tree. If there is no difference between them, "Why," he pertinently asks, "is the term 'yellow' deal almost exclusively applied to floor-boards? Why, again, is the term deal used in specifications instead of pine? Why the several names "fir," "pine," and "deal" are used, when they are from the same tree, and how they can be distinguished by two colours, are puzzling at least to the student, if not to practical men. Mr. Stevenson's useful explanation is not generally known to either class, though, as he shows, the term "deal" implies a converted piece of wood or portion of a tree. As to the dual signification "yellow" and "red" applied to it, the explanation accounts for the terms, but is not satisfactory. As Mr. Stevenson says, these trade terms are an inheritance of the past and are not easily set aside, a reason which applies to other terms. Unfortunately for learners, the textbooks do not help them, as these explanations are not given.

Then there is some confusion in the nomenclature of masonry. How often are the terms misapplied. Every locality has its own special names for certain kinds of masonry. Look at the difference in the meaning applied to "ashlar." Squared stone masonry and ashlar are the same practically, but a difference lies in the closeness of the jointing. Then, the terms "pitched-faced," "range work," the different sorts of rubble walling, are used in specifications without any very exact meaning. All students of stonework are acquainted with particular local names, as well as methods of measuring. On the whole, the classification of masonry terms is far from being satisfactory. Much, too, is wanted to simplify the nomenclature of building stones. The geological basis, of course, affords an important means of distinguishing between them; but the ordinary terms current are chiefly derived from the names of quarries or localities. Thus, under Bath stone, there are many varieties distinguished by certain qualities of hardness, texture, and colour, but named from the quarry. It seems desirable to classify, first, according to either geological formation or mineralogical character, and then as to texture, and colour. It is very bewildering to find there are two or more names given to the same kind of stone. As in timber and other materials, the names used have become associated with trade, and it is not very easy to introduce a simpler classification. In the matter of slates, much ambiguity exists. Many architects specify Bangor slates without any definite knowledge of the sizes. In the North of England, slates 16 by 10 are often specified, while in the South 20 by 10 and larger are asked for. Again, in specifying Westmoreland slates, which are of several sizes, architects are not sure of the kind they want. Then the terms "best" and "seconds" are exceedingly ambiguous; so are the names red, blue, or grey slates. What does the adjective "best" mean—thin, thick, or from what quarry? The word indeed is not definite, if it does not state the particular quarry or other quality, such as straightness, uniform cleavage thickness, freedom from spots, &c. So in other trades there is much uncertainty in the nomenclature used. Names and terms are employed which are not exact, and may mean diverse things to different tradesmen. There are many ambiguities in plumbing, and the terms employed do not always convey a definite meaning. Other ambiguous terms will occur to all our readers. The classification of building terms, whether relating to materials or technical qualities, is by no means so easy or scientific as it ought to be, and there is a redundance of terms and phrases which do not convey any definite or important difference. A good dictionary of building nomenclature, based on a scientific classification, is a want of the profession and of the age.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE sixth ordinary meeting of the Institute for the present session was held on Monday evening. The president, Professor George Aitchison, R.A., occupied the chair, and delivered the annual

ADDRESS TO STUDENTS.

He remarked that he had the welfare of the students very much at heart, not only because he saw how many of his own youthful days were wasted from having no proper direction, but also because it was the one feature in all architectural epochs over which the elders could have the greatest influence. At present they knew not how to produce genius, nor how to turn the public mind to desire and take an interest in noble architecture. Symbolism had been abolished, so that the bulk of buildings did not tell their tale, and the public were ignorant of what was being done for them. If any statesman knew his business, every good sculptor in the kingdom would be fully employed in sculpturing buildings to tell the poor what was done for them: how they were taught, cured, looked after in their old age, and in their sickness and infirmities, and how law and order, peace and industry, were being taught to the savages who surrounded our Empire. It was in the interests of the students and the art that he had proposed to omit from the examinations all that was not purely architectural, for this now shut out those who had not received a good general schooling. They did not want to shut out a genius, nor even a resolute and determined worker, because he had not learnt Greek, Latin, French, or German. He did not suppose Raffaelle had much schooling when he was taught to draw at three years old, and yet he not only became the greatest painter of modern times, but a sculptor and an architect too. They were not surprised that a man with such inventive genius as Raffaelle should have become skilful as an architectural designer when he had learnt the elements of architecture; but it was surprising that he should have been one of the great constructors of his age, for Bramante on his death-bed recommended him for the post of head architect to St. Peter's. He did not suppose that Palladio had much schooling when he was but a mason's boy, nor our own Ware when he was a chimney-sweep. The president added that he devoted twenty years in trying to gain an insight into the

CAUSES OF THE GREAT ARCHITECTURAL EPOCHS

of Europe, and this was the conclusion he had come to. They seemed to him to result from the set of the public mind towards enriching its age with monuments which embody the general aspirations. To accomplish this there must be hoarded wealth, noble desires, and architectural judgment. There must be, too, those endowed with the genius to express those aspirations architecturally, and highly skilled craftsmen to carry them out. Genius was the power of invention, and was mostly accomplished by that general capacity we called talent. This heavenly gift of genius and this general capacity were, however, only the raw material which had to be worked up. Genius had not only to learn what was necessary to express its conceptions, but to strive to do its best. Architecture was a structural art; and, therefore, the art of construction was the most necessary thing to be known. The science of construction was statics; consequently the elements of statics needed to be known. A knowledge of statics, too, gave us a true ratio between every part of a structure, and it gave the real shape that each part must take; if we were as clever as nature, it would in all probability give us a beautiful shape. Unfortunately, we were far from being so clever, and consequently we had to learn by other means how a beautiful shape can be made out of the necessary shape. For this purpose we must study deceased architecture and nature. Every piece of deceased architecture that we admired could be made to show us the æsthetic laws that governed it and produced its excellence, and these laws were as capable of being employed now as then. Every important portion of an ancient building might have the reason extorted from it as to why it pleased at its creation and pleased us now; but from our greater knowledge, and from the necessity of using other materials, we might see that the proportions then used are not now applicable; for instance, a Greek Doric column showed the statical knowledge of its day, but it certainly did not now. Our materials and climate were different; the emotion now wanted was probably different, and the æsthetic sentiment of our day was probably different too; so we had to get some of our hints and solutions from nature's works. Without the gifts of the mathematical and the artistic capacities, no man should become an architect; but there was another requirement, which we called planning—that was, how to make each room, hall, passage, and staircase answer its purpose, and how to pack them in the most convenient way. This might be called common planning; but there was artistic planning as well, which was the choice of forms which were not only appropriate for use, but were agreeable to the eye. He would by no means discourage anyone who loved architecture and would study it from being an architect, for there were various degrees of power and excellence in architectural works, all of which made up the realm of architecture. The smallest cottage, if properly arranged, perfectly constructed, and perfectly proportioned, might be as delightful to contemplate as the mansion, the palace, the town-hall, or the cathedral, though it did not require the same knowledge, the same daring, and the same invention. Nothing great was reached in fine arts without simplicity, but lovely simplicity was reached by great labour, and took about ten times as long to arrive at as ornateness. Just now there was a great inclination to get effects by exaggeration, or by ways that involved little thought or trouble, such as by the distortion of the Orders,

the sticking on bits of rustication all over a building, or by putting water-gates into the attics of buildings. They should not forget the proverb that "the human mind was greedy of novelty," so much deplored by William Morris and by Mr. Ruskin, though the desire for novelty was natural to man, and could not be overlooked or overcome, for each generation had not the same knowledge or desires as the preceding one. Let them, instead of deploring the taste for novelty, echo Tennyson's words:—"Let the great world spin for ever down the ringing grooves of change." True novelty was obtained by development. They saw how Nature developed her types, and if they had lived in the palmy days of Greece, they would have seen how the young clodhopper was developed into grace and beauty by training. It was rather nauseous and rather ridiculous to hear so much talked of

A NEW STYLE,

particularly when it was supposed that a clever man could invent it. The real new style was to be attained by the improvements that came about by the altering of proportions through our greater knowledge of statics and the strength of materials, by making our buildings perfectly suitable to the new requirements of our age, by the suiting of our mouldings to the climate, by the greater cultivation of outline, and by a deeper knowledge of our own light and shade. It could not be too often impressed on the young that men could not always judge of what they were capable, so that if a student loved the art sincerely, but appeared to have no capacity for it, he could not be sure of this: his capacity might require much cultivation, and if he wooed the art in season and out of season he might find he had it. Etty, who eventually painted flesh so admirably, was the butt of his fellow-students; but by resolutely pursuing his labours and never losing a moment, he became excellent at his art after some twenty or thirty years of unremitting study. The President added:—Moderate your wants, and be contented with the poor pecuniary rewards your industry can attain. Your ambition should be to create something that will charm and elevate your fellow-men through centuries. Those who look for money as the main thing should be surveyors or valuers. Nor am I going to treat architecture as a thing to be done in broken time, nor, to look on it as it is mostly looked on now, as a lower branch of the knowledge of the value of land and the price of bricks; nor as an antiquarian revival; but as a creation of the true and the beautiful as understood and felt in our own day. I mainly address myself

TO THOSE WHO HAVE THE AMBITION

to be poets in marble, stone, brick, iron, and wood, who desire to endow their country with a building that may rival the Parthenon, the Erectheum, the Propylæum, or the Choragic Monument, the Pantheon of Rome, or with one that may vie with the interior of St. Sophia and St. Mark's, with the Scuola di San Marco, with the Cornaro-Spinelli Palace, or with the Town Hall of Brescia. In some of the fine arts the mere exercise of them is its own reward. In the concord of sweet sounds this is certainly the case, and why should not the creation of the true and beautiful in architecture be its own reward. There have been those great and pure souls that asked for nothing; but were contented to help and raise their fellows without even a thought of fame. Surely such exist among us? Cannot some of us be content to endow our country with a priceless treasure, with a monument that all mankind must admire and be thankful for, without an afterthought of fortune or fame?

NOTES ON THE COMPETITION DESIGNS AND DRAWINGS.

Mr. ERNEST GEORGE, vice-president, made some brief criticisms on the designs and drawings submitted for the prizes and studentships in the recent competitions. He remarked: With numerous well-executed drawings before us, we are bound to recognise the proficiency that obtains in the matter of draughtsmanship. I suppose when most of the noble monuments of the past were built, there were no such accomplished draughtsmen as many of you. It is a good thing to attain facility with the fingers and a ready method of expressing ideas, and I believe that it helps materially towards design. Yet original ideas are few, while pretty drawings are many, and a taking manner of drawing sometimes conceals the lack of anything to say. The art may become a snare. It is well to keep in mind the fact that architects' drawings are only a means, and not an end. The are not pictures, but they are documents of the architect's scheme. They should convey to his client an idea of the house he is to have; but their first object is to show the craftsman the work that is to be done. The architect who is head and shoulders above the rest of us confesses to the burning of his beautiful drawings after they have served their practical purpose. This is not a custom one would commend. In preparing these drawings some of you will have speculated on what the assessors desired to see. Taste is a varying quantity, and depends with each of us on the condition of the mind with regard to certain forms or colours that appear to us with freshness or with pleasant associations, or that we see after they have been too often played upon or travestied. Perhaps this is especially felt with certain so-called "Queen Anne" features that were pleasing when first introduced by good hands, but which we have seen done to death. In a street we commonly find the most ornate and richly-decorated building is a public-house, and we feel that a gentleman's house must be severely plain. Choice marbles, again, are so freely used in restaurants and in sanitary works that, from association, we become afraid to employ a beautiful material that Nature has placed in our hands. We are familiarised with so much commonplace and meaningless ornament that the eye rests with pleasure on any broad wall-surface, and we are conscious of a reaction in favour of utter simplicity. A cynic has said that life would be endurable but for its pleasures. We feel that the vernacular buildings around us could be tolerated if cleared of all ornaments and futile efforts to please. It requires an artist's hand to dispose and wisely restrain the sculpture or decoration, which becomes a source of delight when it finds its right position. Still, there is a fitness in all things, and if your subject for design be a concert-hall for a wealthy city, or a mansion for a nobleman, you must not apply to it the bare treatment that would be admirable for a barrack.

THE MEASURED DRAWINGS.

For the measured drawings of "Ancient Buildings in the United Kingdom" six competitors for the medal put in a good appearance. The drawings of Clare College, Cambridge, by Mr. T. Tyrwhitt, have been awarded the prize. This interesting building has been portrayed with thoroughness. We are shown its street front, where stone mullions still obtain, though label mouldings have given place to cornices of Italian origin. The river front, though in harmony with the earlier work, has its fully-developed sash windows, with architraves and keystones. An admirable set of measured drawings of Thaxted Church, Essex, by Mr. Cyril Wontner Smith, receives a Medal of Merit. In "Kot" we have another careful set of drawings, the cloisters at Norwich. The four sides of these cloisters at first suggest repetition, till we note the interesting transition of styles from the Early Decorated to the Late Perpendicular. The mouldings of the various epochs are given with care, though the custom of crowding the paper with mouldings makes them not always legible. Other drawings show care, steady work, and ready draughtsmanship. I do not know whether my colleagues are with me, or whether I am right in making the suggestion that it is not desirable to fill up, with full detail, the whole of each elevation, repeating innumerable mouldings or cusps. I think the balance of the drawing can be kept without all parts being carried to the bitter end, to the weariness of the artist. Personally it distresses me to see mechanical repetition. Prize drawings must not be slovenly or sketchy, and it is, perhaps, difficult to draw the line at anything short of finish.

THE SOANE MEDALLION.

Of the five designs submitted for the concert-hall, there are points to commend in each, although no one design is considered to reach the required standard for the Soane Medallion. The design "Pan" has style, and there is much that we like in the treatment of the exterior. The arcaded upper story is well conceived, though we think the small niches between the projecting columns are unnecessary, and it would be wasteful to put good sculpture in that shady retirement. Above the bold cornice and balustrade we should like the building to cease. We think that a building of this type suffers by a show of roofs. These latter are formed to accommodate the secondary hall: but this smaller hall is worth a better position than it gets in this attic story. In the absence of these roofs, the auditorium might have become an imposing feature in the composition. The plan of this building is less satisfactory than the exterior. Probably the difficulty has been to provide the required seating accommodation, and the hall is injured by its three overgrown galleries; the passages would gain by greater width, both for convenience and safety. The design "34° South" has a well-studied plan. The two galleries are in just proportion to the hall, the passages are of fair width, and the smaller hall is treated with consideration. The elevations of the building are not satisfactory, the proportions and composition of the group are not happy, and the design suffers from many stripes, the eye wearying of rustications from the plinth to the cornice. "Quod erat Faciendum" is a design showing thought, and the elevations have a distinct interest. It is not, perhaps, a bad fault that it is very like a church. The square concert-room is not a satisfactory shape, and the aggressive projection in the middle of a side wall for a royal box would not be tolerated by the most loyal of subjects who cared for music. "Cornice" is a bold, rusticated block, after the manner of a Florentine palace. The treatment is daring and original, and is not without dignity. The long line of columns on the flank wall would look well but for the two tiers of openings between the columns, robbing the latter of their effect as a colonnade. An arcaded treatment of these balconies might have worked better. Of "Lyra" one feels that it is rather a theatre than a concert-hall, but the circular form has its advantages. The dome has an awkward shape, which is emphasised by the strongly-marked ribs upon it. There is simplicity in the general treatment, and we do not blame the design for its broad wall-spaces. With the latter, however, we feel the demand for bolder detail where mouldings and projects appear. There is too much equality about the three rows of cornices and the spaces between them, and we should like more interest about the doorways, which have each a glass shelter over them as their prominent feature. It has been decided that no design is sufficiently satisfactory, both inside and out, to merit the distinction of the Soane Medallion; there is, nevertheless, evidence before us of intelligent study and of good work done, and although unsuccessful for the medal, I am sure you will not look upon your work as wasted. Your time has been well spent on a subject of great interest, and the knowledge you have acquired will one day be turned to account. London is not yet provided with its fitting concert-hall.

THE TITE PRIZE.

"An English Villa and Garden treated in the Italian Style" was, as you know, the subject given last year for the Tite Prize; but the works on that occasion were not considered of sufficient merit to justify the award. The same subject given again has called forth a better response this year from the nine competitors who have entered the lists. Of these schemes, "Andante," by Mr. John Stevens Lee, takes the prize. There is simplicity and propriety about the villa, which, in some designs, has too much the character of a large country house. The plan might in some respects be improved. The central hall with columns would have gained much if it had, in its height, included the first-floor gallery, which would have opened into it. At present this gallery looks out upon the lead flat and skylight—never a comely prospect. The two passages at the ends of the loggia are unnecessary, and might have been included in the loggia. There is art in the scheming of the garden, its features having interest without becoming obstructive. The drawing is incisive and clear, giving good expression to the design. To "Heather," by Mr. Thomas A. Pole, a second prize is awarded. It is a good drawing, showing a house with well-proportioned wings sheltering the upper terrace. The balustrade of this terrace is placed on the edge of a steep bank, where grass would not thrive happily, and I think a wall would have been more suitable in this position. A design distinguished by a device (a circle and triangle) has points of interest and quaint fancy, and there is good character in the house. The manner of the drawing, perhaps, gives it the feeling of being somewhat crowded

and wanting in repose. "Tiber" is one of the less ambitious schemes. It is pleasant and homely, with less effort after features than we find in some of these gardens. The design "White Star" departs from the horizontal and reposeful lines of the Italian treatment. The house is rather suburban in character, and is not quite in sympathy with a formal garden. The rooms are purposely unsymmetrical, the bay windows in each room being brought to a corner, and one end of each bay being cut off by the wall. The villa does not centre with the garden, and we think it desirable that it should do so, when the formal treatment is adopted. I think in devising these gardens a difficulty must have been present to you all; it is that of having no obstacles to surmount in your imaginary garden. In an architectural, or built garden, the incidents that please arise generally from difficulties of level and other problems that have to be fought with: these suggest forms that would hardly occur to one on a clean sheet of paper. There are, nevertheless, many happy devices and suggestions in your several proposals.

THE PUGIN STUDENTSHIP.

For this studentship there is a very creditable show, and the subjects are generally well chosen. The prize is awarded to Mr. de Gruchy, whose merit the Institute has had the opportunity of recognising before, and it is a pleasure to see such work as he sends us. A second prize is given to Mr. Bower, and I am glad to find among his studies the grand tower of St. Mary's, Newark. I do not doubt Mr. Bower has studied also the noble interior of this church. Seeing it again the other day, I was impressed by its dignity, unity, and proportion. It possesses those qualities that are attributed rather exclusively to fine Classic buildings. Mr. Fulton gives us good examples of his work. We like the way he has drawn the vigorous detail of the Scotch carver in the screen from Aberdeen. Whilst studying the old examples of carving, he looks also to the original types: his thistles and other foliage are well put in, as are the crucifix and figures. Mr. Fulton is the recipient of the Aldwinckle Prize, and we shall be interested to see the result of his Spanish campaign. Before leaving these various groups of sketches I would remark that they are nearly all honest and direct in their purpose of delineation, the architectural details being the points of interest. There is not the attempt we sometimes see to give a fictitious interest by dwelling on cracks in the masonry, or dots and spots suggesting rotten bricks. We have seen these incidents forced to give a meretricious prettiness to architectural drawings.

THE OWEN JONES STUDENTSHIP.

For the Owen Jones Studentship there are but two candidates, and the work does not quite reach the level that has been attained by the late winners of the prize. The studies of keramic work, including the Arab Hall of the late Lord Leighton, are freely drawn and put in with good colour. There is, however, no range or variety of subject. The other competitor shows greater diversity, but there is a certain hardness and want of freedom about the work, and some lack of harmony and "quality" in the colour, which are drawbacks to the interest of the subjects portrayed.

THE GRISSELL GOLD MEDAL.

For the Grissell Gold Medal there are many entries, for the subject of a country church of timber is attractive, and should bring out original suggestions. The design marked "Stavekirke," by Mr. Harbottle Reed, receives this prize. A wall of timber is unsuited to take the thrust of a roof, so the architect helps it with an inner range of posts, forming an outside aisle or passage. There is not, however, much thrust from this roof, as, although the principal has an apparent arch, there is practically a tie-beam from plate to plate. I venture to think the arch is no help to to the design. Several of the schemes show a tendency to form arches, sometimes cutting them out of exceptionally large balks of timber, instead of trusting to beams, posts, and struts, which are the natural forms of wood. There are features we like in the good drawing marked "Emce," but we object to the circular-headed windows with voussoirs, a direct following of stone forms. A second prize is awarded to the design "By Lamplight," the work of Mr. W. Stanley Bates. It is a good piece of timber construction, and well-proportioned. The internal design of the roof, with its rather finikin pierced work, is less commendable. In the view of the exterior one feels that the timber and shingle are overladen with lines, to the detriment of the drawing.

The President then proceeded to distribute the prizes in accordance with the list published by us last week, p. 85, and a vote of thanks to him having been proposed by Professor T. Roger Smith, he briefly replied thereto.

REFERENCE BOOKS ON ORNAMENT AND THE DECORATIVE ARTS.*

(*Concluded from page* 90.)

TAKING, now, the special branches of decorative art in alphabetical order, to avoid invidious distinction, the first with which I have to deal is

ARCHITECTURAL ORNAMENT.

Under this head I intend mentioning a few works which it would be difficult to include elsewhere, and first I would call attention to Mr. J. K. Colling's "English Gothic Ornaments," 2 vols., 4to, issued in the fifties, containing over 200 lithographic plates drawn by the author, some being in colours. Some years later he issued a 4to volume under the title of "Art Foliage for Sculpture and Decoration," consisting entirely of his own designs, and after that, "Examples of English Mediæval Foliage and Colour Decoration," many of the plates in which had appeared in "English Gothic Ornaments." Augustus Pugin in 1821 had published a volume of illustrations of "Gothic Stone Ornaments," a work of great value, and the examples differ from those drawn by Mr. Colling. An exceedingly beautiful volume of "Architectural Ornament in Italy" was published a few years since. It consists of 100 permanent photographic plates selected by Prof. Nicolai, of Dresden, and, on account of the large scale of the details and the delicacy of the printing, it is of the greatest value for study, and is far preferable to the works which illustrate modern German examples, not unfrequently asked for. In the Trocadero Museum, Paris, is an unrivalled collection of casts of architectural sculpture of all countries and times, and of this a very comprehensive series of reproductions has recently been published in three small folio volumes, at moderate prices. The photographic reproductions now issued so reasonably, giving perfectly faithful representations of the minutest detail, are indispensable in the section of which I am treating, and a collection of such is far more valuable than a series of casts costing many pounds. Next we come to the books dealing with Arms and Armour. Here the authorities are Meyrick's "Illustrations Ancient Armour," 3 vols., small folio, issued in 1824, and two others, published in 1833, illustrating the celebrated collection at Goodrich Court in Herefordshire. The best smaller work is Hewett's "Ancient Arms and Weapons in Europe," 3 vols., 8vo, issued in 1860, while Mr. Starkie Gardner has just published a little volume, forming one of the "Portfolio" monographs, on "Armour in England." The Art of Bookbinding is now practised by so many students at art schools that the library should contain some standard textbook, and for this I recommend Mr. Zaehnsdorf's practical little work. The books with examples of old bindings are numerous: but I think the best are the two folio volumes recently issued by Mr. W. Y. Fletcher on "English and Foreign Bookbindings" respectively. There is also a small book on "English and French Bookbindings" by this gentleman, composed of two of the excellent monographs of the "Portfolio" series, which forms a good substitute for the larger works.

BOOK ILLUSTRATION.

The volumes which are best worthy of a place in our library for reference on this subject are Mr. Walter Crane's "Decorative Illustration of Books," Pennell's "Pen Drawing and Pen Draughtsmen," and Mr. C. G. Harper's "English Pen Artists." The first gives examples by old masters, and the two latter copious illustrations showing the styles of leading draughtsmen of to-day in all countries.

COLOUR DECORATION.

I have already mentioned the works of Owen Jones and Racinet under "General Reference Books," and these amply fill the need for ornamental detail in colour; but the special application of ornament to the decoration of modern buildings requires separate elucidation, and for this purpose I would add Daly's "Décorations Intérieures Peintes," 2 vols., folio, the examples in which are beautifully printed in colours, and represent decorations carried out in Paris. This is a work of exceptional value to decorators, as it sets before them complete schemes of polychromatic decoration. A very fine work was issued some three years ago under the title of "La Peinture Décorative en France," by Gélis-Didot and Lafillé, giving a fine series of reproductions of water-colour drawings made by the artists from the churches and cathedrals of France, and I know of nothing else so useful for church decoration. The only work of the kind illustrating English church decoration in colour is "Decorative Painting Applied to English Architecture," by E. L. Blackburne, which appeared so far back as 1847, and, though valuable, is fragmentary. One would like to see it replaced by a more important volume on the subject. Here I would add Louis Gruner's 'Fresco Decorations and Stuccos of Palaces and Churches in Italy during the XVth and XVIth Centuries.', The plates in this folio are most minutely engraved, and some are fully coloured, while two coloured plates present a key to the colouring of the remainder. I should have mentioned that on the theory of colour the best little books to consult are Professor Church's "Colour," Field's "Chromotography," and that by the celebrated French chemist, Dr. Chevreul, who died some two years since, aged over 100. For Costume I have already referred to the works of Pugin and Racinet; but in addition to these I think the library should acquire Planche's "Encyclopædia of English Costume," two vols., 4to, published in 1876, Fairholt's "History of Costume in England," now reprinted, and forming two small volumes in Bohn's Library, and Henry Shaw's "Dresses and Decorations of the Middle Ages," collected from various authentic sources, two vols., issued in 1858, containing interesting plates, beautifully drawn and coloured.

FIGURE DRAWING AND SCULPTURE.

It goes without saying that before the artist can draw the figure he must have studied artistic anatomy, and the best textbooks on this subject are Duval's "Artistic Anatomy," a little book of principles, translated from the French, Marshall's "Anatomy for Artists," Sparkes' "Artistic Anatomy," and a work recently published by Professor Thompson on "Art Anatomy for Students," which is of great value, as it gives a number of photographs from nature as well as diagrams. The textbook on figure-drawing is by Mr. Hatton, of the Durham College of Science, entitled "Figure-Drawing and Composition." One must not overlook Walker's "Analysis and Classification of Beauty in Woman," with its fine plates from life by Howard, in 8vo, the first edition of which was issued in 1836. The most complete series of decorative figure studies ever published is in a fine book, known to some of you, by a celebrated French sculptor, M. A. Carrier-Belleuse, entitled "L'Application de la Figure Humaine à la Décoration," which in its 200 plates presents a wonderfully facile series of figure compositions. The fountain source for drawings of cupids, armours, &c., is the work of the celebrated French artist François Boucher, of the 18th century, and a book of a hundred plates of reproductions of his best designs, published in Paris some years since, is still obtainable. Some of the works referred to under "Architectural Ornament" contain examples of figure decoration. For ancient sculpture, I should refer to Miss Mitchell's large octavo "History of Ancient Sculpture," issued in 1883, and for larger illustrations to the two folio volumes issued by the Dilettanti Society in 1809 and 1835. The engravings in these volumes are choicely executed, and the subjects illustrated include examples from Egypt, Greece, and Rome, in marble, bronze, &c. Examples of Greek sculpture will also be found in Stuart and Revett's "Antiquities of Athens," which would be in the architectural section of the library. Flaxman's "Lectures on the Art of Sculpture," delivered at the Royal Academy between 1813 and 1826, were issued in an 8vo volume in 1829, and the illustrations and lectures on such subjects as composition, style, and drapery render it of special value. For a history of "Renaissance Sculpture" we must read Perkin's scarce and well-illustrated volumes on the Italian and Tuscan sculptors.

* Read before the Twentieth Annual Meeting of the Library Association, by Mr. Herbert Batsford.

FLORAL DECORATION AND DESIGN.

This is, as you are aware, a very important division of decorative art. The textbooks may be set down as Lewis F. Day's "Nature in Ornament," Hugh Stannus's "Natural and Artificial Foliage," and Lilley and Midgley's "Book of Studies in Plant-Form." Professor Hulme in 1868 published his useful volume of "Sketches from Nature of Plant-Form," giving details of plants and their adaptability to decoration, and followed this in 1874 by a volume entitled "Plants, their Natural Growth and Ornamental Treatment." These are useful to the artist, but doubtless Professor Hulme would admit that they could be improved upon, could they be issued anew. Then there is the folio volume published by Mr. G. C. Haité, in 1886, dealing with "Plant-Studies," which gives to a good scale drawings of plants made for the decorative artist, with various structural and ornamental details. A very fine series of drawings has been published by a French artist, M. Lambert, consisting of 80 folio plates, printed in colour in imitation of water-colour drawings. A collection of 120 collotype illustrations has also been lately issued under the title of "L'Encyclopédie de la Fleur," giving nearly 300 groupings and artistic arrangements of flowers and fruit, photographed from nature, and I cannot but mention the grand volumes of Herr Gerlach, on "The Plant in Ornament." These are very costly, and many of the illustrations have, in my opinion, no permanent value. This brings us to the important section devoted to Furniture and Woodwork. The only histories are, first, the translation of M. Jaquemart's "Histoire du Mobilier," published in 1878, which deals mainly with French work, and Mr. Lichfield's "Illustrated History of Furniture," first published some five years since, and no doubt familiar to most of you. This is more general, but largely devoted to English work. Two excellent little volumes by M. de Champeaux in the "Bibliothèque de l'Enseignment des Beaux-Arts" deal with French furniture only. For good examples of Early English furniture we must turn to Shaw's "Specimens of Ancient Furniture," 4to, published in 1836; Marshall's "Antique Carved Furniture and Woodwork," issued in 1888; and the two volumes compiled by the late Mr. W. Bliss Sanders. For the later styles we must refer to the works of the celebrated furniture designers of the last century—Chippendale's "The Gentleman and Cabinet-Makers' Director," first published in 1754; Hepplewhite's "Cabinet-Makers' and Upholsterers' Guide," first edition 1791; and Sheraton's "Cabinet-Makers' and Upholsterers' Guide," 1793. Copies of the original editions are rare and costly; but reproductions of all have appeared, and are to be obtained at moderate prices. An interesting volume has just been written by a lady—Mrs. Warren Clouson—on the Chippendale period of furniture in England, telling us all that can be found by research and experience about these great designers. The volume has numerous interesting illustrations. There is a series of portfolios illustrating "Carvings in the South Kensington Museum," and more recently one devoted to "French Carvings in the National Museum" has been issued. The illustrations in these last three portfolios are collotypes from special photographs. For French furniture the designer will find much that is required in the works of Viollet-le-Duc and Havard already referred to; but some other works may be mentioned. Scottish woodwork has been very completely illustrated in a book entitled "Scottish Woodwork of the Sixteenth and Seventeenth Centuries," the examples being drawn by an architect, Mr. J. W. Small. A beautiful series of 60 photographic plates of Renaissance "Italian Woodwork" has been published by Herr Schütz. Perhaps in this section I had better include a few works on Interior Decoration, although the majority of these were touched upon in my former paper on architectural books. For old English work we cannot do better than consult Nash's "Mansions of England in the Olden Time," too well known to need description, and Richardson's "Studies of Old English Mansions," also in four vols., folio, issued between 1841-8, a work of great value, as its illustrations include not only views, but also details of furniture, woodwork, ceilings, plate, &c. There are some fine interiors in Mr. Gotch's more recent work on "The Architecture of the Renaissance in England," and a companion work on the later English styles is appearing under the editorship of two architects, Mr. J. Belcher and Mr. M. E. Macartney. I have spoken of the multiplicity of works on French furniture and woodwork, and in addition to the standard volumes mentioned I should recommend the acquisition of Rouver's "La Renaissance de François 1er à Louis XIII. —Décorations Intérieures," with engraved plates. There is no other work worthily illustrating the woodwork of the Early French Renaissance. The later periods are most adequately represented in M. César Daly's "Motifs Historiques d'Architecture et de Sculpture," which has 250 steel engravings executed with that extravagant care characteristic of so many French publications. For old German woodwork, the most complete book is Paukert's "Die Zimmergotik," a folio containing nearly 200 photo-lithographic plates, full of useful details. The library must of necessity have some authority on heraldry, and the most comprehensive work is the library edition of the Rev. C. Boutell's "Heraldry, Historical and Popular," the last edition of which was published in 1864. This can be supplemented by such works as Berry's "Encyclopædia of Heraldry," which, although it appeared as long since as 1828, is still a standard work. There should also be added Fox Davies' "Public Arms," 4to, first issued in 1891, and now obtainable at a reduced rate; Fairbairn's "Book of Family Crests," 2 vols., and Burke's "Heraldic Illustrations," 3 vols., 8vo. Burke's "General Armoury" is also a very useful book of reference. Alphabets and Illumination I propose to include under one head. Amongst books of alphabets is "A Handbook of Mediæval Alphabets," by Henry Shaw, whom I have before named. He was also the author of an excellent quarto volume on "Illuminated Ornaments from Manuscripts," with beautiful coloured plates, published by Pickering, and of "Alphabets, Numerals, and Devices of the Middle Ages." The "Art of Illumination as Practised in Europe from the Earliest Ages," by Tymms and Sir M. Digby Wyatt, published in 1860, contains 100 plates of alphabets and initial letters, and is a work of considerable scope and interest, quite encyclopædic in character. M. Sylvestre, author of the celebrated work on Palæography, published an "Alphabet Album" in 1843, which contains a number of examples copied from various sources. A little book by Mr. E. F. Strange (of the South Kensington Museum) is a valuable contribution to the subject; while for Renaissance alphabets one cannot do better than refer to M. Sylvestre's book, and to two octavo volumes recently issued by Signor Ongania, the great Italian publisher, entitled "L'Arte della Stampe del Rinascimento Italiano-Venezia." You will be glad to know that Mr. Lewis F. Day will shortly publish a collection of "Old and New Alphabets," specially selected by him. It should not be overlooked that Owen Jones published a folio entitled "1,001 Initial Letters," designed and illuminated by himself, most of which were incorporated in his "Victoria Psalter." On illumination, the books illustrating old examples, in addition to those I have mentioned, are Noel Humphrey's folio "The Illuminated Books of the Middle Ages," issued in 1849, and Westwood's "Facsimiles of Irish Manuscripts," also Westwood's "Paleographia Sacra Pictoria," or facsimiles of illuminated versions of the Bible, 4to, published in 1843-5; the two former are, however, somewhat expensive. For works giving examples of illumination executed in recent times I think the finest are Owen Jones's volume of designs illustrating the Psalms, and Audsley's "Sermon on the Mount," folios published some years ago at high price, but now to be met with at very low ones.

JAPANESE ART.

Considering the important influence that Japanese art has exercised upon modern design, I think a separate place may well be given to it here. The most important English books on the subject are Audsley's and Bowes's "Keramic Art of Japan," two vols., folio, issued in 1875, with very fine plates, and the same author's "Ornamental Arts of Japan," issued in four folio portfolios, containing 100 plates, most of which are beautifully printed in chromolithography. I should also mention Cutler's "Grammar of Japanese Ornament and Design," one of the first books to analyse Japanese Decorative work, while Dr. Anderson's "Pictorial Arts of Japan," 4 vols., folio, is an important and authoritative work, but, as its title proclaims, is chiefly devoted to the works of painters, not decorative artists. It must be borne in mind that the most direct, and probably the best method of studying the Japanese design is from the native sketch and design-books, which are very numerous and mostly readily obtainable. I will content myself with enumerating the three or four small oblong geometric design-books, and the very clever studies of birds and flowers, each forming three volumes, by Bairei Kono and Watanebei Seitei, the two best-known living artists in Japan. A few specimens of the famous coloured prints, such as can be met with in albums, or in separate sheets, would make a very interesting addition to this part of the library; but they require some little care in selection in order to secure good colouring. Under the head of

METAL WORK,

I will include works on iron and the precious metals; but on the latter I am only able to suggest to you the two octavos on "Old English and French Plate," by Mr. Cripps, and a large octavo, richly illustrated, by Mr. Havard, to whose "Dictionnaire de l'Ameublement" I have already referred. His new work is entitled "L'Histoire de l'Orfévrerie," and it contains a splendid series of illustrations. A volume has also been published partly illustrating, by photogravure plates, a special exhibit of Old English Plate at Cambridge in 1895, and it is only to be regretted that more of the collection was not represented. No better history of metal-work as a whole has been published than Sir M. Digby Wyatt's folio, issued in 1852, which has a series of 50 good plates of choice examples from different countries. But for a sketch of the history of Artistic Ironwork we must refer to Mr. Starkie Gardner's two little volumes recently issued in the South Kensington Handbook series. I have not previously made individual reference to the volumes in this series, but I make an exception in this case, for they are of special value, and have only recently appeared. Professor Meyer, author of the "Handbook of Ornament," has also written a work on "Smiths'-work," translation of which has been brought out under the title of "Art Smithing." Some practical details of the craft are here dealt with, and many illustrations are included. English ironwork has hitherto been but sparsely illustrated, but an interesting series of examples of late work is shown in Ebbett's "Decorative Wrought Ironwork of the 17th and 18th Centuries," a small folio published some years since. Recently a reproduction of a scarce book of "Designs for Ironwork," by John Tijou, has been brought out. Mr. Starkie Gardner tells us that Tijou undoubtedly designed the iron gates of Hampton Court Palace and those of St. Paul's Cathedral, although some of the designs in the book are not exactly as executed. It is to be hoped that we may get a comprehensive work on English ironwork from Mr. Starkie Gardner before long, as such a work is much needed. A rare volume of Designs, by Fordrin, a French smith, contemporary with Tijou, has been reproduced; the designs are very graceful. The best works illustrating foreign ironwork are Heftner-Alteneck's two small folios, "Eisenwerke des Mittelalters." The first series was also issued under the title "Serrurerie du Moyen Age." The second series may not be known to you, as it was published many years after the first, and only under the German title. Herr F. Halselmann, an architect of Munich, formed a very remarkable collection of knockers, keys, finger-plates, &c., and this has been illustrated in a moderately-priced folio, the plates being reproduced from photographs taken from the objects as they hung upon the walls. I think I may say that this collection has a unique value. Another work of the greatest possible use, and of which I ought to have made earlier mention, is T. H. King's "L'Orfévrerie et les Ouvrages en Metal du Moyen Age. Probably many of you know this author's remarkable "Study Book of the Architecture of the Middle Ages. In his book on metal-work he gives 200 folio plates of measured—one might almost say working—drawings of ecclesiastical metal-work, entirely Continental, and the whole of the measurements and drawings were made by Mr. King himself, occupying some twenty years of his life. A German folio, entitled "Schmiedekunst," has 100 plates illustrating old German ironwork, and is issued at a moderate price. Numerous examples of domestic ironwork are illustrated in this work. The finest specimens of Spanish ironwork are to be found the rich "Rejas" or screens in the churches and cathedrals. Many of these are illustrated in a recent folio volume of drawings of "Renaissance

Architecture and Ornament in Spain," by Mr. A. N. Prentice, a young architect who has twice visited Spain. The subject of

MOSAIC WORK

claims our attention, and here the authorities are not numerous. The best known is Sir M. Digby Wyatt's folio, entitled "Specimens of the Geometric Mosaics of the Middle Ages," with a brief historical account of the art. This has some plates printed in gold and colour, but it has been pointed out that the specimens do not show the tesserae of the mosaics. A young architect, Mr. A. T. Bolton, recently published a folio of rubbings of "Some Roman and Pompeian Mosaics," in the hope that they would be of special value to artists. In addition to this, we have Henry Shaw's "Specimens of Tile Pavements," another quarto by this versatile archæologist, issued in 1858, with numerous coloured examples, and a French work, Amé's "Carrelagés Emaillés du Moyen-Age et de la Renaissance," a 4to published in 1859, but not often to be met with now. Another volume, the great value of which is not to be judged from its title, is "Nouveaux Mélanges d'Archæologie," by two celebrated French archæologists, MM. Cahier and Martin. It contains 250 plates, printed in tints, of innumerable geometric tiles and pavings selected from foreign cathedrals and churches. Opportunity should be sought of obtaining some plates of William Fowler's fine folio coloured engravings of "Mosaic Pavements and Stained Glass in England," issued between the years 1796-1820. A complete set is scarce and costly. Turning our attention now to pottery and porcelain, and taking English pottery first, the best-known book is Jewitt's "Ceramic Art of Great Britain," 2 vols., 8vo. Further works on English pottery are Binn's "Two Centuries of Keramic Art in Worcester" (be careful to have the second edition), Solon's "Art of the Old English Potter," Owen's "A Century of Potting at Bristol," Haslem's "Old Derby Pottery," and Miss Meteyard's "Life of Josiah Wedgwood." All these are octavos. Wedgwood's work has been more fully illustrated in three small folio volumes, containing autotyped reproductions from photographs, entitled "Choice Examples of Wedgwood Art," "Memorials of Wedgwood," and "Wedgwood and His Work." Mr. Birch's "History of Ancient Pottery" is the best authority on this period, and for a general survey of the subject we cannot do better than refer to Marryatt's "History," and Mrs. Palliser's translation of M. Jacquemart's "History of the Keramic Art," issued in 1877, also to Chaffers' "Keramic Gallery," 2 vols., large 8vo, containing 600 photographic plates of choice examples of the different wares. Of course, Chaffer's "Marks and Monograms on Pottery and Porcelain" should be in every library. To Japanese art I have previously referred, and have there mentioned the works on the pottery of that country. The library should try to secure the grand works of Delange, entitled "Œuvres de Bernard Pallisy," "Faience Italienne," and "Faience de Henry II.," for quite irrespective of the worth of these books in the illustration of their subjects, the beautiful execution of their plates and the diversity of ornament shown in the examples render them invaluable as aids in design. There are numerous works on

STAINED GLASS,

and some fine folios illustrating the glass in certain Continental cathedrals; but we must content ourselves with works treating the subject more generally. I may remark that it is almost an impossibility to adequately represent a coloured window by means of chromo-lithography; but Lévy and Capronnier's "Histoire de la Peinture sur Verre," a 4to issued in Brussels in 1860, contains some of the best reproductions which have appeared. It has 37 plates, most of which are richly coloured. Then comes Winston's "Inquiry into the Different Styles Observable in Ancient Glass-Painting in England," 2 vols., 8vo, first issued in 1847, and one must not forget another book issued by him, not so well known, but of great value, entitled "Memoirs Illustrative of the Art of Glass-Painting," which is fully illustrated. The most exhaustive and valuable history is Mr. N. H. J. Westlake's "History of Design in Painted Glass," in all periods and countries, now completed in four volumes, small folio, profusely illustrated in black and white. I daresay many of you have already noticed that Mr. Lewis F. Day, who passed some of the early years of his art life with artists in stained-glass, has just published a book, the result of 25 years' study of his subject, which he calls "Windows: a Book about Stained and Painted Glass," which I have reason to believe will prove as useful and instructive as his other works. Some good examples, particularly of Belgian work, are to be found in two folios, known as "Divers Works of Early Masters in Ecclesiastical Decoration," published in 1846, some plates of which were drawn by Owen Jones, and there are reliable historical accounts of the glass illustrated. For special details, such as lead-glazing, we must refer to an octavo issued in 1849 by the late Sir A. W. Franks, called "A Book of Ornamental Glazing Quarries," and to the reproduction of "A Book of Sundry Draughts, Principally Serving for Glaziers," a rare 8vo, first issued in 1615 by W. Geddes, and reproduced in 1848 by our oft-mentioned authority, Henry Shaw. On Domestic Glass I am sorry to say we have only an expensive book to refer to—namely, an illustrated catalogue of the collection formed by the late Mr. Felix Slade, and now in the British Museum. This catalogue is beautifully produced, and was published for private circulation only in 1871. The collection itself was valued at £20,000, so we may gather that the catalogue illustrates some beautiful work. There is an interesting little book by Pellatt, entitled "Curiosities of Glass-making," with coloured plates, published in 1949. For an exhaustive illustrative account of ancient glass, our guide must be Deville's "L'Art de la Verrerie dans l'Antiquité," a large 4to issued in 1873, which has 112 tinted and coloured plates of examples of historic glass. On Symbolism the library should have one or two authorities, and these should be Mrs. Jameson's beautiful volumes, "Sacred and Legendary Art," now issued at a reduced price, and Miss Louisa Twining's "Symbols and Emblems of Art," a 4to published in 1852, and on this subject, again, you will find Pugin's "Glossary" of great value for reference. Audsley's "Handbook of Christian Symbolism" is a concise little book on the subject, and is the only small one having coloured plates. With the books on Textile Design I will include those on Lace and Embroidery. The two most important works that have been published illustrating textile fabrics are Dupont-Auberville's "L'Ornement des Tissus," which is an encyclopædia of textile design, showing about 2,000 examples chronologically arranged, and printed in colours, with historical notes, and Dr. Fischbach's "Ornamente der Gewebe," which illustrates on 160 plates about 1,000 designs compiled from important collections. Mention should particularly be made of the important series of permanent photographic reproductions, made by Professor Kumsch, of the remarkable collection of textile patterns in the Royal Museum at Dresden, issued in several portfolios. On lace-work, the best known authority is Mrs. Palliser's "History of Lace," an 8vo first issued in 1865, but this is not to be compared with the scarce folio by M. Sequin, entitled "Histoire de la Dentelle." One of Herr Kumsch's portfolios illustrates the lace and embroidery in the Dresden Museum, and other folios have been published illustrating special collections. For embroidery there are two scarce octavos issued by Mrs. Dolby on "Ecclesiastical Embroidery and Church Vestments"; this is also treated in Pugin's "Glossary of Ecclesiastical Costume," previously referred to. Lady Marion Alford's "Needlework as an Art," and Mrs. Barber's "Specimens of Old Embroidery," a small folio giving coloured illustrations of some 30 early examples, are important; but above all we must place a large folio, published some four years since at Angers, entitled "La Broderie," by M. D. Farcy. This has 160 plates, and forms the most valuable contribution to the illustration of the subject which has yet appeared.

WOOD-CARVING.

Many of the works I should have recommended as dealing with this subject have been mentioned under the heading of woodwork; but for good studies, in addition to those there referred to, I suggest Lessing's "Holschnitzereien," which contains over 50 collotype plates of the woodwork of the 15th and 16th centuries in the Berlin Museum, while for Gothic work a volume issued recently by Mr. Franklyn A. Crallan, entitled "Details of Gothic Wood-Carving from the 14th and 15th Centuries," may be commended. There are several small books of instruction by Bemrose, Leland, Phillips, and Miss Rowe, of the School of Art Wood-Carving, amongst others. It is important to refer to my list of books on Furniture, Woodwork, and Architectural Ornament, as so many of the designs contained in the books referred to there are peculiarly adaptable to wood-carving of the more elaborate description. Very few works have been published which one can safely recommend as illustrating Modern Art. It is surmised that the library will contain some of the leading art magazines, and one must not forget the grand folio, illustrating the work of Alfred Stevens, the English Michael Angelo, prepared as a labour of love by Mr. Hugh Stannus, or Mr. Aymer Vallance's recent "Life of William Morris"; but both of these are costly. Some of Mr. Walter Crane's best designs have been published in book form, notably in such works as the "The First of May" and "The Echoes of Hellas." The lives of artists, such as Sir Edward Burne-Jones, Albert Moore, Sir Frederic Leighton, and many others, hardly come within the scope of my list, as although most of them applied some of their powers to decorative art, it is by their works as artists that they are chiefly remembered. Early in the preparation of my paper I found a difficulty in limiting the number of works on the various subjects, and I feel that I am speaking to many, who, in their professional capicity, are acquainted not only with a number of works to which I have directed attention, but also with many which I have not mentioned. Had time allowed, I should have felt tempted to speak of more volumes, but this might have led to a departure from the limits of my title.

FIREPROOF CONSTRUCTION OF DOMESTIC BUILDINGS.*

If a certain amount of timber were allotted to be used in the construction of a dwelling-house, and the instructions were that it was to be distributed in a way that, should the window curtains or carpets take fire from a spark, a lighted match, or the upsetting of a paraffin lamp, some portion of the timber would be fairly certain to catch alight and the fire to spread with the greatest rapidity, no better arrangement could be devised than the one usually adopted in house building. Wood joists, about 12in. apart, reaching from wall to wall, over the entire area of the buildings, and resting on wood wall plates, is the first step in this direction; wood floor-boards to form a walking surface cross these at right angles on top, and wood plastering laths pass at right angles beneath to form the ceilings of rooms below; a similar arrangement is adopted for lighting coal fires in ordinary grates, the crossing and recrossing and the space between affording excellent facilities for the fire to play round the wood, and air to circulate and to assist combustion. This arrangement, which begins with the ground floor, is repeated every three or four yards in height to the top of the building, where the roof, constructed with wood ceiling joists, wood rafters, and wood ceiling and slate laths is ready to supply its quota of combustible materials on the slightest provocation. Wood partitions for dividing the floor area into rooms are often formed of timber quarterings placed 12in. apart, cross-lathed on both sides, and affording unusual facilities for carrying the flames upwards from floor to floor. Bricks are sometimes built in between the wood uprights, and these to a great extent lessen the danger. Wood skirtings, dadoes, match-boarding, or wainscotting are fixed round rooms to wood battens nailed to wood plugs, driven into the mortar joints, and sometimes into the chimney-flues. A space is usually left between the back of this woodwork and the wall to prevent decay; the air having unchecked circulation through this space, a fire is rapidly communicated from room to room. Wood stairs commence at the lowest floor and finish at the highest, and, as a rule, there is practically no disconnection of wood between the bottom floor of a house and the top floor, and no severance or barrier to check ascending flames; a strong upward current of heated air is provided at the bottom by the well-hole of the stairs, and when once the latter are well alight all escape from the upper rooms is cut off. A startling statement is to be found in the London Fire Brigade's annual report—viz., that for the last thirty years the number of fires and the loss of life therefrom have gradually increased; the total number of fires in 1866 was 1,338, 44 lives being lost, as against 3,494 fires in

* By Thomas Potter, of Alresford, Hants. A paper read at the Society of Arts on Wednesday evening, Jan. 26, 1898.

1896 and 106 lives lost. The expression "fireproof" has a conditional meaning; no building can be said to be absolutely fireproof; sufficient time and material for prolonged combustion are all that is necessary to reduce the most fire-resisting building to ruins. It has, however, become usual to designate those buildings fireproof where the materials used in construction are incombustible. Fire-resisting would be more appropriate, but, except in the Building Act, it is seldom used. The only explanation that can be given why fireproofing is comparatively so little adopted at the present time is that the great majority of houses are erected to sell, or to let at an annual rental; and, as buildings can be insured for their full value, the owner is secured from a monetary loss. A good deal of misconception exists as to which portions of a house should be rendered fire-resisting, and also an exaggerated notion as to the extra cost. The external walls of houses are almost without exception compelled to be built of incombustible materials; but the two factors in construction which are the main cause of loss of life by fire in domestic buildings are the wood stairs and the wood floors, and assuming these to be formed of materials that will resist a moderate fire for a couple of hours at most, the skirtings, doors, door surroundings, windows, fittings, carpets, curtains, and furniture combined would not in themselves be a source of much danger beyond the apartment containing them, and may, therefore, be considered as factors of secondary importance in connection with fire resistance. But so far as regards skirtings they would always be better if constructed with Portland, Keene's, or Parian cement. There is no objection to cement skirtings, except that they cost somewhat more than wood; they are far more durable, solid, not readily damaged, and non-absorbent, and even on sanitary grounds alone should become more general than is the case. Stairs should be of concrete—stone is unreliable. The cost of concrete stairs is more than wood stairs, but unless of intricate design by no means a serious item. Concrete stairs are constructed by casting each step in a mould, or casting the whole flight *in situ*, and the principle of construction is now well understood. The best materials for concrete stairs, both for strength and fire resistance, are Portland cement and crushed bricks—firebrick by preference—clinker from furnaces or slag from iron ore. Oak and other hardwood stairs of a defined thickness are classed as fire-resisting under the London Building Act, but given sufficient fire they add fuel to the flames. Wainscotting, dadoes, and wood cornices can be entirely dispensed with where protection from fire is of paramount importance, or if necessary formed with cement. Wood liftings and boxing shutters can well give way to revolving shutters of steel or hard wood. There is but trifling danger in the latter because the amount of wood required is so small that it need scarcely be taken into account. Considering the neatness and efficacy of revolving shutters, it is strange they should not be more generally adopted for houses where shutters are considered necessary, especially as the cost is less than the ponderous boxing shutters. The portions of sash-frames more exposed than others are the inside lining, pulley stiles, heads and sills, and if these were made of teak, which would resist any moderate fire after the paint on the surface had burned away, another element of danger would be avoided. The extra cost would be, possibly, from 8s. to 15s. per window, according to size. Architraves to doors and windows, and window-jambs or linings, can be formed of cement at a somewhat increased cost, where the use of wood is not desirable; but door-jambs, doors, windows, and fitments, such as cupboards, dressers, linen-presses, shelving, and the like, must apparently still be of wood, for there is no other material which serves the purposes equally as well for habitable buildings. The wood just named in an ordinary building is classed under the general term of joinery, and is mainly exposed to view. But the dangerous factor in a building is the hidden timber, which is of much greater proportion, and being practically out of sight, may smoulder and burst into flames without any previous warning whatever. Under this head we get floor-joists, partitions, wall-plates, templates, lintels, roof-timbers, occasionally wood battening fixed against brick walls for lathing thereto, or for matchboarding. It is common knowledge to everyone engaged in building operations that all these can be dispensed with, and incombustible materials substituted with no more trouble, but at some increase of cost, and the latter is the crux of the whole matter. In place of partitions formed of wood and lath-and-plaster, they can now be constructed in various ways of materials that will not burn, such as iron uprights, metallic lathing and ordinary plaster, solid plaster with iron rods imbedded therein, fireproof blocks, breeze, concrete, and other materials, all of which are light and fire-resisting. Fireproof cokebreeze lintels, in which small metal tension-rods are imbedded, for use internally over doors and windows, are readily obtainable. Cokebreeze blocks or bricks to insert in walls for fixing joinery thereto are in every way preferable to, and better than, wood; and if new or old walls require to be battened for plastering, as is practised in external walls of some seaside houses to prevent rain from penetrating, metallic lathing can be fixed to metal lathing bars secured by galvanised wall-hooks. Externally, the roof is the dangerous factor in construction; where barge-boards, dormer windows, and skylight frames are in evidence, danger exists if a fire is in progress in the neighbourhood through sparks being carried by the wind. Under the old Building Act, windows had to be set back at least 4½in. from the face of any wall, but now they may be flush therewith. All the outside wood window linings in this arrangement can now be exposed; under the old Act they were almost entirely out of harm's way in the brickwork reveal. Fireproof roofs are obviously more difficult to construct than the usual wood type, except a flat form is substituted, and although objections may be made to flat roofs for country houses and suburban villas on the ground of appearance, there can be but few reasons why they should not be adopted in streets in towns. In addition to safety from fire, flat roofs do away with the great danger in towns arising from tiles and slates being deposited on the heads of foot passengers during high winds; they also save the annual recurring cost of tile and slate repairs, and the danger of flooding from choked lead gutters and down pipes. They have other advantages in connection with workmen's flats and similar buildings where the laundry is on the top floor, in being available for drying-places, and there is no reason why flower-beds and gardens should not be established thereon. Flat roofs are usually constructed in much the same way as fireproof floors, but laid to a slight inclination to carry rain-water away into the stack-pipes, and covered with the best mineral asphalte; but concrete and cement alone, with the greatest care, will not form a watertight roof. A roof of this description should be more durable than others, and entirely avoid the necessity of repairs for almost an indefinite period. The cost, too, would in many positions not exceed that of the ordinary slate or tile roof, lead gutters and other accessories taken into account; while as regards security from fire, not a particle of wood need enter into their construction. Fireproof roofs are being adopted for some buildings, but by far the great minority; and but little difference of opinion exists as to what materials should be used, and how they should be applied. But a fireproof roof is of no avail if the floors are constructed of wood, and when we come to fireproof floors we have to deal with a factor in construction upon which opinion differs to a very great extent. As a result, except where Building Acts and by-laws compel their adoption, they are, comparatively speaking, but little used. The reasons for this are many. By some persons they are supposed to take up much more space than wood; that even if covered with wood flooring they are still cold to walk upon; that the weight is excessive; that they conduct sound more readily than wood; and other objections which do not, or need not, exist; but the principal one is, as in many other matters connected with the erection of new buildings—cost. They are regarded as a "luxury" in construction, and when estimates have to be reduced it is often the case that the first thing to go (if the Building Act permits) is the fireproof floors. We have heard of many wide estimates as to the cost of fireproof construction above that of ordinary construction, ranging from 10 to 50 per cent. There will always be a considerable difference in the ratio of cost, for a building with no pretensions to internal decoration or external architecture, such as workmen's flats, requires equally as much flooring as a mansion costing twice as much but of the same size. Taking average buildings of moderate pretensions, it will be found that wood floors complete, including the wood lathing for ceilings, cost, on an average about 5 to 7½ per cent. of the total outlay, and that fireproof floors average about double that of wood floors. Assuming, therefore, that a house costs £2,000 to build, and is of the annual value of £150, the fireproof floors at the very utmost should work out at a cost not exceeding £150 in excess of wood floors, and this at 5 per cent. would increase the rent by £7 10s. a year. Fireproof roofs cost but little more than the usual kind, and the extra expenditure on stairs and all the other details of construction enumerated, except architraves to doors, which are not strictly necessary to be of cement, would be well covered by another £150; so that for £15 a year, at most, increase of rental on a house of the estimated annual value of £150, the owner would gain by having fewer repairs to pay for, and the tenant would gain by reason of its healthfulness, freedom from vermin, and security against fire. If a large reduction of fire insurance premium on both house and its contents was obtainable—and it ought to be through danger from fire being almost *nil*—there should be practically very little increased rental necessary. On hygienic grounds, fireproof floors have not received the consideration they should do. In external walls of buildings it is sometimes the practice to insert ventilating bricks to admit air to the floor timbers, with a view to prevent their decay. Where the floorboards have shrunk or been badly laid, an imperceptible current of air to the room above is the result, bringing with it a return of some portion of the palpable dust that has found its way beneath the floor, and the housewife wonders where all the dust on her furniture comes from. If the floor timbers acquire dry rot—by no means an uncommon occurrence, even in well-built houses, the initial stage often developing before wood leaves the docks—a rank fungus is the result, which spreads with alarming rapidity, and is in a high degree dangerous to health. It must be conceded that fireproof floors are to some extent a costly item in a building designed with a view to resist fire; on the other hand, it is my object to convince you that no building is reasonably safe which has wood floors and stairs, and that, on hygienic grounds alone, fireproof floors are worth the extra cost, even where cost is the paramount factor in construction. Very much less is known in a general way about fireproof floors than about most other details of building construction, and they do not possess any attractive features whatever. Nothing of a fireproof character, except brick arches, which were confined to basements and underground rooms where injury from outward thrust could be guarded against, was attempted in this country until quite modern times. This is to be accounted for by reason of suitable materials for the purpose being practically unknown a century ago. Portland cement had not been discovered, rolled iron and steel were unknown, and concrete itself—so well understood by the Romans—was not in use in this country even for foundations. In 1775 a patent was granted to Mr. Hartley for fireproofing wood in buildings by nailing thin iron sheets round floor joists and other timbers, and Parliament voted a sum of money to continue the experiments, but the result was a failure, and a little later Earl Stanhope proposed to fill in between wood joists with rough mortar laid on wood laths—what is known as pugging, and used at the present time not so much with the object of making floors fireproof as to prevent sound from passing through. Mr. Fairbairn, in his book, "The Application of Cast and Wrought Iron Work to Buildings," says the first instance of the successful application of cast-iron beams for the fireproof floors of a building was for a cotton-mill erected in 1801: the ironwork was designed by Messrs. Boulton and Watt, the cast-iron columns being entirely unprotected. Up to 1844, numerous patents had been taken out for fireproof floors, but none came to stay until Dr. Fox introduced what was afterwards known as Fox and Barrett's floor Barrett being the business partner), and which was in use until quite recent years. Fox and Barrett's floor was very popular in London and elsewhere for many years. Mr. Wilkinson, of Newcastle, patented several varieties of floors in 1854 and later dates: one was formed with brick arches and concrete over; another was a flat arch section of Portland cement concrete, the latter possibly the forerunner of concrete arches of considerable span. Bunnett's floor, introduced in 1858, was at that

time of novel construction—viz., hollow interlocking burnt clay blocks or bricks joggling or keying each other at the joints. This principle has been practised in a variety of ways in America, but does not as yet find much favour in this country. The under side of the blocks had a dovetail groove to afford a key for the plaster, an idea which has since then been claimed as part of numerous floor patents. The floors of the Grosvenor Hotel at Pimlico are Bunnett's. Dennett's floor, introduced in 1857, is another that has been used to a very great extent. Originally it was made with plaster of Paris as the cementitious ingredient, and consisted of segmental arches up to 17ft. span, and cast-iron beams. Subsequently Dennett introduced various improvements. All the floors of St. Thomas's Hospital are Dennett's. Matthew Allen, a builder of Finsbury, brought out fireproof floors in 1862, consisting of bars of iron 3in. by ⅜in., laid edgewise across the building from front to back, and 2ft. apart, and through which ½in. iron rods, also 2ft. apart, were passed and secured to the bars at the end. A temporary scaffold was fixed beneath and cement concrete was thrown in to a thickness of 4in. The floors of the Waterlow model dwellings in Finsbury are executed in this way. Mr. Hornblower, an architect of Liverpool, in 1873 recognised the danger of exposing iron beams to fire, and devised an ingenious arrangement of encasing them entirely with burnt clay or terracotta. Hornblower's floor was used for the Liverpool Corn Exchange and many other buildings. Previous to this Hornblower had employed clay tubes, or pipes, resting on the bottom flanges of the joists, and covering the latter on under side with an inch in thickness or more of concrete, a mistake which was soon rectified by others, as in Swarbrick's fireclay lintel floors. In Hornblower's tubes, Swarbrick's slotted lintols, and Bunnett's dovetail grooves we can trace the origin of tubular lintols for fire-resisting floors as used at the present time. But during the last twenty years many varieties of fireproof floors have been introduced, over 200 patents having been applied for in this country alone, but the comparatively few that have been used to any extent are divisible into not more than four types. I am not going to suggest that any floor mentioned here is superior to others; they are simply illustrations of floors in the early history of fireproof construction, and of types of others in use now. It was suggested at one time that solid wood floors would resist combustion and possess many advantages over steel and concrete. The principle proposed was to form them with deals and battens edgewise and fixed close together. This system has been practised in America, but in a paper read lately by Mr. W. L. B. Mudie, an architect, of Chicago, the author said that this principle of slow burning floors was not justified by experience, for when once a building got well alight they made a terribly intense fire. Oak is always assumed to be fire-resisting to a high degree, but Mr. E. C. Shankland, M.S.C.E., lately stated that 80,000ft.—superficial feet, probably—of oak timber was piled in a new building for the Chicago Athletic Club, and while the building was in progress a fire took place and the whole of the oak was destroyed. Silicate cotton and asbestos have both been suggested for packing between and around all hidden timbers, but the dangerous factor wood is still in existence, only waiting for a loophole to prove how difficult it is to make a building fire-resisting, yet there can be no doubt that silicate cotton and asbestos afford very great protection. But, with all their disadvantages it is pretty well agreed that steel beams and joints and Portland cement concrete, or clay tiles or lintols in combination, judiciously treated, are up to the present time the best materials we know of for forming fireproof floors, although in the United States steel beams and porous terracotta are more in favour. Flat slab floors of concrete, without beams of any kind, simply resting on the walls, have been advocated and adopted to a very limited extent; then we have steel joists fixed certain distances apart, 3ft. to 6ft. usually, and concrete filled in between level with the top flange and an inch or so below the bottom flange—other types of floors consist in imbedding iron or steel in the concrete when in a soft state; then we have arched formed floors and level ceilings, and lintol floors consisting of clay lintols resting on the bottom flanges of beams or joists, and concrete filled in over. But in selecting one or other of the systems named, or of any other form of construction, the properties of the materials to be employed should be the first consideration. It is well known that steel beams and joists expand and buckle when exposed to heat, and that in a high temperature the loss of strength is also considerable. These are two disadvantages that can only be remedied in one way—and that is by so protecting them that it shall not be possible in domestic buildings for a fire of one or two hours' duration to injure them. By beams I mean deep single sections, or two or more sections of rolled steel forming compound beams, or riveted plate girders to carry smaller sections, which I call joists, the terms being synonymous with those used in wood-floor construction. Where beams are used, a portion usually projects below the ceiling line, and have a much larger superficial area needing protection than the joists. Moreover, they support a large portion of the entire floor, and shou'd therefore have the greatest possible protection; but, instead of this, so far as my observation goes, the usual custom is to wedge light pieces of wood between the top and bottom flanges, about a foot apart, flush with the outside edges of the flanges, and to which metallic lathing is nailed, and this is plastered in the usual way. When the wood blocks become so hot that combustion ensues, the lathing and plastering must inevitably come away, and the beam being exposed, it is almost bound to collapse.

(To be concluded.)

HYDRAULIC v. ELECTRIC ELEVATORS.

THE relative advantages of hydraulic and electric elevators have been much discussed of late. The city engineer of Toronto, Canada (Mr. Ed. H. Keating, M.Am.Soc.C.E.), has reported on the question. As far as safety, reliability, facility of handling, and smoothness are concerned, Mr. Keating says there "is little room for choice between the most modern type of hydraulic machine and the latest improved electrical appliances—that is, the one is practically quite as safe, reliable, easily handled, and smooth in running as the other." Indeed, he seems to show that with the hydraulic elevator of the best type, operated by high duty pumps, there would be a slight advantage, as far as fuel consumption is concerned, in favour of the hydraulic system. As to which is cheaper, it is impossible to arrive at any decision until the conditions under which each is to be operated are known. As to repairs and maintenance, Mr. Keating thinks the advantage is on the side of the hydraulic plant. The question is a very important one for architects and engineers both here and in America; but it seems to us the difficulty in obtaining reliable evidence from those in charge of one system or the other precludes any satisfactory result being obtained.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—XV.

By an Assoc. Inst. Elect. Engs.

WIRING.

THE wiring of a building for electric-light purposes is a very important, and, to some extent, a distinct branch of electric-light work. It is also well within the province of the architect's work, and the following notes have been framed to assist him in this branch of his work. Having decided upon the details of distribution, the next problem is that of wiring, and it is important that the insulated conductors should be supported and fixed in a thoroughly neat and workmanlike manner, and at the same time be well protected from mechanical injury in one of the following ways:—

(*a*) By being inclosed in wood casing.

(*b*) By being supported in plain sight and at sufficiently frequent intervals by porcelain or wood cleats.

(*c*) By being inclosed in damp-proof, fireproof, impenetrable tubes.

Whichever system is used, it will be well to remember (1) that where practicable all conductors in a building should be so placed as to be easily accessible, and capable of being thoroughly inspected whenever required. (2) That conductors should not be run out of sight, such as between floors and ceilings, inside roofs, behind skirting boards, wainscoting, &c., if it can be avoided. (3) That no conductor should be placed where it would be liable to injury of any kind, either mechanical or otherwise, nor where it would be subjected to a temperature that might affect the insulation upon it. For interior work, no naked conductor or conductors should be allowed. Probably the most common method of protecting conductors is to use wood casing.

Wood Casing.—For high-class work the casing consists of continuous lengths of substantial hardwood (preferably the best American whitewood) 12ft. long, on one side of which two channels are grooved and separated by a fillet or width of wood not less than ⅛in. for small branch wires and 1in. for mains and principal branches. The width of the casing varies from 1½in. to 6in., according to the cable used. The front is covered

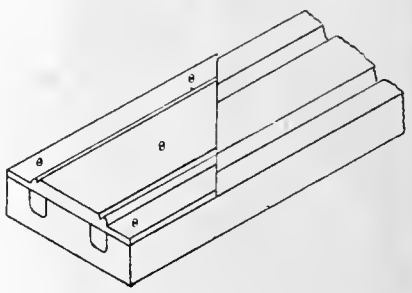

FIG. 36

with a thin lid or covering of wood, which may be plain or ornamental, and by this means the wires are held in the grooves, and, in conjunction with the fillet, wires of opposite polarity, are prevented from coming into contact with each other. A sample of casing and covering is shown in Fig. 36. In all cases the capping of casing should be *screwed* on. This method is simple, and permits of the easy removal of the capping for inspection, repair, or removal of the wire if required, nails being more difficult to withdraw when it is desired to remove the capping. Both iron screws and nails should be prohibited because of the tendency to rust when placed in damp places, whilst brass screws and copper nails are not thus affected. For large casing the covers should be screwed on at the centre as well as at the sides, and for the smaller casing the capping should be screwed on at the sides only. As we have already mentioned, the width of the casing, size of grooves, and width of fillet vary according

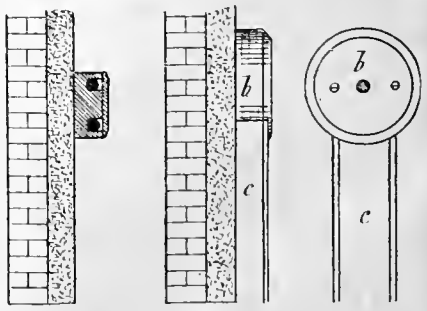

FIG. 37.

to conductor it has to carry, and we give here a short table as a guide to the size of casing to use for ordinary wires.

Conductors.	Casing.		
Size of Wire.	Wire.	Size of Groove.	Width of Fillet.
18	1¾in.	3/16in.	⅜in.
16	1¾	3/16	
7·20	1¾	5/16	¼
7·18	2		1
7·16	2¼		1
7·14	3		1
19·16	3¾		1¼
19·14	4¼		1½

In all cases it is a good plan to protect wood casing against moisture by coating it inside and out with paint, shellac varnish, or other waterproof covering. In damp places it is very essential that the wood casing be rendered waterproof, as the wood is liable to absorb moisture if this matter be not attended to. To fix the casing it is usual to mark out the run of the conductors and to plug the wall accordingly, the casing being screwed to the plugs or nailed by long French nails.

In practice there are three methods in which wood casing may be fixed. The first, known as surface work, is the cheapest, easiest to fix, and

FIG. 38.

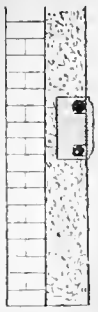

FIG. 39.

most accessible, and may be carried out in new or old buildings. It is called *surface work*, because it is fixed on the surface of the wall as shown in Fig. 37. It is evident, therefore, that this is the

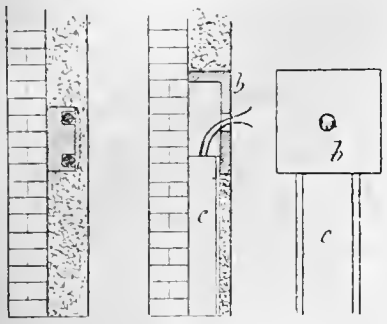

FIG. 40.

method which must be adopted when fitting premises in a finished condition, and in places such as warehouses, factories, &c., where the decoration of the rooms is not a question of importance.

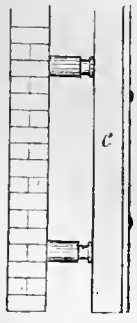

FIG. 41.

For other cases fancy moulded casing is used (see Fig. 38), and as this may be obtained to harmonise with the style of decoration, there is seldom little objection to its use.

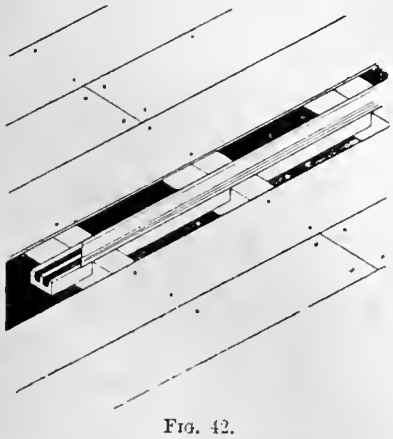

FIG. 42.

Should, however, a deep moulding be objectionable, the second method or *partially sunk work*, as shown in Fig. 39, may be employed. In this method the casing is sunk into channels cut in the plaster, or with new premises the casing is fastened by means of plugs on to the walls, and, as will be observed, the capping or covering appears as a thin strip of moulding on the wall. This method possesses the advantage of concealing the casing, and has a neat appearance, without losing the advantages as to accessibility.

The third method, known as *concealed work*, is shown in Fig. 40, and, as will be observed, the casing is fixed to the wall before the plaster is

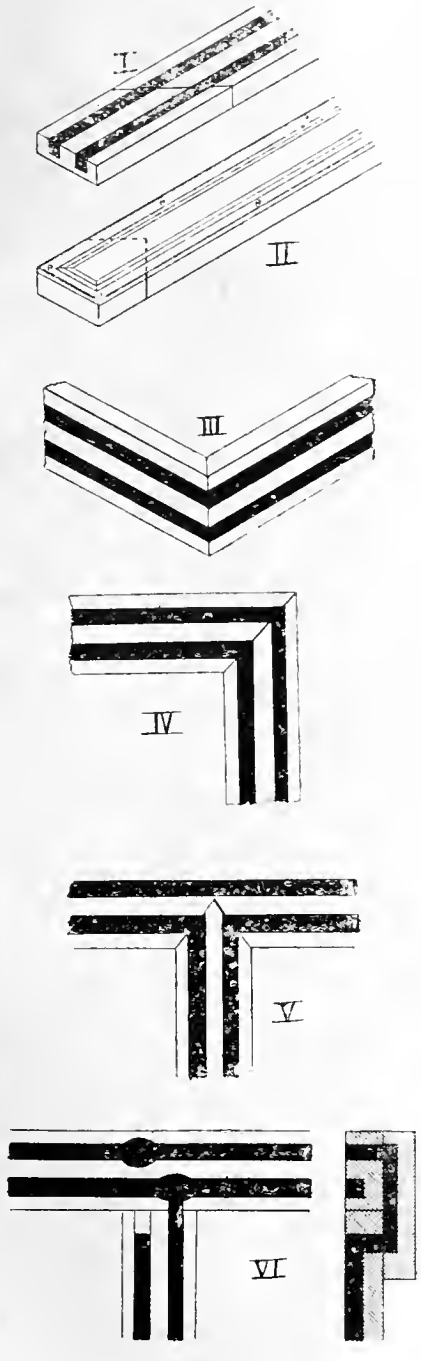

FIG. 43.

put on, the casing and capping being completely covered with the plaster. It is the method to be adopted where it is desirable to conceal the casing and covering, and can only be properly done during the construction of the premises. In some cases, such as the main branches, the size of the casing demands that the wall be grooved. The objections to concealed work are (1) the difficulty of inspecting the conductors or of making additions without disturbing the plaster, and (2) the necessity for using a larger size of casing, so that the wire may be readily drawn in or out when making repairs.

For premises in which work is done which gives rise to much dampness, as in breweries, for example, the casing is usually supported on insulators at a small distance from the walls, as shown in Fig. 41, by which means the casing is preserved and the insulation of the circuits improved.

Whenever electroliers are fastened to the ceiling, or lamps are suspended from the ceilings by flexible conductors, it is advisable to run the casing under the floor above rather than on the ceiling itself, and in this way the casing is concealed. The method of running the casing under the floor is shown in Fig. 42. In the case shown, the casing runs across the joists, in which case the casing is sunk into the joists, and it will be observed that the casing is fixed so as to be under the centre of the floorboard which covers it. There is, then, room for the board to be screwed (not nailed, so as to permit of the board being readily taken up for inspection, repairs, &c.) on either side of the casing. If the casing be not placed under the centre, there is every possibility of wet reaching the casing during the washing of the floors. If the casing is so large that the joists would be weakened by sinking the casing, as shown, it is usual to run the casing between the joists, and to groove or bore the joists for the wires. When it is necessary to run the casing parallel to the joists, the casing should be screwed to the side of the joists. In Figs. 37 and 40, wood blocks (marked *b*) are shown; to these the switches and fittings are fastened.

It will not be necessary here to explain the methods of joining and finishing off the casing. Figs. 43, I. to VI., however, are given as a guide to those not accustomed to carpenter's work, and we may add that it is a good plan to employ carpenters to run the casing and experienced wiremen to run the conductors.

(To be continued.)

SQUARE MEASUREMENTS.*

MUCH laborious calculation of an exceedingly irksome kind may be saved by Mr. Frank Trickey's "Tables of Square Measurements," just published by G. Pulman and Sons, of Thayer-street, Manchester Square, London, W. The volume is neatly bound, of a convenient pocket size, and is printed in clear type. Each page gives three columns of superficials, which show at a glance the number of square feet and inches in any given area from 2ft. 6in. by 1ft. 1in. to 35ft. by 25ft., advancing by inches. Mr. Trickey has found the value of such tables in the carpet trade, and others who deal in fabrics will welcome this useful ready reckoner, which will save time and insure accuracy. But the architect and surveyor, especially those who prepare quantities, will find Trickey's Tables of infinite value in the process of "squaring dimensions," by saving cross-multiplication, as well as in measuring surfaces of all kinds. For the manufacturer or salesman who wishes to make an estimate at short notice these tables will prove a great boon. Ordinary ready reckoners are only available for a few calculations; these tables of square measurement are absolutely necessary, not only to ordinary manufacturers and warehousemen, but to decorators, parquet-floor makers, and all trades in which square measurements have to be made. The price of the book is 2s. 6d.

SURVEYORS AS ARBITRATORS.

AT the ordinary general meeting of the Surveyors' Institution, held on Monday evening last, an interesting paper was read by Mr. A. A. Hudson (Associate) under the above title. The author began by saying that most surveyors were called upon at some period of their professional career to act either as witnesses in trials or arbitration for the settlement of disputes regarding building, surveying, or engineering operations. There was nowadays a strong feeling in favour of technical tribunals; but the advocates of such tribunals did not always pause to consider what would be the advantages and disadvantages of the tribunals which at present existed. Every litigant, unless he elected to go to arbitration, was entitled to have his case tried by a judge of the High Court and a jury; but when the action involved matters of accounts, it might be referred to an official referee. The very fairness of a trial before such a tribunal was frequently the cause of delay, for the judge felt bound to go into such details as would take a longer time than was

* Tables of Square Measurement. By FRANK TRICKEY. London: G. Pulman and Sons, Thayer-street, Manchester-square.

at his disposal, and thus the case was often either compromised or curtailed. Again, a judge was bound to look upon every witness as, *primâ facie*, a witness of truth, whereas, in an arbitration, the arbitrator often knew the value of a witness's evidence from personal knowledge of his practice. A judge disliked building cases because he had the task set him of reconciling what seemed to be inexplicable differences between expert witnesses, but a surveyor as arbitrator could soon resolve these discrepancies. It was for litigants to determine which procedure they preferred. If they chose arbitration, they must not complain that the relative value of their evidence could be easily weighed by the arbitrator; and if they chose trial in the High Court, they must be prepared to be cross-examined on points of credibility which the umpire would probably not have to inquire into. As to the expense, a judge received no fee from the litigants; but there were other expenses which did not occur in arbitrations. On the whole, the author thought the expenses of an arbitration were larger than those of a trial before the Court, or by an official referee. The most important element of expense and disadvantage of trials in the High Court was that parties could not arrange the trial at a date convenient to themselves, while an arbitrator was generally willing to meet their wishes in this matter. The expenses, especially in the case of country witnesses, were often very heavy when a case had to wait for the convenience of the Court, or was delayed from other causes. Again, it was frequently the case that in a matter of purely technical detail neither the judge nor the counsel concerned really understood the plans, sections, or any details of the work. These cases were in such conditions generally lost or won on small matters, due to the fact that those who had the trying of them could not, in the nature of things, have a technical knowledge of the details, and their broad bearing on the dispute. In the case of arbitrations before surveyors or architects, there could, in the first place be no question of knowledge of technicalities; but the question of the admissibility of evidence was sometimes a difficult one, and in some cases was only overcome by the appointment of a legal assessor. The converse method was for a barrister to sit as arbitrator with a surveyor or architect as assessor. There was, he thought, not much preference to be given to either method, for in effect arbitrator and assessor were really joint arbitrators. The Royal Institute of British Architects prescribed a form of contract by which, should occasion arise, an arbitrator was nominated by the President of that body, but he was not quite sure that an architect was the most suitable person to fill the position, for he was naturally a little biassed in favour of his client's side. A professional man acting as often on one side as the other, seemed to be the ideal arbitrator, who would bring to the settlement of disputes the widest views and greatest impartiality. The surveyor also had a much nearer acquaintance with the value of work done than the architect, who often interested himself only in the artistic, as distinguished from the business, side of the work. As one who had, before adopting his present profession, been an architect himself, the author disclaimed any intention to reflect on the body to which he was proud to have belonged, and wished to be understood as approaching the matter from an academical point only. A building owner was very safe if he made his architect's decision final, but would be safer still if he provided that an arbitrator of his own naming should decide all matters as a condition precedent to any claim. Under the London Building Act (section 107, Dangerous Structures) the arbitrator had only to decide between two surveyors, and it would seem not to be necessary to examine witnesses on oath. Litigants wanted in the first place that their case should be understood by counsel, solicitors, and judge, or arbitrator. Next, they required a decision on their strict legal rights. Again, they wished the time of trial to be so fixed as to suit their convenience; and, lastly, they sought economy and a probability of getting their reasonable costs. The last point was often a serious one, and the costs in trials before the High Court were seldom adequately recovered. The party and party costs were taxed, with the result that at present the plaintiff generally had to pay from 2s. 6d. to 15s. to recover £1. In a case where a contractor, for example, claimed £1,000, the balance of £10,000, it was quite possible that the quantity surveyor might have to measure the whole of the work, for which he must charge from £150 to £200. But the taxing masters did not recognise this. The Admiralty Court, which was a purely technical tribunal, fulfilled all the conditions necessary for the establishment, *mutatis mutandis*, of a court for the trial of building and engineering disputes. The procedure was simple: the date of the trial was fixed, the evidence was shortened, because experts could not give evidence on a matter within the knowledge of the assessors, and there was an opportunity, should occasion arise, of viewing the matter in dispute. This seemed to be the ideal to be aimed at in establishing a Court for the settlement of building disputes.

A discussion followed, in which Messrs. H. H. Collins, Howard Chatfeild Clarke, J. Douglass Mathews, William Woodward, and J. G. Head took part, and, on the motion of Mr. P. E. Pilditch, the further consideration of the paper was deferred to the next meeting.

CHIPS.

The Treasury have agreed to bear the expense of casting in bronze the colossal equestrisn statue, representing Energy, or Force, upon which Mr. Watts has been working for many years, and which he has expressed his wish to present to the nation. An admirable site for this has been found in Hyde Park, in the centre of the terrace at the foot of the Serpentine, and it is hoped that the statue will be placed in position with no unreasonable delay.

The directors of the Great Central Railway have let the contract for the construction of the branch railway, 8¼ miles in length, from Woodford Junction on the new London line to a junction with the Great Western Railway near Banbury, and possession has been obtained of sufficient land to enable the contractors to make an active commencement at the north end of the branch.

The master builders of Selby and district have discussed the advisability of forming a Master Builders' Association and joining the Yorkshire Branch of the National Federation of Building Trade Employers. The meeting decided to form a branch of the association and to join the Federation.

A new Sunday-school and Assembly Hall in connection with the Trinity Preabyterian Church, Corporation-road, Middlesbrough, was opened by the Mayor of Middlesbrough last week. The work has been carried out by Messrs. Perks and Son, builders, Stockton.

Among the passengers on the steamship *Calabar* which left Liverpool last week for West Africa was Mr. H. B. H. Chapman, Director of the Public Works at Lagos. Mr. Chapman is to stay at Sierra Leone for a short period, to ascertain and report on the possibilities of a water supply in that colony. Captain G. H. Stone, Assistant-Director of Public Works, is also proceeding by the *Calabar* to Sierra Leone. A new gaol is being erected at Sierra Leone, at a cost of £20,000. It is situated on the Kissy road, about a mile and a half from Freetown. Waterworks are also to be constructed at Sierra Leone, and will cost that colony about £30,000. These works will be the first erected in any British colony on the West Coast.

Monifieth Dean of Guild Court has issued its decision on the petition presented by Mr. James Tullis in connection with the proposed erection of ten semidetached cottages on the part of the Golf Links recently feued by him. The Court has dismissed the petition on the ground that the provisions of the Burgh Police (Scotland) Act, 1892, in regard to the new streets have not been complied with, that the plans do not provide for the proper drainage of the buildings proposed to be erected, and that the petitioner declines to satisfy the Court in regard to these matters.

A movement is on foot for improving the western entrance of Manchester Cathedral. The object aought to be accomplished is the provision of a covered approach to the cathedral, to be used on State occasions by ecclesiastical and civil dignitaries and public bodies. It is proposed to provide a west or "Victoria" porch, and a niche has been prepared for the reception of a statue of her Majesty, to which will be added, as funds accrue, figures of notabilities in Church and State. The total outlay is estimated at £6,000, towards which Sir William Cunliffe Brooks has promised £2,000.

At the annual meeting of subscribers to the Midland Counties Home for Incurables, held on Saturday, at Leamington, it was resolved that the first section of the work of extending the institution be proceeded with, at a cost of about £3,500, by the erection of a block at the western side of the present building, whereby accommodation will be provided for 33 patients. The joint architects for the extension are Mr. W. Hawley Lloyd and Mr. W. Henman, both of Birmingham.

BOOKS RECEIVED.

Second editions are to hand of *Fixtures*, by Sidney Wright; and *Dilapidations*, by A. T. Macer (London: *Estates Gazette* Office), both useful handbooks brought up to date.——Another volume of *Bell's Cathedral Series* is issued dealing with *Exeter Cathedral*. (London: George Bell and Son, York-street. 1s. 6d.) The compiler is Mr. Percy Addleshaw, B.A., who has produced a very readable monograph, and the illustrations are numerous and well printed.——*A History of Architecture for the Student, Craftsman, and Amateur*, by Banister Fletcher, F.R.I.B.A., Professor of Architecture in King's College, &c., and Banister F. Fletcher, A.R.I.B.A., Lect. on Architecture at King's College, &c. With 115 plates and other illustrations. Third edition; revised. (London: B. T. Batsford.)—We so recently noticed at some length this very useful textbook, which has already reached the third edition, that it will be sufficient to accord to it our welcome. The plan adopted by the authors, who are experienced instructors of the art, has been appreciated by those lecturers who have used the work: we mean the *comparative* and *analytical* method of treating the styles. Each style is analysed, and the parts and features contrasted, by which means the student is at once enabled to compare similar features in every style or period. Each of these is divided into five sections. The first deals with the influences which have been at work: geographical, geological, climatic, religious, &c. The second section deals with architectural character; the third gives the examples; the fourth treats comparatively of plan, walls, opening, roofs, columns, mouldings, and decoration, each of which is concisely stated, and the last section gives reference books. The plans, illustrations, collotype and others, are well selected. Professor Banister Fletcher and his son have compiled a most useful epitome of style in buildings treated scientifically, in which every important feature is taken account of, and in this respect it compares most favourably with those books which treat architecture in a more superficial manner, descriptive only of style. In this edition the authors have revised and added to the text, and given examples of Classic and Gothic mouldings. They intend to prepare a second volume treating of non-historical styles.——The last quarterly issue of the *Essex Review* (Chelmsford, E. Durrant and Co., and London, Simpkin, Marshall, and Co.), edited by Mr. E. A. Fitch, of Maldon, maintains its character as one of the best serial publications dealing with the history, antiquities, and current events of a county. Among the features of the number before us are a well-written article on the fine parish church of St. John the Baptist, Great Marton, illustrated with perspective, plans, and sketches by the author, Fred Chancellor, J.P., F.R.I.B.A., of Chelmsford; "Old Essex Deeds," by F. A. Blades," and "A Pleasant Holiday at Bradwell-on-Sea," by James Stewart.——*The Progress of Art in English Church Architecture*, by T. G. Robertson, with illustrations (London: Gay and Bird). A popular and non-technical book on Gothic architecture is a worthy achievement, but one that has hitherto failed. We know of a few books of this kind; but we are not sure whether they are read. People who have a smattering of the subject, and are fond of visiting our great churches, are content with the ordinary guide-books, mi-leading as they are. The author of this little volume has attempted to lay before the amateur and general reader the rudiments of the subject. He deals first with the early plan of a Christian church and its symbolic signification as the very root of the subject, instead of talking about origin of Gothic art, external features, and so on, as most writers have done. The type of plan (cruciform), orientation, and the origin of the deflection of the choir are noticed, and the author refers to the Babylonish origin of orientation. The Roman worshipped facing the east, as the Greek before him did toward the west. The early Christians also always prayed facing the east, and the author repeats the tradition that some churches were built to point to the sunrise on the days of saints to which they were dedicated. Several typical plans, as those of Westminster, York, Wells, Amiens, are illustrated. The subsequent chaptera deal with crypts, their origin as safe places for relics; the Revival of Gothic Art, in which Rickman's "Nomenclature of Styles" and Sharpe's "Classification into Seven Periods" are spoken of. The characteristics of the Norman, Early English, Decorated, and Perpendicular periods are described

by the aid of suitable diagrams and sketches, and chapters are added on "Notes on English Cathedrals," Scottish churches, also the difference of the Renaissance, and some remarks on a new style. The few notes on "Mason's Marks" are useful. The illustrations and sketches in some cases are scarcely up to the mark; but Mr. Robertson's manual will be found of service to the general student, who wishes to master the principles of the subject. There is a good index.

CHIPS.

The Redruth Union Infirmary is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves with descending smoke-flues, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Great Central Railway Company have deposited a Bill for next Session, by which powers are sought to construct 7 miles 2 furlongs of new railways in Middlesex, Nottinghamshire, and Derbyshire. Of these railways, over 6 miles are proposed to be constructed in Middlesex so as to enable the company to connect their line, now in course of construction through Willesden, with the Great Western Railway Company's line authorised last session through Ruislip. The remaining four projected lines are all under four furlongs in length, and form merely junction railways in Kirby-in-Ashfield, Worksop, and South Normanton.

The Old Kilpatrick School Board have just completed the erection of a public school in Elgin-street, Yoker, and it will be formally opened by Lord Overtoun next week. The school will accommodate about 1,200 scholars.

The Lerwick School Board received at their last meeting a report, with relative sketch plans, from Mr. Wilson, architect to the Edinburgh School Board, with reference to proposed enlargements of the present school accommodation in Lerwick. Some time ago Mr. Wilson visited Lerwick, and now submitted alternative plans. One of these provides for the erection of a new school on the site of the present central school, the whole buildings and teacher's house on which site would be demolished. The estimated cost is £4,300. It was also proposed to erect an addition at the back of the Anderson Institute at a cost of £1,400—in all, £5,700. The alternative plan provides for a smaller school on the central school site, and larger additions at the institute, the cost being the same. The meeting remitted the plans to a committee for report.

A Jubilee clock tower is about to be added to Kingswood Church, near Bristol, from plans by Mr. C. Mackay. The tower will rise from the ground, and will be of brick with stone dressings, and three dials, each 5ft. 6in. in diameter, will be provided.

It has been decided that the proposed memorial to the late Dean Montgomery, of Edinburgh, shall take the form of a recumbent effigy in marble, to be placed in St. Mary's Cathedral. The work is estimated to cost £1,000.

In addition to the £3,600,000 additional capital which the Midland Railway Company are seeking power to raise under a Bill for power to construct over thirty miles of new railways in Yorkshire, a second Bill has also been deposited by the same company for power to raise a further £2,000,000, which will be principally expended in the construction of over twenty-one miles of widenings on portions of their railway from Leeds to Skipton, Leeds to Bradford, Derby to Leeds, Sheffield to Leeds, Chesterfield to Sheffield, Birmingham to Derby, Syston to Peterborough, and at East Wigston in Leicestershire. These widenings will include an enlargement of their station at Sheffield.

A mural family memorial tablet of a novel character in the north has recently been placed in Fyvie Church Aberdeenshire, by Miss Chalmers, of Monkshill. Wholly executed in champlevé enamel, the tablet is about 3ft. in length by 2ft. in breadth—a large size for firing in one piece. The ornamental border is in blue and green, the body of the tablet has a golden ground, on which the lettering of the inscription appears in blue, black, and red, and there are three decorative initial letters in different colours. The tablet was designed by Mr. Pittendrigh MacGillivray, A.R.S.A., of Edinburgh.

The extensions at Meadow-lane gasworks, Leeds, which have cost over £30,000, are now nearing completion, and the new inclined retorts, which represent a further expenditure of £22,463, are expected to be ready for use about May. These new retorts will enable the gas committee of the Leeds Corporation to increase the output from the Meadow-lane works from 4½ million cubic feet a day to over seven million cubic feet. The introduction of these mechanical stoking appliances will also cheapen the production as well as relieve the workmen of much wearisome labour.

Engineering Notes.

CITY AND SOUTH LONDON RAILWAY COMPANY.—The report for the half-year ended December 31 states that since the last report very satisfactory progress has been made with the extension to Finsbury-pavement, but the works necessary for upholding the fabric of the church of St. Mary Woolnoth have caused considerable delay at that point. The difficulties have, however, been nearly overcome, and more rapid progress there will now be possible. Considerable progress has been made in the acquisition of the sites for the stations on the Clapham extension, and it is hoped very shortly to let the contract for the completion of that portion of the line. In order to utilise the portion of the present line between the Borough Station and King William street, which will be thrown out of use by the construction of the new extension, arrangements have been made with a new company, the City and Brixton Railway, to continue this part of the line from the Borough, *viâ* St. George's-circus, and Kennington-road, to Brixton-hill, and it is proposed that the new line, when completed, should be leased to and worked by the City and South London Company in conjunction with its present system. Provisional arrangements have been made for the construction of a subway to connect the platforms of this company's station at Lombard-street with those of the Bank Station of the Central London Railway, at the joint cost of the two companies. A Bill has been deposited by the directors the principal purpose of which is to obtain an extension of time for the construction of the line to the Angel, at Islington, authorised by the Act of 1893, and to authorise a short additional siding at Clapham-common, rendered necessary in connection with the station there.

It is proposed to erect, by subscription, a statue of the late Duke of Devonshire at Eastbourne, of which as a fashionable watering-place he was the founder.

The new post-office, Forfar, is approaching completion. It has a frontage to Castle-street of 40ft. and extends back 116ft. On the street floor is the public office, 20ft. by 20ft., and behind it are the post-master's room and sorting office, the latter being 42ft by 24ft. At the rear of the building the telegraph lineman's room and battery room are situated, together with the barrow shed and basket store. On the first floor are the telegraph instrument room, 20ft. by 16ft., telephone room, 12ft. by 11ft., and boy messengers' room. Mr. David Adamson, Yeaman-street, Forfar, is the principal contractor.

The Light Railway Commissioners have issued a draft order for the construction of a light railway from Postland, in Lincolnshire, to Peakirk, in Northamptonshire. The railway, which is for the benefit of the Crowland district, is to have a junction with the Great Eastern Railway at Postland, on the Spalding and March line, and with the Great Northern Railway at Peakirk, on the Peterborough and Spalding loop line. It is to be of the ordinary gauge. Hitherto, Crowland, famous for its abbey and unique triangular bridge, has had no direct railway communication, Postland, the nearest station, being five miles distant. The capital is fixed at £45,000.

A recent memoir of the Geographical Survey of England and Wales, dealing with soils and subsoils from a sanitary point of view, has been published by order of the Lords of the Treasury. Sir Archibald Geikie, Director General of the Survey, states that inquiries are constantly being made by the public for advice regarding the nature of the soils and subsoils of sites upon which house-building is contemplated. Accordingly, Mr. Horace B. Woodward, F.R.S., was instructed to prepare a treatise upon the subject, with especial reference to London and its suburbs.

The Mercers' Company and the Gresham Committee are having a niche prepared on the south wall of the ambulatory of the Royal Exchange for another mural decoration. This will make the fifth of the eight works which different donors have already promised. The subject of the new panel is an historical episode, "The Opening of the Royal Exchange by Queen Elizabeth, on horseback." The painting is the gift of the Mercers' Company, and the artist is Mr. Ernest Crofts, A.R.A. There are still twenty panels to be filled with subjects of historical events. The pictures are all painted in spirit fresco, a method invented by Messrs. Charles Roberson and Co. The colours ground in this medium are used in a similar manner to ordinary oil-colours on a specially prepared, highly-absorbent canvas which, when the picture is finished, is laid solidly on the wall.

Building Intelligence.

BATTERSEA.—The new municipal workshops which have been erected by the Battersea Vestry were formally opened on Saturday afternoon. The principal block covers a space of 280ft. by 25ft., and is built in two stories. On the ground floor there are a joiners' machinery department, an engine-room, a wheelwrights' shop, a forge for smiths and farriers, a harness-makers' room, and a painters' room. On the upper floor there is a joiners' shop, which has 12 benches, and lantern lights in the roof as well as side windows; a vanbody-makers' shop, and also departments for plumbers and smiths and fitters. Connected with the vanbody-makers' shop there is a lift which raises 30cwt. from the ground floor. The machinery includes circular-saw benches, a band saw, a planing machine, a copying lathe, a buffing machine for sand-papering the spokes, and a general wheelwright. There is a turning-lathe 14ft. long, a metal-drilling machine, a saw-sharpening machine, a mortise and boring-machine, a screw-cutting lathe, and a variety of other machines as well. The forge is a shop 50ft. long by 22ft. wide, where one finds at each end a patent self-contained blacksmith's forge, with cast-iron hearth and hood forming one piece, while in place of the familiar bellows there is a blast produced by means of a fan. The motive power for working all this machinery is supplied by an Otto silent gas-engine of 25I.P. The total cost of workshops and machinery is £8,000, but it is estimated that henceforward a saving of 10 per cent. will be effected by the vestry on all the work it does. The workshops were designed by the vestry's surveyor, Mr. J. T. Pilditch, and they are now in charge of the superintendent of works, Mr. Thomas Sheppard, who also looks after the whole of the men employed by the department, some 800 in number.

BIRKENHEAD.—A new Liberal club in Duke-street was opened on Friday by Mr. Asquith, M.P. The building up to the first floor level is of grey bricks, relieved with red pressed Ruabon bricks, and terracotta. From the moulded string-course up to the eaves the walls are finished with hand-set spar in cement. To the right of main entrance-hall is the staircase to the assembly-room. On the left is the smokeroom and reading-room. Directly opposite the entrance are doors leading into the billiard-room, and at the rear, on the ground floor, are the lavatories, committee-room, and back entrance. In the basement are the kitchen and heating-chamber. A mezzanine floor contains a ladies' and gentlemen's cloakrooms, lavatories, &c. On the upper floor is a hall capable of accommodating 400 people—platform 20ft. by 13ft 6in., and retiring rooms on each side of stage. The building will be heated by low-pressure hot-water pipes, and the incandescent light will be used. The sole contractor is Mr. George Snape, Birkenhead, and the designs are by Mr. T. Taliesin Rees, of the same town.

CHART SUTTON, KENT.—Upwards of a century has passed away since the parish church of Chart Sutton was destroyed by fire. In the year 1779, a thunderstorm, passing over the Weald of Kent, struck and ignited the spire of this church. Being of wood, the spire quickly fell on to the nave, and the church was all but demolished, the tower only remaining. The present inexpensive building was then erected, and hitherto had consisted of a nave only, the chancel and aisles of the old structure not having been rebuilt till the present time. The new chancel was dedicated on Saturday last. The work of restoration, which is being carried on by Messrs. James Wood and Son, of Boughton and Chart Sutton, comprises, in addition to the new chancel, vestry, and organ-chamber, several improvements to the nave. The internal walls are to be faced with stucco. The outlay will be £1,700.

KING'S HEATH.—The new Wesleyan church in Cambridge and School-roads, King's Heath, Birmingham, was opened on Friday last. The building, which is 80ft. long by 49ft. wide and 42ft. high, is divided into nave and aisles by three wide arches on each side, supported by red Aberdeen granite piers, with stone caps and bases. A transept projects on each side about 4ft. beyond the aisle walls, one transept being arranged for the organ and choir stalls, and a raised chancel, 18½ft. by 11½ft. deep extends beyond a moulded chancel arch, supported on

grey Aberdeen granite shafts, having moulded and carved caps and corbels. The floor is paved with encaustic tiles, and a high dado of glazed tiles covers the lower part of the walls. The east wall of the chancel has a five-light window, having a 12-light wheel in the upper part. This window has, at the sole cost of Alderman Bowen, who has carried out the building of the structure, been filled with stained glass from the studio of Messrs. Camm and Co., Smethwick. The pictures represent "The Last Supper," "The Nativity," and "The Ascension." The twelve lights of the "wheel" surmounting the three windows contain emblems of the twelve tribes of Israel, with a representation of angels attending the Saviour forming the centre. Below the window is an arcaded reredos, containing the Lord's Prayer, the Ten Commandments, and the Creed in letters of gold. These also are the gift of County Alderman Bowen. At the west end of the church is a gallery, backed by a window of tinted glass. The exterior is of red terracotta and brick, and the church has a spire. The general style adopted by Mr. William Hale, architect, is based on the Early English period. The woodwork generally is of pitchpine. The cost of altering the existing building and erecting the new structure has been £6,000.

Leeds.—The Standard Life Assurance Company are about to erect a large block of buildings on the site of the old post-office in Leeds. The company recently purchased the site from the Corporation for £19,950, and acquired the property at the rear with a frontage to Wine-street for £11,000. The preparation of the plans of the new buildings has been intrusted to Mr. Archibald Neill, 18, Cookridge-street, Leeds, and the work will be carried out under his supervision. The design is Classic in character. The façade will will be of stone, Bolton wood in the basement, and the remainder Portland. Internally, the accommodation will comprise between forty and fifty suites of offices. All of these, with the exception of about four suites, will be lighted from the front, which faces south. The main entrance to the building will be from City-square; the offices facing Park-row will have separate entrances. The basement will have an entrance at the lower side of the site. The various stories will be reached by an elevator as well as by staircases. Every apartment in the building will have its fireplace. Mr. Isaac Gould is executing the contract for the digging of the foundations, and building operations will ere long be commenced. The estimated cost of the structure is about £30,000.

New Brighton.—The New Brighton Tower, the highest spire in the United Kingdom, has just been brought to completion. The height from ground level to the burnished copper ball on the top of the flagstaff is 567ft., whereas the next loftiest structure—the Tower at Blackpool—rises to a height of but 518ft. 9in. The chimney at the St. Rollox Chemical Works, Glasgow, is 486ft. high, and the spire of Salisbury 404ft. The loftiest, of course, falls far short of the Eiffel Tower at Paris, which, it will be remembered, is 984ft. from ground level to summit. The tower at New Brighton is octagonal on plan, standing on eight legs, the base being 150ft. across. It is constructed of British mild steel, the weight of materials being 1,760 tons. The setting-out of the tower site was fully illustrated in our last volume. The architects and engineers are Messrs. Maxwell and Tuke, of Manchester, Messrs. Handyside, of Derby, were the contractors, and Mr. John Ashley, who was employed on the Blackpool Tower, was the clerk of works. At the base of the structure is a block of buildings some 90ft. in height now approaching completion. In this block is a theatre seated for 3,000 persons, and over this a concert and ball-room, a third floor, which has a glass roof, being arranged as a winter garden. The lifts are worked by electrical power generated at a station in the grounds.

Paisley Abbey.—An organised and determined effort is about to be made to restore the whole of Paisley Abbey. In 1862 the nave, which, though in a dilapidated state, had been used as a place of worship by the parishioners, was, after considerable expense, repaired and beautified. The transept and choir are partly ruinous. They are roofless with only their walls standing. Shortly before the Reformation the central tower, which had been built by the last Abbot of Paisley, also the last archbishop of the old church, fell from being insufficiently founded, and crushed in the choir and transept in its fall. The present movement to build up the ruinous part of the church has been promoted, in the first instance, by the congregation worshipping in the western portion, who have offered to subscribe £10,000 towards the scheme of restoration. Large subscriptions have been promised, and the scheme often mooted is likely at last to be seriously undertaken. Dr. Rowand Anderson, of Edinburgh, is the architect.

CHIPS.

An appeal is issued by the Dean of Gloucester for funds to add a solo organ to the instrument in Gloucester Cathedral, and some necessary stops. When the organ was restored in 1889, space provision was made for the desired addition, which can be made without altering the appearance or position of the organ. A sum of £650 is required to carry out the work. The original organ was built by Renatus Harris in 1662, and some of the stops were included in the recent restoration.

It was reported at the last meeting of the town council for Burton-on-Trent that the late borough surveyor, Mr. Swindlehurst (now the Coventry city surveyor), had presented a claim for £150 for service rendered in connection with his superintendence and control of the corporation contracts between June 9 and August 3. This was referred to a committee, who now recommended the payment of £63 in full settlement of the claim. The recommendation was agreed to unanimously.

Another arcade is about to be constructed in Leeds. It will extend from Lands-lane into old property at the rear, a distance of 64ft., then branch at right angles towards Upperhead-row, a distance of 162ft. Thus a new way will be available from Woodhouse-lane into Briggate. On the right and left of the new avenue will be shops—25 in all. Most of them will have a workroom or showroom over. The architects are Messrs. Ambler and Bowman, of Park-place, Leeds.

Sunday-schools are about to be added to Christ Church, Waterloo, Liverpool, from plans prepared by Messrs. Fry, Liverpool. The schools will be built of brick, on a site between Crosby-road and Sandringham-road, at a cost of £3,000 or £3,500.

A new Wesleyan chapel is being built in Cardigan-lane, Burley, Leeds. The estimated cost is £5,500. It is intended in a year or two to erect a Sunday-school adjoining. The architect is Mr. G. F. Danby, of Great George-street. From designs by the same architect, another chapel is being erected in Ladypit-lane, Holbeck. The cost will be about £1,100.

St. Michael's Roman Catholic Church, Abergavenny, has recently been enriched at the cost of Mrs. Ralph Clutton. Some years ago four of the lights of the large east window were filled with figures of the Blessed Virgin Mary, St. Joseph, St. Benedict, and St. Scholastica, the two outer lights and the tracery being left in the ordinary glass. Mrs. Clutton determined to complete the lights by the addition of the figures of St. Thomas of Canterbury and St. Margaret of Scotland, and as, since the original lights were erected, a stone reredos had been put into the church which destroyed the arrangement of the design of the glass, she has met the cost of altering the existing glass to suit the circumstances, as well as to defray the cost of the two new lights. The execution of these additions and changes was intrusted to Messrs. John Hardman and Co., of London and Birmingham.

The third extension, just finished, of the Southport Corporation Electric Works, brings up the capacity to fivefold what it was when, but three years since, the works were inaugurated. A fourth extension has been already set afoot, but even this will hardly overtake the estimated demand for next winter. The recent addition to the plant is a dynamo of the "ironclad" type, the alternators being placed on the periphery of the flywheel. The new dynamo is driven by a 500H.P. engine, and can supply 10,000 8c.p. lamps at one time, thus raising the total of the installation to 22,750 8c.p. lamps. The cost to date of the electric works has been £60,000, and the extension just commencing involves £21,000 more.

The experiments for the bacteriological treatment of the sewage of Oswestry, initiated some months ago by the borough surveyor (Mr. R. O. Wynne Roberts, C.E.), have attracted visits to that town by representatives of the sanitary authorities of Tarvin, Harrow, Wrexham, Lincoln, Hexham (urban and rural), Congleton, Nantwich, Chester (rural), Malpas, Morecambe, Atcham (rural), Hereford (county), Brooklyn, N.Y., &c.; and deputations from West Kirby, Wakefield, and Hamburg are expected to visit the works in a few days. The deputation from Hamburg, which will visit the works to-morrow (Saturday), will consist of the chief engineer, the assistant engineer, the chief M.O.H., the Port M.O.H., and Mr. H. A. Roechling, of Leicester.

COMPETITIONS.

Bushey.—A limited competition was held for the Royal Masonic Centenary Schools for boys about to be built at Bushey, and on the award of Mr. Rowland Plumbe, has been settled in favour of Messrs. Gordon, Lowther, and Gunton, architects, Finsbury, E.C. The cost will be about £100,000. Designs were submitted, we understand, by Mr. Alfred Waterhouse, R.A., Mr. Aston Webb, F.S.A., Mr. Basil Champneys, M.A., and Mr. John Morley, of Cambridge. Sir Arthur Blomfield, A.R.A., was invited, we are told, but declined, and the late Mr. C. J. Shoppee died before the competition came off.

Gillingham.—Plans by Mr. Fredk. Smith, architect, Bank Chambers, High-street, New Brompton, Kent, have been adopted by the Gillingham Urban District Council, in a limited competition for extensions to their present Technical Institute. The estimated outlay is £1,600, the additions consisting of new cookery school, manual instruction-room, and three large class rooms.

West Bangour.—The Edinburgh District Lunacy Board have invited architects to submit competitive designs in connection with the establishment of a lunatic asylum which they propose to build on the estate of West Bangour, in the parish of Ecclesmachan, Linlithgowshire, about two miles west of Uphall. It is intended, in the mean time, that accommodation will be provided for 600 patients, though suitable provision will be made for extensions whereby 1,000 will be accommodated. Only architects in Scotland who have been in practice on their own account for not less than two years will be permitted to compete. The architect selected by the board will be employed to carry out the work at the rates of remuneration and under the conditions contained in the schedule sanctioned by the Royal Institute of British Architects. If from any cause the buildings are not proceeded with, and no drawings other than the competitive drawings have been prepared, the selected architect shall receive a payment of £500 in full of all claims. In respect of the other competitive designs, four premiums will be paid in the following order:—£250 to the author of the design adjudged to be best by the architectural assessor; £200 to the author of the design placed second; £150 to the author of the design placed third; and £100 to the author of the design placed fourth. The board desire that the buildings should be of the most substantial description, and pleasing in character, but they do not wish that any considerable expense should be incurred in mere ornamentation.

At the Congregational Church, Shaw, Lancs, a new organ of 652 pipes, built by Messrs. A. Young and Sons, of Manchester, was opened on Wednesday week.

The new cemetery, which is to be purchased by the Huddersfield Corporation at Lockwood, will cover an area of over 22 acres. The land has been known as the Woodfield House Estate, and the purchase price is £4,750, including the buildings thereon, or 10d. per freehold yard.

According to the directors' last half-yearly report, work on the Bengal-Nagpur Railway extensions has been carried on vigorously. The rails have been laid from Sini, on the open line, to Midnapur, 99 miles, and from Kola, on the right bank of the Roopnarian, to the Subanarika river, 82 miles. The important bridges over these rivers are being pushed on as fast as possible.

A meeting of employers connected with the building trade was held in the Albert Hall, Morecambe, on Tuesday in last week, for the purpose of considering the advisability of forming a masters' association with a view of protecting their interests. Addresses on the advantages of federation were given by Mr. Tomlinson (Preston), secretary of the Lancashire Federation: Mr. Gartside (Chorley), and Messrs. Parker, Kidd, and Sharples (Longridge). After some discussion, it was decided that an association be formed, and a committee, consisting of Councillors J. Scott, J. H. Brear, J. Gardener, and Messrs. J. Escolme and A. Woodhouse was appointed to draw up rules.

About £14,000 is being spent on the rebuilding of Oxford-place Wesleyan Chapel and Sunday-school, Leeds. The front and one side of the old chapel have been taken down and replaced by more attractive elevations. This work has been carried out without closing the chapel. Not so the old Sunday-school, which has been demolished. The new school is nearing completion, and will be ready for occupation about May. Mr. G. F. Danby, of Great George-street, and Mr. W. H. Thorp, of Albion-street, both of Leeds, are the joint architects.

NEW OFFICES FOR MESSRS. RECKITT AND SONS, LIMITED, AT HULL.—CHAPEL, SEDBERGH SCHOOL.—NEW CHURCH, FLOCKBURGH.—THE FABLE OF "THE FOX AND THE CROW."—HOUSE NEAR HAWICK, N.B.—BUCKINGHAM PALACE MANSIONS, S.W.—BROMLEY COLLEGE, KENT.

Our Illustrations.

NEW OFFICES FOR MESSRS. RECKITT AND SONS, LIMITED, HULL.

THIS new block of offices, &c., is now in course of erection in Danson's-lane, Hull, adjoining the extensive starch and blue works of Messrs. Reckitt and Sons, Limited, having a frontage of 140ft. to Danson's-lane and 80ft. to Starchhouse-lane and New Parade respectively. The ground plan shows principal entrance from Danson's-lane leading into a spacious waiting-hall and a general office, 89ft. by 32ft. and 18ft. 6in. high, surrounded by the boardroom, private offices, cashiers' offices, auditors' room, travellers' waiting-room, type-writing-room, and clerks' dining-room, the latter arranged so that it can be added to general office accommodation when required. The strong-room, 31ft. by 14ft., and stationery-room, 14ft. by 10ft., are connected with general office by a short corridor. There is an entrance at the rear giving easy access to general office from the works. On the first floor a large dining-hall, 90ft. by 48ft., 13ft. high, is arranged for the use of the workpeople, with the necessary kitchens, &c., and is approached by separate staircase for men and women from the back road. The second floor, also the attic floor, is to be used for ware-house purposes. The buildings will be faced with red Ruabon bricks and Howley Park and Ancaster stone dressings, and roofed with green slates. The walls of strong-room will be faced inside with white glazed bricks. The inside lavatory walls will be tiled in plain tiles, while the walls of waiting-hall will be faced with faïence. The inside joiners' work will be executed in pitch-pine, but the entrance-hall and boardroom will be fitted up in mahogany. The floor of general office will be in wood blocks, while the waiting-hall and lavatory floors will be laid in mosaic. The back staircases will be built of solid stone steps and landings. The buildings will be lighted by electricity. The work is being carried out by the following contractors:—Brickwork, Mr. Benjamin Nicholson; masonry, Mr. G. H. Panton; carpenter and joiners' work, Messrs. Darneley and Son; slating, Messrs. Wilde and Son; plumbing and glazing, Mr. F. Oldfield; painting, Mr. G. Porter—all of Hull. The whole under the supervision of the architects, Messrs. Gelder and Kitchen, of 76, Lowgate, Hull.

THE SCHOOL CHAPEL, SEDBERGH, YORKS.

THIS chapel is designed with a con inuous nave and chancel without a chancel arch, which is somewhat a feature of the churches of Craven. The long line of roof is broken by a bell-turret of oak covered with lead, and the roofs are covered with stone slates. The nave is 82ft. long and 25ft. wide, and chancel 33ft. by 25ft. The arcades are low, with segmental arches, and fine square-headed windows in clerestory over; narrow aisle passages give access to seats at sides. The fine organ is contained in the north transept and aisle, there being a similar transept on south side seated for masters' families, &c., with choir and clergy vestries on east side. Local stone, with Prudham stone dressings externally, has been used, the interior facing being of flecked red Runcorn; pitch-pine roofs, and oak seats and fittings; wood block floors, flagged passages, and porches; chancel floor tiled. The sole contractors are Messrs. Brassington Bros. and Corney, of Settle. The architects are Messrs. Austin and Paley, of Lancaster.

FLOCKBURGH CHURCH

Is in the Early English style. It will consist of nave, 69ft. long by 22ft. 10in. wide; tower at west end, 26ft. 6in. by 25ft. externally, and 53ft. high, top of parapet. North and south aisles and organ transepts; at the east end of chancel will be a semicircular apse with stone groined roof. Advantage has been taken of the sloping site to form a vestry and heating cell under the apse and transept; access to chancel by north and south tower doors. Materials are for walling of local stone with Prudham dressings, in broken courses inside and out, except inside of apse, which will be ashlar. Roofs covered with stone slates, except aisles and apse, of lead. Roofs of pitchpine and seats of oak, wood block floors, and passages flagged; chancel tiled. Contractors: Masonry, A. Blair, of Allithwaite; carpentry and joinery, Messrs. Gradwell and Co., of Barrow-in-Furness; slater, J. Chippendale, of Grange; plumber and glazier, A. Moorhouse, of Kirkby Lonsdale. The architects are Messrs. Austin and Paley, of Lancaster, who are doing the work for Mr. Victor Cavendish, M.P., of Holker Hall.

STUDIES OF ANIMAL LIFE TREATED FOR DESIGN: "THE FOX AND THE CROW."

LIKE the previous illustration, given on Jan. 7, these studies were made with a view to decorative design. They assist in the ornamental rendering of "The Fox and the Crow" in linen damask. The drawings were made from the magnificent collection in the Natural History Museum at South Kensington. While it probably would have been more correct to have studied the Jackal as being the animal intended in the original fable, the common English fox was thought more in accord with the prevailing conception of the tale. Not only has the general outline in the different positions and the colour been rendered with a view to this purpose, but close attention has been given to the details, as will be seen in the drawings of the eyes, feet, &c., as well as the varying direction of the hair of the fox. These studies were awarded a silver medal in the national competition at South Kensington in 1897. They are examples of studies intended solely for use in designs, and not in any sense paintings of the animals, &c.; the contours and interior markings are distinctly defined, and the peculiarities of colour laid on in flat washes to diagramatically represent the delimitations of each tint, and not to exhibit the light and shade.

HOUSE NEAR HAWICK, N.B.

THIS house is situated about three miles above the town, on the right bank of the River Slitrig. The house, which stands considerably above the river, and commands fine views both up and down the valley, is built of whinstone, rough-cast on the exterior, with red Moat stone dressings to the windows, doors, gables, &c., while the roofs are covered with Tilberthwaite green slates. In accordance with the hilly nature of the site, the kitchen and offices are placed in the basement, with entrance on the north side, while the main floor (of which a plan is annexed), enters from the more level ground to the south. The upper floors are devoted entirely to bedroom accommodation: besides the usual fireplaces, the house is heated throughout with radiators. A lodge has also been erected at the entrance to the grounds, together with stabling and coachhouses, and a bridge over the river. The architect is Mr. James P. Alison, of Hawick.

BUCKINGHAM PALACE MANSIONS.

THE illustration shows the perspective view of this block of residential flats and shops, which occupies a very magnificent position with a frontage to James-street, Buckingham Gate, Westminster. The building is faced with T. L. Laurence's red bricks, and Portland stone dressings. The carved brickwork (by Mr. Gilbert Seale) and the roofs are covered with green slates, and the dormers are in copper. The contract for the building (exclusive of the decorating and electric lighting), has been let to Mr. J. J. Hall, contractor, of Dover, for £21,000, and Mr. Charles James Chirney Pawley, of Westminster, is the architect.

BROMLEY COLLEGE, KENT.

THIS is a charitable institution, founded by John Warner, Bishop of Rochester, in 1666, for twenty poor widows of clergy. The original building (as shown on the sketch plan) consists of rooms arranged round a quadrangle with a covered way. A second quadrangle was added in 1791—1805, providing accommodation for twenty more widows, thus bringing the total number up to forty. The chapel in the central part was rebuilt about thirty years ago, and has no architectural interest. The main front, forming the subject of these drawings, is the only part that contains much detail. The wings projecting forward form residences for the treasurer and chaplain, and the stone archway in the centre gives access to the quadrangle, although there are side entrances as well. It is said that the bricks used in the old buildings were brought from London (8½ miles distant) after the Great Fire, and they have weathered a deep red; they run about four courses to the foot. All roofs are tiled. The dormer windows are modern: the other windows are casements with transoms and mullions, and are extremely plain in detail. The buttresses, an unusual feature in buildings of this style, are only used in the old college. Tops and set-offs are moulded. The eaves-course is continued round the outside of the whole building, but dentils occur only along the front and for 40ft. on each side. It is of wood, covered with lead, and has a modern iron gutter partially hiding the top members. The front doors and windows, on the return of the wings to the chaplain's and treasurer's houses, have external wooden painted architraves, with stone steps and projecting wooden hoods. The central archway is of Portland stone, and the entrance gate, of iron with stone piers, opens on to Bromley High-street. The inscription over the archway in centre is as follows:—

DEO ET ECCLESIÆ
This College for Twenty poore
Widdowes (of Orthodoxe & Loyall
Clergymen & a Chaplin was
Given by John Warner late Ld
Bishop of Rochester
1666.

—R. H. ERNEST HILL.

The widening of the London and South-Western Railway main line from Woking to Basingstoke has commenced, and the first section of the work from Short Lane to Farnborough is now in hand.

A stained-glass window has been placed in the west end of Yarpole Church, Herefordshire. The subject of the central light is "The Good Shepherd," and in the side lights are depicted "St. Cecilia" and "Charity." The artists are Messrs. Jones and Willis, of London and Birmingham.

The Young Men's Christian Association Institute in Gateside-street, Hamilton, N.B., was opened last week. The institute, which is a three-story building, and erected to plans by Mr. Alexander Cullen, F.S.A., Hamilton and Motherwell, contains on ground floor a hall, committee-room, and cloakrooms; and on the first floor reading-room, library, and caretaker's house: while the upper flat is to be let as dwelling-houses, disconnected with the Association rooms. The cost has been £1,600, not including furnishings.

The Bishop of London has expressed his readiness to preach at the dedication of the Monk Memorial Chapel, St. Matthias, Stoke Newington. The south chancel aisle is now in process of embellishment by Mr. D. Bell, and will, it is hoped, be finished by the anniversary of Dr. Monk's death. The cost of this memorial is borne mainly by one generous layman, who also presents a costly reredos.

Last week a new spire to the parish church of Greatham, Hants, was dedicated by the Bishop of Winchester. This addition is the gift of the owner of Le Court, Mr. Heath Harrison, in order to perpetuate the Diamond Jubilee of the Queen. The new spire represents an addition of about 70ft. to the tower at the eastern end of the church, which is now rather more than 100ft. high. There are four two-light belfry windows, with slate lappers, Gothic heads, carved bosses and columns, and the masonry has been built of Selborne stone with Bath stone dressings. The spire is built entirely of English oak covered with oak boardings and shingles. The plans were prepared by Mr. F. Chancellor, of Finsbury Circus.

THIS CHARITY WAS FOUNDED BY JOHN WARNER BP OF ROCHESTER IN A.D. 1666 FOR TWENTY POOR WIDOWS OF CLERGYMEN. THE ORIGINAL BUILDINGS ARE OF RED BRICKS SAID TO HAVE BEEN BROUGHT FROM LONDON AFTER THE GREAT FIRE, AND THE ARCHWAY IN CENTRE IS OF PORTLAND STONE. A SECOND QUADRANGLE WAS ADDED IN 1794-1805 PROVIDING ROOMS FOR TWENTY MORE WIDOWS. THE WOODEN EAVES CORNICE IS CARRIED ROUND THE WHOLE BUILDING, BUT THE DENTILS EXTEND ONLY 40 FT ALONG THE SIDE ELEVATIONS, AND ONLY THE OLD PORTION HAS BUTTRESSES. WITH THE EXCEPTION OF THE PRINCIPAL FRONT THE BUILDINGS ARE QUITE PLAIN. ROOFS ALL TILED WITH NARROW LEAD FLAT AT EAVES.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

THE ARCHITECTURAL ASSOCIATION OF IRELAND.—A meeting of this association was held in the Grosvenor Hotel on the 18th inst, Mr. J. Howard Pentland, R.H.A., F.R.I.B.A., in the chair. Mr. Anthony Scott, M.S.A., delivered a lecture on Mellifont Abbey. The lecturer dealt most exhaustively with the subject of this Cistercian foundation. He illustrated his remarks with numerous sketches and measured drawings by Mr. Scott, jun. Mr. Scott entered on a comparison and analysis of the plans of Mellifont and contemporary Cistercian Abbeys of France. Mellifont boasts a remarkable feature in the shape of an octagonal detached building, generally supposed to be a lavabo or a baptistery. The lecture was also illustrated by a large number of lantern views from photographs taken by the members on the annual excursion.

THE EDINBURGH ARCHITECTURAL ASSOCIATION.—The members of this association visited Glasgow Cathedral on Saturday afternoon on the invitation of Mr. T. L. Watson, architect, Glasgow, who had asked the members to join others interested in the visit, which was made with a view of examining the lower church by the aid of artificial light. On arrival the party proceeded to the sacristy, where Mr. Thomas Ross, president of the association, took the chair. Mr. Watson read a paper, illustrated by sheets of mouldings and plans, expressing in full manner his views on the date and design of the vaulting of the lower church. In introducing his subject Mr. Watson said he was surprised to read in the preface to the third volume of Messrs. MacGibbon and Ross' valuable work on "The Ecclesiastical Architecture of Scotland" as follows:—"Reference is made in Vol. II. to Mr. T. L. Watson's theory regarding the vaulting of the lower church in St. Mungo's Cathedral, Glasgow. Having recently had the privilege, on the invitation of Mr. P. Macgregor Chalmers, of attending a meeting on the spot, when the usually obscure edifice was well lit up, and when it was shown by Mr. Chalmers that the points on which Mr. Watson based his opinion were untenable, we see no reason to believe that the beautiful design of the vaulting and the plan of the shrine were ever intended to be carried out in a mode different from that in which they are executed." Mr. Watson pointed out that the vaulting of the choir and lower church was of five distinct dates, and these were marked by five different sections of vaulting ribs. As the vaulting ribs of the middle compartment of the lower church were of a later section than those used in the choir vaulting, Mr. Watson urged that the design of the middle compartment vaulting must have been altered, and proceeded to bring forward further detailed proof in support of his contention. The exposition of Mr. Watson's views was followed with much interest, and at the conclusion the party descended to the lower church, which was well lighted by lamps. Mr. P. Macgregor Chalmers, who holds the vaulting to be generally all of one date, vigorously supported his opinion that the original design had been carried out. An animated discussion followed, which was taken part in by Messrs. Ross, MacGibbon, Keppie, John Watson, and Professor Baldwin Brown. At the conclusion of the examination Mr. MacGibbon said he saw no reason to alter the views expressed in the preface already quoted. Mr. Ross moved a vote of thanks to Mr. Watson for the trouble he had taken in this matter, and this was seconded by Mr. Chalmers.

NOTTINGHAM MASTER BUILDERS' ASSOCIATION.—The seventh annual meeting of the above association was held on Tuesday week at the chambers of the association, Bentinck-buildings, Wheeler-gate, when Mr. James Wright, the vice-president, presided. Mr. Frank Hodson, honorary secretary, and Mr. J. W. Woodsend, the treasurer, respectively presented their reports of the past year's work and finances, both of which showed that the association was in a progressive and solvent state. The hon. secretary, while congratulating the members on the continued activity in the building trade, regretted the restless state of the labour market, and stated that notices had been received of further demands from the masons and labourers for an increased wage and shorter hours. The following gentlemen were unanimously elected as officers for the ensuing year:—Mr. James Wright, president; Mr. William Edgar, vice-president; Mr. J. W. Woodsend, treasurer; Mr. Frank Hodson, hon. secretary.

ST. PAUL'S ECCLESIOLOGICAL SOCIETY.—The nineteenth annual report of this society, to be submitted at the meeting of members to be held in St. Paul's Chapter House, E.C., to-morrow (Saturday) afternoon, states that during the past twelve months eight meetings have been held at the Chapter House, and papers have been read by Mr. J. T. Micklethwaite, Mr. W. H. St. John Hope, Mr. J. Ninian Comper, the Rev. Canon Benham, Dr. J. Wickham Legg, the Rev. T. Olden, Mr. Cuthbert Atchley, the Rev. Fr. Robinson, and the Rev. Duncan MacGregor. An exhibition of objects of ecclesiological interest occupied one evening. Afternoon visits were made to the Charterhouse; to the churches of St. Stephen, Walbrook; St. Swithin, London Stone; St. Mary, Abchurch, and St. Saviour's, Southwark; to Hampton Court Palace, and to Pulborough Church, Sussex, and the neighbouring Hardham Priory. During the past year the society has had occasion to deplore the loss by death of several vice-presidents, including Dr. Walsham How, late Bishop of Wakefield, and Dr. Sparrow Simpson, who in the early days of the society took an active part in forwarding its interests. The council offer their congratulations to the newly-appointed Bishop of Bristol, and tender him their thanks for the services which he has rendered to the society during his residence at St. Paul's. The balance-sheet is of a satisfactory character.

CHIPS.

The first annual supper of the recently formed Master Builders' Association of Peterhead was held in the Palace Hotel on Thursday evening in last week. Mr. William Stuart presided, and Mr. John Ferguson, plumber, acted as croupier. Ex-Bailie Fraser, architect, and Mr. Geils, burgh surveyor, were present as guests of the association.

The Duke and Duchess of Fife will perform the ceremony of reopening the Hackney Town-hall on February 9. The building has recently been enlarged by the addition of two wings.

The new Liberal Unionist Club in Edleston-road, Crewe, was formally opened on Saturday last by Lord Arthur Grosvenor. The club is erected on the site of the old building, the foundations of which gave way in the autumn of 1896. Some structural alterations were in progress at that time, when, without any warning, about 5.30 in the morning, the whole building collapsed. It has now been rebuilt from plans by Mr. Joseph Cawley, of Northwich, the contractors being Messrs. Rylance and Sons, of the same town.

An inquiry was held at the Audit House, Southampton, on Tuesday in last week by Col. H. C. Luard, relative to an application by the Southampton Corporation for powers to borrow the sum of £1,080 for the purpose of erecting public conveniences in the High-street and Chantry-road. The borough engineer, Mr. W. D. G. Bennett, and Mr. Killick, assistant engineer, explained the plans and specifications.

A public inquiry was held at the town-hall, Warminster, on Friday, into the application made by the urban district council to the Local Government Board for sanction to the borrowing of a loan of £5,000 for sewage works and sewage disposal on the septic tank system for the town. Colonel Coke conducted the inquiry. Mr. A. F. Long, surveyor to the council, produced the plans and estimates, which were supported by Mr. Martin, one of the patentees of the septic tank system. Evidence in opposition to the scheme was given by Mr. A. P. I. Cotterell, A.M.I.C.E., of Bristol.

The urban district council of Sevenoaks have received from Col. Bevington a valuable collection of prehistoric implements found in the district during the past seven-and-twenty years.

Mr. A. E. Sandford Fawcett, C.E., F.G.S., of 1, Victoria-street, S.W., has been appointed a temporary engineer inspector at the Local Government Board, and Messrs. John Taylor, Sons, and Santo Crimp, of 27, Great George-street, S.W., have taken over the practice.

Work has been commenced this week on the new sea wall and beach gardens at Great Yarmouth.

The markets committee of the Newcastle Corporation have recommended the town council to spend £7,000 for the purpose of building a new roof in the wide alley of the market, and to renovate the present stalls in the book and poultry department.

At the town hall, Burnham, Somerset, on the 20th inst. Colonel Slacke, R.E., held an inquiry into a proposal by the urban district council to borrow £7,000 for the erection of a new sea wall, the provision of shelters, and erection of public conveniences at Burnham. Mr. W. J. Press, surveyor to the urban authority, explained the plans.

A Wesleyan church has been erected at Acrefair—a mining village midway between Llangollen and Ruabon—at a cost of £1,000, and the opening ceremony took place on Saturday. Mr. J. W. Jones, Brooklea, Acrefair, was the architect.

The Bill for powers to construct, at a cost of £1,225,734, an electric underground railway, connecting Charing Cross, *viâ* Knightsbridge, with Paddington terminus, has been officially marked dead at the Houses of Parliament.

Mr. A. Harry Heron, A.R.I.B.A., of 27, Fitzroy-street, Fitzroy-square, London, W., has taken Mr. Clifford Bellairs into partnership as from Jan. 1, 1898, and the style of the firm will be Heron and Bellairs.

A new hall in connection with the Presbyterian Church of England, Armstrong-road, New Benwell, was opened for public worship on the 20th inst. It is seated for 450 persons, and has been built from plans by Messrs Badenoch and Bruce, of Newcastle-on-Tyne.

The city engineership of Liverpool, the salary for which will commence at £1,000 per annum, is being eagerly sought for by engineers of the country, says the *Liverpool Mercury*, as is evidenced by the fact that between 50 and 60 applications have been received for the post, which has been rendered vacant by the resignation of Mr. H. Percy Boulnois, now an inspector under the Local Government Board. These are to be tabulated, and will shortly be considered by a committee of the corporation.

The Keene Memorial Tablet at Hammersmith Public Library, which we illustrated a fortnight since, was erected by public subscription, Mrs. Edwards, of Golden-square, acting as hon. secretary. Mr. Passmore Edwards gave the twin table to the memory of Leigh Hunt.

The Maidstone Town Council resolved, at their meeting on Wednesday, to apply for an Act of Parliament for the purchase of the Waterworks. Counsel's opinion was read to the effect that the corporation had no right of action against the water company, but that persons whose illness was directly caused by polluted water had that right. Several fresh cases of typhoid have been notified in the past fortnight, this increasing the aggregate to 1,910.

The town council of Haddington resolved on Tuesday to instruct Messrs. Carfrae and Belfrage, engineers, of Edinburgh, to prepare plans and advise them on the construction of a new bridge across the Tyne between Haddington and Nungate.

The Islington Vestry have decided to spend £8,500 in laying out the land at the Islington Cattle Market, recently purchased from the Corporation of the City of London for the purpose of a public park.

Mr. William Fletcher, brick manufacturer, Carlton-villa, Lostock, was driving home on Friday night, and upon getting off his trap the reins became entangled about his legs, and he ran forward. The horse backed in an opposite direction, and Mr. Fletcher was thrown to the ground. He was picked up in an unconscious condition, and expired at midnight. He was 47 years of age, married, and leaves a family.

The annual meeting of the Aberdeen Master Plasterers' Association was held in the office of the secretary, Mr. Thomas A. Coats. The chair was occupied by Mr. Alexander Baxter, president of the association. The following appointments for the current year were made—viz., president, Mr. A. Baxter; vice-president, Mr. David Scott; secretary and treasurer, Mr. Thomas A. Coats, S.S.C.; finance committee, Messrs. A. Baxter, David Scott, and David Stephen.

The temporary church of St. Margaret is now in course of erection on a site adjoining Cardigan Villas, on the east side of Cardigan-road, Leeds. The building is 70ft. long by 32ft., and will accommodate about 300 people. Clergy and choir vestries are provided. Messrs. Smith and Tweedale, of Leeds, are the architects.

The Main Drainage Committee of the London County Council report that during the year ended December 31 last 46,494 and 33,373 million gallons of crude sewage were treated at the Barking and Crossness outfall works respectively, together making a total quantity of 79,867 million gallons, or an average of nearly 219 million gallons per day. During the same period 1,408,000 and 697,000 tons of sludge were sent to sea from the respective stations.

At the special memorial service for the late Prince Henry of Battenberg, held on Thursday in last week at Whippingham Church, the Florentine screen, designed by Mr. Alfred Gilbert, R.A., M.C.V.O., was unveiled. It is of wrought iron, and is placed between the chancel and memorial chapel. It is decorated with four Royal shields, bearing the arms of the Queen, the Prince Consort, Prince Henry of Battenberg, and Princess Henry of Battenberg; the shields are in silver, and the metals and tinctures are in enamel.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

ROLLERS FOR GRANOLITHIC WORK.—A subscriber wants the address of makers of above. Says he has seen an advt. of such in our pages some time, but fails to find it. If makers write to us, we will send him on name and address. We may point out that there is scarcely a week in which we are not thus asked for addresses, and wonder very much that more do not avail themselves of our "Directory," which was intended to give the help thus sought.

RECEIVED.—M. G. R.—H. T. T.—F. H.—O. G. and Co.—L. T.—W. T. F.—N. G. (Salford).

Correspondence.

SINGAPORE TOWN HALL COMPETITION —A DISCLAIMER.

To the Editor of the BUILDING NEWS.

SIR,—My attention has been called to a notice under "Prize Competitions" in your issue of 21st inst., giving my name in connection with a Singapore town hall competition.

I write to say that I am not in any way connected with this competition, and cannot undertake to answer inquiries, and I shall be much obliged if you will give every publicity to this fact in your next number.

The notice in your paper should not be repeated, as it has been inserted without my knowledge or consent—in fact, early in November I declined to associate myself with this concern owing to the, in my opinion, incomplete and unsatisfactory nature of the competition arrangements made by the local committee.—I am, &c.,

M. A. CAMERON.

Downing-street, S.W., Jan. 26.

THE INTERNATIONAL BUILDING TRADES EXHIBITION.

SIR,—I am constantly receiving inquiries as to the Building Trades Exhibition, which your readers presumably think is to be held in March of this year.

Will you kindly allow me to state that this exhibition will not be revived until March, 1899?—I am, &c., H. GREVILLE MONTGOMERY.

43, Essex-street, Strand, W.C., Jan. 24.

A CORRECTION.

SIR,—I have only just noticed that in your report (in last week's issue) of the case of "Brooks' Trustees v. the St. Pancras Guardians," I am described as a partner in this firm. This is not so, nor, in my evidence, did I so describe myself; I am a manager and buyer—not partner.—I am, &c., W. J. RENSHAW.

Warren-lane Works, Woolwich, Jan. 22.

CHIPS.

The president of the Local Government Board has appointed Major-General C. P. Carey, R.E., Chief Engineering Inspector, in the place of Major Tulloch, C.B., R.E., who has retired. Colonel J. O. Hasted, R.E., has been appointed Deputy Chief Engineering Inspector.

The sixth annual dinner of the Shrewsbury and District Master Builders' Association was held on Wednesday evening in last week at the Lion Hotel, Shrewsbury. Mr. H. Farmer, the president for the year, occupied the chair, and Mr. W. T. Williams, the vice-president, was in the vice-chair.

The Birmingham Board of Guardians adopted at their last meeting plans for an additional building to accommodate female epileptics at an estimated cost of £4,485, and for adopting the cell system in the tramp wards at a further estimated cost of £2,235.

Business was again very quiet last week at the London Auction Mart, the returns falling below those of the corresponding week not only in last year, but also in 1896. This was due to the small supply of properties, for otherwise there was a tendency towards improvement in the demand for houses and land generally. The principal transaction of the week was in regard to a freehold public-house on the main Haverstock-hill, which realised £4,800. Altogether the returns amounted to £16,000, which falls short of the corresponding week in last year by £1,450.

The Bramley parish church organ, which has been entirely rebuilt by Mr. J. J. Binns, of Bramley, was reopened on Friday. Additional bellows have been added, also a new hydraulic engine, and a new system of heating apparatus. The pipes have all been revoiced, and new stops added. A new oak screen (to the west arch) has been presented by Mr. Binns as a Jubilee memorial.

The Primitive Methodist chapel in West-street, Boston, Lincolnshire, which was destroyed by fire on January 28 in last year, having been thoroughly rebuilt and restored, has been reopened for public service. The contract for the exterior work and for the painting and plastering was intrusted to Mr. W. Greenfield, and for the woodwork in the interior to Mr. C Jessop. Mr. T. Howdill, of Leeds, was the architect. A new organ has also been supplied at a cost of £250 by Messrs. Hewitt, of Leicester. The chapel provides seating accommodation for 800 persons.

New British schools at Truro were opened last week. They occupy a site on Chapel Hill, and accommodate 450 children. Mr. Silvanus Trevail, of Truro, was the architect, and Messrs. Clemens and Battershill took the contract at £1,682, exclusive of fittings and fences.

Messrs. Hill and Co., contractors, of Gosport and Portsmouth, have this week taken over from the Admiralty the work of completing the construction of a new breakwater, extending from Bincleaves, at Weymouth, to the existing one at Portland, thus forming a complete basin for ironclads to anchor within. The work will extend over a period of 4½ years, and the contract price is something like half a million of money. There are two entrances to the new breakwater.

Sixty applications were received for the post of assistant chief engineer to the Bristol Docks Committee. Mr. Thomas Arthur Pearce, whom the committee have decided to recommend to the council for appointment, is 33 years of age. His first training was as a mechanical engineer to the firm of Messrs. W. Collier and Co., formerly carrying on business at Salford. He was afterwards engaged on the Manchester Ship Canal works.

At Southampton, on Monday evening in last week, the members of the firm of Messrs. F. and J. Young, builders and contractors, on the occasion of the completion of the new offices and building works, Upper Clovelly-road, invited several friends and the whole of their employés to a dinner. A large company assembled in the principal workshop, which had been tastefully decorated for the occasion. The chair was taken by Mr. Councillor C. Thomas, J.P., who was supported by Messrs. F. and J. Young.

Intercommunication.

QUESTIONS.

[11886.]—**Board of Trade Appointments.**—Can any of your correspondents say what are the functions of those private practitioners whom one now and then sees announced as "having been appointed surveyors and arbitrators to the Board of Trade"?—INQUISITIVE READER.

REPLIES.

[11884.]—**"Red" and "Yellow" Deal.**—These are different names for the wood of the same description of tree—viz., the Scotch fir or *Pinus sylvestris*. Some classes of people—as timber merchants, and some builders, carpenters, and joiners—call the wood red; others, mostly of the latter class, but in other parts of this country, call it yellow. It varies much in quality, according to age of tree, latitude of country of growth, soil level, and aspect of place of origin, and many other local circumstances. Some of it is coarse, thick-grained, dense, and heavy, and fit for timbering; some is fine, straight-grained, and mild, suitable for joinery. And there is every intermediate variety of quality. The timbering quality may be obtained from Memel, Riga and Dantzic and the Northern ports of Sweden, that from the first three ports being the best. In the balk state it is generally called "fir," but it is from the same botanical tree. The best mild joinery deals are obtained from the White Sea ports—from Petersburg, from Finland, and some of the Swedish ports. As to the use to which any particular quality may be adapted, that is a matter of judgment. Almost all the qualities have their particular defects—as cross grain, sapwood, "heart," "cup," and "star" shakes, "decayed" and "ring-galled" knots. Why not read Stevenson's "Wood and its Constructive Uses" London: Batsford), as recommended by a correspondent in reply to Mr. D. Forbes Smith's letter? The subject is too large and complicated to be further pursued in these columns.—A. H.

A memorial obelisk has been placed over the grave of Coventry Patmore, the author of "The Angel and the House," in the cemetery at Lymington.

Colonel A. Smith, of the Local Government Board, held an inquiry at Doncaster, on Friday, as to the corporation borrowing £1,250 for the purchase of land for street improvements, the corporation proposing to sell consols for the amount, and to repay the money by instalments in fifty years. The town clerk explained that the street proposed to be widened was one used as the return route from the course to the station during the races. There was no opposition.

The watching and lighting committee of Glasgow Corporation passed plans, on Friday, for the new fire brigade station, which is to be erected on the site of Newsome's old circus in Ingram-street. The building is estimated to cost £40,000.

In response to an application by the Northwich Rural District Council for sanction to borrow £520 for works of water-supply for the townships of Cuddington, Hartford, and Weaverham, Mr. Robt. H. Bicknell, inspector under the Local Government Board, held an inquiry at the Sandiway Hotel, near Northwich, on Friday.

The ceremony of opening the new swing bridge at Swansea was performed on Thursday in last week by Lady Jenkins, wife of Sir John Jones Jenkins, chairman of the Harbour Trust. The bridge, which crosses the River Tawe to St. Thomas and Prince's Dock, has been constructed at a cost of £30,000. The Harbour Trustees afterwards paid an official visit to the new works in connection with the extension of Prince's Dock, which cost £100,000, and the new works of the extensive dry dock, costing £60,000.

At a Consistory Court held in York Minster on the 20th inst. a faculty was granted to the vicar and churchwardens of Whitgift to take down the chancel and schoolroom beyond, to build a new chancel, to re-floor, re-seat, and re-fit the nave and aisles, to re-fix the present pulpit and font, to form a vestry at the west end, and to make other alterations.

Beech Grove Congregational Church, Newcastle-on-Tyne, was opened by the Rev. Dr. Joseph Parker on Tuesday. It has been built by Mr. G. H. Mauchlen, contractor, from designs by Mr. Stephen Piper, architect, Newcastle, selected in open competition. The foundation-stones were laid on Oct. 14, 1896. The contract price of the building was £8,000, and the church provides accommodation for 750 adults, allowing 20in. to each person. The fittings are of pitch-pine. The lecture-hall, which was erected before the church was begun, is at the north end of the site, and there are also classrooms and caretaker's apartments, &c. The contractors were: masonry, carpentry, joinery, and plastering, Mr. Mauchen; slating, Messrs. Beck and Sons; painting, Mr. John Campbell; plumbing, Mr. John Rowell; heating and hardware, Messrs. Emley and Sons; and electric lighting, Mr. S. Bury, all of Newcastle. The glazing was by the Gateshead Stained Glass Co., and the wood block flooring by Mr. Roger L. Lowe, of Farnworth, near Bolton.

LEGAL INTELLIGENCE.

ROYDON BRICK AND TILE CO., LTD.—A winding-up order having been made against this company on December 8 last, meetings of creditors and contributories were held last week at the Board of Trade Offices, Carey-street, Lincoln's Inn-fields. Mr. Warley, Assistant Official Receiver, presided, and stated that the company was incorporated on May 28, 1896, with a nominal capital of £25,000, and was formed to acquire and carry on a brick and tile manufacturing business at Roydon, Essex, owned by Mr. Thomas Quinn, now deceased. The company acquired the property for £10,250, a lease for fifty years being also granted, the rent being fixed at £200, with a royalty of £500 per annum. No prospectus was issued, and it was stated that one of the objects of the promotion was to raise money on debentures, and altogether £4,000 had been issued. The purchase money was satisfied by the payment of £250 in cash, and £10,000 shares were allotted to Mr. Quinn as fully paid. The failure of the company was ascribed to the want of proper management, which resulted in the manufacture of defective bricks. The heavy cost of cartage also contributed to the failure, the estate (which covered 68 acres) being some distance from a railway station. The unsecured liabilities were estimated at £2,874, and £4,000 was due upon debentures. The assets were estimated to produce £1,107, and, as regards contributories, there was a deficiency of £15,773. The estate was now in the possession of Mr. T. Garman, who was appointed receiver under an administration order of the late Thomas Quinn, but his claim to the property was not acknowledged by the Official Receiver. So far as could be ascertained, there was no prospect of the unsecured creditors receiving anything. The contributories resolved to leave the matter in the hands of the Official Receiver as liquidator, and the meeting of creditors was adjourned *pro formâ*.

IMPORTANT ARBITRATION.—JOHN DICKESON, JUN., v. HEPBURN AND GALE, LIMITED.—In this case, J. Dickeson, jun., builder and contractor, 11, Lintwood-road, Balham, referred to arbitration his claim for £300, balance of a building contract executed for Messrs. Hepburn and Gale, Ltd., leather dressers, of 239, Long-lane, Bermondsey. Mr. Henry Currey, architect, of 37, Norfolk-street, Strand, was the arbitrator. Mr. R. M. Bray, Q.C., appeared for Mr. Dickeson, and Mr. Glen appeared for Messrs. Hepburn and Gale. Mr. Dickeson, jun., entered into a contract to erect an addition to Messrs. Hepburn and Gale's factory within three months from April 11, 1896, failing which he was to incur a penalty of £5 per day for every day beyond that time. The works in question were not completed until Oct. 1, 1896, or 80 days beyond the specified time, for which the employers claimed £400 as liquidated damages; but upon the certificate of their architect, Mr. Joseph Gale, dated Nov. 11, 1897, that the works could not have been reasonably completed before Aug. 22, 1896, they modified their claim accordingly. The contractor repudiated the claim on the grounds that he was delayed by extra works occurring in the excavation of the foundations: also in the supply by other contractors to the employers of the constructional ironwork and iron sashes in connection with the building. Messrs. Hepburn and Gale had entered into contracts with two other firms for the supply of this ironwork, and the contractor's specification provided only that he should build in the ironwork as supplied. It appeared from the correspondence between the various parties in connection with the work, that Messrs. Hepburn and Gale had already obtained payment of fines from these firms for non-delivery within the coutract time. Mr. Bray, for the contractor, also contended that the wording of the contract provided that if the work be delayed by any causes not under the contractor's control, due allowance should be made by the architect, and then the contractor should complete the work within such time as the architect should consider reasonable, and should, from time to time, in writing appoint; but no time had been appointed by the architect during the progress of the work for completion, nor had he appointed any date until he gave his certificate of the 11th of November, 1897, nearly fourteen months after the works were finished, when he certified in writing they could reasonably have been completed by the 22nd of August, 1896—i.e., six weeks after the original contract time. He also said that, as no time had been appointed during the progress of the work, the employers had no claim on the contractor for damages. Mr. Glen, for the employers, said this was a legal point on the construction of the contract which could not be decided by the arbitrator without legal advice, or being taken before a Judge of the High Court; but after some argument, counsel agreed that the arbitrator should have a legal adviser to sit with him, to give his opinion. This course was adopted, and Mr. Currey awarded, on the 22nd Jan., 1898, that the sum of £300, balance of the contract, is to be paid forthwith by the employers to Mr. John Dickeson, jun.; also that the employers should forthwith pay the sum of £37 11s. 6d., being the arbitrator's charges for the reference; and, moreover, the employers were to pay the whole of Mr. John Dickeson, jun.'s, costs of the reference to arbitration upon taxation of same. The above case was heard on Dec. 20, 1897, at Room 521, Law Courts, Strand, and adjourned to Dec. 23, 1897, at Mr. Currey's office. He gave his award on Jan. 22 inst. Messrs. Hopgoods and Dawson, solicitors, 17, Whitehall-place, acted for Mr. J. Dickeson, jun. Messrs. Benson and Co., solicitors, acted for Messrs. Hepburn and Gale.

OLD CHURCHES AND THE BUILDING ACT.—At Southwark Police-court on Wednesday, John Bullers, builder, of Dockhead, was summoned by Mr. Bernard Dicksee, district surveyor, for fees amounting to £7 17s. 6d., in connection with certain alterations at St. Matthew's Church, New Kent-road. Mr. Wallace, barrister, defended. The complainant said he claimed, under the London Building Acts, to have jurisdiction over the alterations, which comprised an extension and raising of the chancel and an encroachment upon the passage in the nave. He admitted that these works did not affect the structure. Mr. Wallace contended that the church, being an old building, the complainant would have no jurisdiction over works which did not affect the building, and which did not increase the accommodation. Some limit must be placed to the powers of district surveyors, and some liberty of the subject must be allowed in such matters. After a lengthy argument, Mr. Fenwick reserved his decision.

A SUCCESSFUL APPEAL.—In the Court of Appeal, London, on Friday, Mr. W. N. Brims, contractor, Newcastle-on-Tyne, was successful in his appeal from Mr. Registrar Brougham setting aside an order to serve a notice in bankruptcy under the Act of 1890 upon Sir C. M. Palmer, Bart., M.P. The appellant had done certain contract work in the construction of docks at Bilbao for the Spanish Government, Sir Charles Palmer and Mr. Martinez Rivas, a Spanish gentleman, being in partnership over the undertaking. Mr. Brims had obtained a judgment for £16,723 against the partners, and as a considerable portion of that sum still remained unpaid, he desired to serve notice of bankruptcy upon Sir Charles Palmer. Lords Justices Smith, Chitty, and Collins concurred in holding that the judgment debtor was entitled to do so, and allowed the appeal with costs.

BLACKPOOL BUILDING LAWS.—In the Chancery Division, on Friday, Mr. Justice Kekewich resumed the hearing of the case of the Attorney-General, at the relation of the Mayor, Aldermen, and Burgesses of Blackpool v. Siddall, by which the plaintiffs seek to restrain the defendant from bringing forward or permitting to remain erected certain buildings without the corporation's written consent in New-road, Blackpool, which was alleged to be a street within the Public Health Act, beyond the front main walls or buildings on the east side of the New-road. Mr. Wolstenholme, borough surveyor, Blackpool, gave evidence in support of the plaintiff's case, and in cross-examination asserted that what defendant proposed to do was illegal, and must be injurious to the inhabitants. New-road was a public highway, and led from Blackpool to Poulton. Mr. Bramber, building inspector to the corporation, and Councillor Heap having corroborated, this closed the plaintiffs' case. Counsel for the defence maintained that New-road was not a street within the meaning of the Act. The defendant's old buildings at Clifton Bank were not in New-road at all, and to enforce the building line as asked in this case would mean the confiscation of a large amount of property. His lordship, in giving judgment, held that New-road was a street within the meaning of the Act, and granted the injunction asked, ordering the defendant to pull down the buildings, the mandatory part of the injunction, however, not to take effect for three months.

The Prestwich board of guardians have adopted plans for adding casual wards to the workhouse at an estimated cost of £12,000.

The new nurses' home which is being erected behind the Leeds infirmary is expected to be completed before the close of the year. The new building will provide accommodation for 52 nurses. In addition to bedrooms, there will be a recreation-room, a sisters' room, a visitors' room, and a study. Mr. W. H. Thorp, of Albion-street, is the architect.

A meeting of employers connected with the building trade was held in the Albert Hall, Morecambe, on Tuesday week, to consider the advisability of forming a masters' association. Addresses on the advantages of federation were given by Mr. Tomlinson, Preston, the secretary of the Lancashire Federation; Mr. Gartside, Chorley; and Messrs. Parker, Ridd, and Sharples, Longridge. After some discussion, it was decided that an association be formed, and that Messrs. J. Scott, J. H. Brear, J. Gardner, J. Escolme, and A. Woodhouse be a committee to draw up the necessary rules. Mr. J. Edmondson was elected chairman, Mr. F. J. Baxter treasurer, and Mr. J. Willis secretary.

STATUES, MEMORIALS, &c.

CAEDMON MEMORIAL.—At a meeting of the Executive Committee held at Whitby on Saturday, Canon Rawnsley presented the design for the cross to be erected in the churchyard of St. Mary's, which had been prepared by Mr. Hodges, F.S.A., of Hexham. The design is based in scale and treatment upon the Ruthwell, Rothbury, Acca, and Bewcastle crosses. On one side appear in four panels, Christ, David, Hilda, and Caedmon; on the obverse the double vine. Within its spandrils are figures of the six bishops trained in Whitby Abbey and Cuthbert and Bede. Below is carved an English rendering of the famous nine lines of Caedmon's Creation poem. The two sides of the cross are filled with a scroll of wild rose and apple, with birds and animals, symbolising the care for all life taught by the spirit of Christ. The design, with the estimate of the stone-carvers, Messrs. Beall, of Newcastle, was provisionally accepted.

WATER SUPPLY AND SANITARY MATTERS.

JOINT SCHEME OF WATER SUPPLY FOR DERBYSHIRE VILLAGES.—A meeting of representatives of the New Mills and Whaley Bridge Urban District Councils, and the Rural District Councils of Disley and Chapel-en-le-Frith, was held at Whaley Bridge on Friday for the purpose of adopting a joint scheme of water supply. Mr. Stirling, of Messrs. Stirling and Swann, engineers, described a scheme. It is proposed to make a large reservoir at Taxal with a storage capacity capable of supplying a population of 7,000 with 25 gallons per head per day, and capable also, with little extra cost, of being made to give double that population the required quantity. About nine acres of land would be required for the reservoir. Without branches the cost of the joint scheme, with mains, &c., would be £22,696 18s. 7d., or with the necessary branches £26,033 5s. Taxal would pay £1,224 0s. 1d., Fernilee £4,858 1s. 9d., Chapel-en-le-Frith £1,745 1s. 10d., Whaley Bridge £6,747 8s., Disley £1,361 6s., and New Mills £10,096 19s. 3d. Colonel Jodrell, M.P., had agreed to let a company or the joint councils have the water free until the scheme became a paying one for the districts served. A lesser scheme excluding New Mills was also submitted. The scheme was discussed at considerable length, and finally the meeting was adjourned.

METROPOLITAN WATER COMMISSION.—Sir Alexander R. Binnie, the chief engineer of the County Council, gave further evidence on Monday before the Royal Commission appointed to inquire into the supply of water to the Metropolis. He expressed his strong preference, in respect to the increased supply that would shortly be required, for the works being carried out by some public body rather than by commercial companies. Such a system would put an end to constant inquiries, such as had been going on since 1811, and would enable the public authority to carry out the suggestions of various commissions and committees. In the next place it would put London in a similar position to that which was at present occupied by most of the important towns of the kingdom. Again, according to all the authorities on the subject, London must have its present supply more than doubled in the next thirty or forty years. The present supply of water might be taken for the year 1896 at 198,000,000 of gallons per day. Its cost in capital expenditure had been £16,531,346, or at the rate of £83,492 per 1,000,000 gallons per day. If water were brought from Wales, it would be pumped into the present high-service reservoirs of the companies, and would thence gravitate to different parts of London. He did not think the expense of making the necessary connections between the works of the existing companies, if they should be purchased by the London County Council, would be very large. The Commission adjourned to Monday next.

The final audit of the account for the restoration of the fabric of Gloucester Cathedral was published on Saturday. The total sum raised, including the Freemasons' gift and a grant from the Ecclesiastical Commissioners, is £9,789.

The Finance Committee of Aberdeen Town Council had under consideration on Monday the question of the office and duties of the city architect. A report showing the amount of remuneration received by Mr. Rust, the present city architect, since he was appointed to the office, was submitted. Councillor Fleming moved that the committee recommend that a new official be appointed, to be called city architect and clerk of works, who will have charge of all the works promoted by the town council, and that he devote the whole of his time to the duties of the office. He suggested that the salary should not exceed £300. The previous question—that the office and duties of the city architect remain as at present—was moved, and this was carried by eight votes to two for Councillor Fleming's motion.

Our Office Table.

Two new pictures have just been added to the collection in the National Gallery at Trafalgar-square. Both are portraits, one being that of Madame Vigée le Brun, painted by herself at the age of 27: it was hung on Friday in Room XVII.; the other has been given by the Rev. Alfred Gurney, and is by Mr. G. F. Watts, R.A. It represents the late Mr. Russell Gurney, Recorder of London, and long the member for Southampton. It will shortly be placed in Room XXI. in the English wing. To the Tate Gallery of British Art at Millbank two pictures have also been added during the past week. A body of subscribers have presented to the National Gallery through their hon. treasurer, Sir James Blyth, a picture by Mr. Frederick Goodall. R.A., entitled "The Ploughman and Shepherdess," exhibited last summer in the Royal Academy. The second is the portrait of Mr. G. F. Watts, R.A., by himself, which was bequeathed under certain conditions to the nation in 1892 by the late Sir William Bowman. The picture, which until recently has been on exhibition at Stockholm, has now been handed over by Mr. J. Fred Bowman to the trustees.

At Tuesday's meeting of the London County Council a special return was issued by the Finance Committee on the Works Department, being a statement of the whole of the estimated works commenced, completed, and certified, and of jobbing works certified since the change in management in December, 1896. It showed revised estimates amounting to £14,347, actual cost £10,681, amount of saving £3,665, or 25½ per cent. On jobbing works the schedule value was £25,308, and actual cost £23,150, a saving of £2,158, or 8½ per cent. The total saving was 14½ per cent. With regard to the Boundary-street works, where the difference of cost below the estimate was £2,995, the chief causes which enabled so large a saving to be effected were that, in consequence of other works being carried on within the same area, they were able to employ the same foreman, timekeeper, watchman, &c., on these as on other works, and by that means to save largely in wages each week, and they had the further advantages of retaining the services of men who had become accustomed to their requirements. The same advantages operated in the provision of water supply, lighting, and watching. The other works which this department was carrying out formed a partial protection, and they already had a quantity of hoarding on the ground, so that very little expense was incurred in this respect. On the other hand, had a contractor been employed for this work, the Council would not have benefited by these advantages. The department purchased some of the principal materials required at a much lower price than the current market rates. The Council would effect considerable economy if works were carried on continuously, keeping the staff, plant, and men uninterruptedly employed. After some discussion, the report was accepted without a division.

Some progress is being made by the officials of the London County Council towards the preparation of a ground plan of London. The Corporate Property Committee stated on Tuesday that at the present moment no fewer than 2,276 estates, representing two-thirds of the area of the county, had been scheduled, and that a further 116 were waiting to be defined. This work had been accomplished for £1,972. On the last occasion when they reported, but three-fifths, or 1,804 estates had been defined. The average cost of doing the work had been 9½d. per acre.

A dinner was given by the Central Association of Master Builders of London in the Blue Salon of the Trocadero Restaurant, Piccadilly-circus, on Tuesday evening, to entertain the President and Council of the National Association of Master Builders of Great Britain. Mr. William Shepherd, the president of the Central Association, occupied the chair, and was supported by Professor George Aitchison, R.A., P.R.I.B.A., Mr. J. Stevenson Jones, the president of the National Association, Messrs. Hampton W. Pratt, P.A.A., T. Blashill, F.R.I.B.A., Frank May, J.P., J. Bowen, J.P. (Birmingham), W. Holdsworth, J.P., W. Jessop, H. H. Bartlett, A. Krauss (Bristol), G. H. Barnsley, T. F. Rider, J. Howard Colls, F. J. Dove, J. C. White, Howell J. Williams, H. Seth-Smith, Henry Holloway, Stanley G. Bird, Charles Wall, Joseph Randall, L. J. Maton, E. Hind, J. A. S. Hassal, R. S. Henshaw (secretary Central Association), &c. A selection of music was performed under the direction of Mr. Herbert Schartau. The principal toasts were: "The Royal Institute of British Architects," proposed by Mr. F. J. Dove, and acknowledged by Professor Aitchison, the president; "The Architectural Association," proposed by Mr. J. H. Colls, and responded to by Mr. Pratt, the president; and "The National Association of Master Builders," proposed by the Chairman, and also acknowledged by the President, Mr. Stevenson Jones, and by Mr. Rider, past-president. Mr. Charles Wall, of Chelsea, then gave the toast of "The Provincial Associations," Aldermen Holdsworth and Bowen replying. The health of "The Chairman" was proposed by Mr. J. C. White, and that of "The Visitors," proposed by Mr. Holloway and acknowledged by Mr. Blashill, the architect to the London County Council, brought the proceedings to a close.

According to the *City Press*, owners of burnt-out property in the area affected by the Cripplegate fire find that the provisions of the new Building Act will materially affect their net returns. On comparatively small warehouses they are called upon to incur a large additional expenditure, amounting in many cases to 25 per cent. extra upon the original cost, for which, owing to the fact that the obligations under the leases are running, they will receive no return for a dozen years or more. Another grievance is that the district surveyor orders them to do one thing, and the officer who represents the London County Council acts in quite a contrary manner, and insists on an entirely different course being taken. How to please both is a problem they have hitherto failed to solve.

The mixtures, greases, and oils usually employed as a lubricant for plaster moulds have the disadvantage of being sticky or of easily attracting dust. According to Puscher, this drawback is avoided if stearic acid is used instead. Melt one part stearic acid in a glass by immersing the same in boiling water and add four to five parts alcohol (95 per cent.). Agitate the clear solution until cold, whereby a thin paste of very finely distributed stearic acid is formed, with which the moulds are coated by means of a painting brush. The spirit evaporates at once and leaves a thin layer of stearic acid, which admits of readily freeing the cast from the mould.

The London and North-Western Railway Company have decided to proceed immediately with the construction of the new station at Lancaster, the cost of which will be from £60,000 to £70,000. Negotiations for the land have been concluded, the corporation having arranged a transfer which will enable them to proceed with an important street improvement. The new station will be upon and slightly north of the present Castle Station.

The proposed Builders' Exchange for Halifax has now been successfully launched, the officers for the ensuing year having been appointed as follows:—President, Mr. Edwin Naylor; vice-presidents, Messrs. Schedeur Hartley, Isaac Firth, and William Oates; treasurer, Mr. W. Jelley; secretary, Mr. Alfred E. Dalzell.

The public library, Neath, is being warmed and ventilated by means of Shorland's patent Manchester grates, Shorland's patent exhaust roof ventilators, and special vertical inlet tubes, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The hoarding which now hides City-square, Leeds, from public view is expected to be removed in about six weeks. The granite balustrade, which forms a circle 100ft. in diameter around the space where the equestrian statue of Edward the Black Prince is to stand, is almost completed. The concreting of the circle is finished, but the flagging outside the balustrade remains to be done. Around the balustrade eight small figures, representing alternately Night and Morning, are to be placed. Each figure will hold a 500-candle-power electric lamp. These figures are expected to be ready before the close of the present year. The plans for laying out the square were prepared by Mr. Bakewell, architect, of Leeds.

At the Railway Hotel, Weston-super-Mare, on Friday, the annual dinner in connection with the Master Builders' Association was held, the chair being occupied by the president, Mr. W. Dyer. The principal toast was "The President, Officers, and Association," proposed by Mr. W. H. Wooler, and acknowledged by the chairman, Mr. C. Addicott (vice-president), and Mr. W. H. Shorney (secretary).

MEETINGS FOR THE ENSUING WEEK.

Saturday (To-morrow).—St. Paul's Ecclesiological Society. Annual Meeting at St. Paul's Chapter House. 2.30 p.m.

Monday.—Society of Arts. "Decorative Bookbinding." Cantor Lecture No. 2, by Cyril Davenport. 8 p.m.

Tuesday.—Institution of Civil Engineers. "Reservoirs with High Earthen Dams in Western India," by W. L. Strange. 8 p.m.

Wednesday.—Society of Arts. "The Cinematograph," by Jules Fuerst. 8 p.m.

Friday.—Architectural Association. "Hampton Court Palace," by John Belcher, F.R.I.B.A. 7.30 p.m.
Birmingham Architectural Association. "House Decoration," by L. A. Shuffrey. 6.45 p.m.

THE ARCHITECTURAL ASSOCIATION.
FEBRUARY 4th, ORDINARY GENERAL MEETING, 7.30 p.m. Mr. JOHN BELCHER on "HAMPTON COURT PALACE." (Lantern Views)
FEBRUARY 5th, FIRST SPRING VISIT. Members to meet at Lord Rubbledale's house, corner of Norfolk-street and Green-street, Park-Lane, W., 2.30 p.m.
E. ROWLEY SIM, } Hon. Secs.
G. B. CARVILL, }

Trade News.

WAGES MOVEMENTS.

Ashford, Kent.—A movement is being made on the part of the men engaged in the local building trade to secure an increase of one penny per hour in their wages. The masters have been interviewed by the representatives of the men, and the result is that they have offered an increase of a half-penny per hour all round. It is not considered likely that the offer will be accepted, as the men still hold out for the penny advance.

Tavistock.—As the result of a meeting at Tavistock on Saturday between representatives of the Amalgamated Society of Carpenters and Joiners from Plymouth and the master builders and carpenters in Tavistock, it was agreed that the men should work 53½ hours instead of 56 in the summer, and 51 in winter, and that the minimum rate of wages should be 6d. per hour, instead of 5d. This puts an end to anything that remained in the form of a strike, which originated on April 1 last.

CHIPS.

At Friday's meeting of the town council of Stockport it was decided, after a long discussion, to erect a new and more adequate town hall, and the questions of a site and the probable cost were referred to a committee. It was also decided to erect a new fire-station on a portion of the Mersey Mill site, Heaton-lane, from plans and drawings prepared by Mr. John Atkinson, borough surveyor.

Mr. H. H. Law, Local Government Board inspector, sat in the Council Chamber, Birmingham, on Friday, to inquire into applications by the city council for sanction to borrow £10,000 for lunatic asylum purposes, and £12,510 for the erection of a refuse destructor at the Montgomery-street Wharf. Referring to the application for sanction to borrow £10,000 for lunatic asylum purposes, the town clerk said that the money was required for the purchase of 99 acres of land, which was destined to be the site of the new lunatic asylum.

A meeting of the harbour committee of the Weymouth Town Council was held on Friday, when the scheme for the erection by the Great Western Railway of new harbour and railway works at a cost of £200,000 was considered. Unsatisfactory features in connection with the new scheme were pointed out. The loss to the town by the diversion of the present harbour dues will be very heavy, and a strong effort will be made to secure compensating advantages. The company's Bill in Parliament will probably be opposed.

The Queen, it is stated, meditates making some improvements at Osborne. Her Majesty's architect has been in consultation with her, and has placed certain plans before the Queen in harmony with her suggestions. As a result the work will, in all probability, be proceeded with as soon as her Majesty has vacated the mansion for her next visit to Scotland.

The Local Government Board have issued an order sanctioning the application of the Portland District Council for power to borrow the sum of £35,000 for completing a scheme for supplying the island with water from Upwey.

It has transpired that at the election of Royal Academicians on Wednesday in last week there was a tie for the filling of the second vacancy, Professor Aitchison and Mr. Seymour Lucas gaining the same number of votes each—27. In accordance with traditional usage the president awarded his casting vote to the senior associate, thus electing Mr. Aitchison.

LIST OF COMPETITIONS OPEN.

Carlton, Victoria—Children's Hospital	£100, £50, £25	J. Nicholson, Hon. Sec., Pelham-street, Carlton, Australia	Jan. 30
Leicester—Motor Refuse Carts	Corporation	E. G. Mawbey, Borough Engineer, Leicester	,, 31
Rugby—Public Work, Cattle Market		T. M. Wratislaw, Clerk, Rugby	Feb. 1
Eastleigh—Public Offices	5gs. (merged), 20gs.	Hy. White, Clerk, U.D.C., 19, St. Peter's-street, Winchester	,, 7
Wolverhampton—Motor Vans	Public Works Committee	J. W. Bradley, C.E., Borough Engineer, Town Hall, Wolverhampton	,, 7
Barrow-in-Furness—Technical Schools	£50 (merged), £20	The Town Clerk, Town Hall, Barrow-in-Furness	,, 14
Port Elizabeth—Free Library (Assessors, Sir F. Blaine and R. H. Hammersley-Human—£22,000 limit)	100 Guineas, 50 Guineas	G. Oettle, Librarian, Port Elizabeth, S.A.	,, 15
Winchester—Public Baths	£25, £15	Walter Bailey, Town Clerk, Guildhall, Winchester	,, 28
New York—Sun Dial—Plaster Model	500dol., 250dol.	Sec. National Sculpture Soc., 215, West 57th-street, New York	,, 28
Newcastle-on-Tyne—New Infirmary (local Architects)	(No first) £150, £100, £50	Secretary Building Committee, Newcastle	Mar. 1
Berwick-on-Tweed—Police-Station (£5,000 limit)	Commission or £50, £25	R. Weddell, Town Clerk, Berwick-on-Tweed	,, 14
Belper—Sewage Disposal Schemes	50 Guineas, 25 Guineas	Joseph Pym, Clerk, Belper	May 1
Stockholm—City Railway Stations and Junctions	£656, £438, £219	Consulate General, 27, Great Winchester-street, E.C.	Aug. 31
West Bangour, Linlithgowshire—Lunatic Asylum (limited to Scotch Architects)	£250, £200, £150, £100	Secretary, District Lunacy Board	—
Southampton—Fireproof Flooring, Warming, &c., Municipal Lodging Houses		W. B. G. Bennett, Borough Surveyor, Southampton	—
Royal Aquarium—Design for Poster	10 Guineas	Edgar S. Shrubsole, Royal Aquarium, London	—

LIST OF TENDERS OPEN.

BUILDINGS.

Great Burstead—Repairs to White Bridge	Billericay Rural District Council	C. Edgar Lewis, Clerk, Brentwood	Jan. 29
Long Ridge—Five Houses, Pitt-street	Co-operative Society	William Munford, 33, Guildhall-street, Preston	,, 29
Killeter—Creamery		Charles Clarke, J.P., Aughevarron, Castlederg	,, 29
Burnley—Alteration of Premises at Central Club	G.U.O.F. Building Committee	Jas. Kippax, Secretary, Central Club, Burnley	,, 29
Morley—Bakery and Stables, Fountain-street	Metcalfe and Bradshaw	Buttery and Birds, Architects, Morley	,, 29
Pudsey—Sunday School		Hodgson and Farrar, Architects, Old Bank Chambers, Bradford	,, 29
Kidderminster—Rebuilding Out-Offices, Hume-street Schools	School Board	W. M. Roden, Clerk, Kidderminster	,, 29
Hull—Play-Shed and Gymnasium at Grammar School	Corporation	A. E. White, City Engineer, Town Hall, Hull	,, 29
Branderburgh, N.B.—Cottage		R. B. Pratt, Architect, County Bank House, Elgin	,, 29
Cork—Nine Houses, College-road	John Kelleher	W. H. Hill and Son, Architects, 28, South Mall, Cork	,, 29
Bath—Terrace, Newmarket-row	Markets Committee	C. E. Davis, F.S.A., City Architect, Bath	,, 29
North Berwick—Additions, Free Church Manse		Geo. Nelson, Clerk, Quadrant, North Berwick	,, 29
Paisley—Masons' Work (till May 15, 1899)	Commissioners	M. Moncur, Master of Works, Municipal Buildings, Paisley	,, 29
Pontefract—Shop Front, Beast Fair	Mrs. Brook	Tennant and Bagley, Architects and Surveyors, Pontefract	,, 29
Wolverhampton—Shelter, East Park	Corporation	J. W. Bradley, Board Engineer, Wolverhampton	,, 29
Kirkcaldy—Six Shops and Fifteen Dwelling-Houses, Whytehouse Mansions	Whytehouse Estates Co.	Robert Little, Architect, 4, St. Brycedale-avenue, Kirkcaldy	,, 31
Hull—Rebuilding Swan Inn, Beverley-row	Moss and Robson	Freeman, Son, and Gaskell, Architects, Carr-lane, Hull	,, 31
Annfield Plain—Mineral Water Factory		D. M. Spence, Architect, Front-street, Annfield Plain	,, 31
Port Glasgow—Story on Jean-street School	School Board	John Hood, Clerk, Port Glasgow	,, 31
Shoreditch—Transformer Sub-Station, Worship-street	Shoreditch Vestry	H. Mansfield Robinson, Vestry Clerk, Town Hall, Old-street, E.C.	,, 31
Londonderry—Three Houses, Northland-road		Wm. Barker, Architect, 3, Richmond-street, Londonderry	,, 31
Clown—Additions to Schools	School Board	Rollinson and Son, Architects, 3, Corporation-street, Chesterfield	,, 31
Tooting Common—Refreshment House	London County Council	T. Bell, Clerk, Council Offices, Spring-gardens, S.W.	,, 31
Hull—Rebuilding Duke of Cumberland Inn	Moss and Robson	Freeman, Son, and Gaskell, Architects, Carr-lane, Hull	,, 31
Cork—Pair of Semi-Detached Villas		W. H. Hill and Son, Architects, 28, South Mall, Cork	,, 31
Tregaron—Intermediate School	County School Managers	M. Morgan, Clerk, Tregaron	,, 31
East Ham—Schools (for 1,645 Children), White Horse-lane	School Board	W. J. Brett, Clerk, Lichfield-terrace, Upton Park, E.	,, 31
Camberwell—Refreshment House, Myatt's Fields	London County Council	T. Bell, Clerk, Council Offices, Spring-gardens, S.W.	,, 31
Sutton-on-Hull—Bungalow and Villa		Freeman, Son, and Gaskell, Architects, Carr-lane, Hull	,, 31
Ford—Reseating Board-Room	Guardians of Stoke Damerel	Albert Gard, Clerk, 19, St. Aubyn-street, Devonport	,, 31
Glasgow—Steward's House, Lodges, Entrance Gateway, Water Tower, Storage Tanks, & Boundary Walls, Ruchill Hospital	Corporation	John Lindsay, Interim Clerk, City Chambers, Glasgow	Feb. 1
Manchester—Twenty-Six Cottages at Miles Platting	Improvement Committee	City Surveyor, Town Hall, Manchester	,, 1
Southampton—Isolation Hospital, Monsehole-lane, Millbrook	Corporation	George B. Nalder, Town Clerk, Municipal Offices, Southampton	,, 1
Bourne—Cattle Market	Warwick and Richardson	F. G. Shilcock, Architect, West-street, Bourne, Lincs	,, 1
Paignton—New Buildings	Gas Company	F. W. Puddicombe, Secretary, 5, Victoria-street, Paignton	,, 1
Market Bosworth—Iron Hospital	Rural District Council	W. M. Sykes, Surveyor, Market Bosworth	,, 1
Llantrisant—Calvinistic Methodist Chapel and Vestry		The Crown Shop, Llantrisant	,, 1
Tullyallen—New Church	Rev. Thomas Taaffe, P.P.	William H. Byrne, M.R.I.A., Architect, 20, Suffolk-street, Dublin	,, 1
Manchester—Thirty-Four Cottages at Miles Platting	Improvement Committee	City Surveyor, Town Hall, Manchester	,, 1
King's Lynn—Purifying House	Gas Co.	E. G. Smith, Engineer, Gasworks, King's Lynn	,, 1
Isle of Grain—Thirteen Dwelling-Houses	Coastguard	Director of Works Departmt., Admiralty, Northumberland-avenue	,, 1
Manchester—Offices, Whitworth-street	Improvement Committee	The City Surveyor's Office, Manchester	,, 1
Dudley—Grammar School and Master's House, St. James's-rd.	Governors of Grammar School	Albert Morton, Clerk to the Governors, 15, Birmingham-rd., Dudley	,, 1
Liverpool—Padded-Room and Lavatories, Smithdown-road Workhouse	Guardians of Toxteth Park	J. Moulding, Clerk, 15, High Park-street, Liverpool	,, 2
New Cross, S.E.—Alterations to North Lodge Stores	Metropolitan Asylums Board	T. Ducombe Mann, Clerk, Norfolk House, Norfolk-street, Strand	,, 2
Bourne—Cattle Market		J. Clare, Architect, Sleaford	,, 2
Dorking—Pumping-Station Buildings	Dorking Waterworks Co.	The Secretary, Dorking Waterworks Co., 72, High-st., Dorking	,, 2
Sheffield—School at Daniel Hill	School Board	Hemsoll and Paterson, Architects, 18, Norfolk-row, Sheffield	,, 2
Bourne—Blacksmith's Shop	Bourne Brewery Co.	J. Clare, Architect, Sleaford	,, 2
Ascot—Additions, Station Hotel		S. C. Johns, M.S.A., Wallingford	,, 3
Bristol—Alterations to Premises, Wine-street	L. Packham	Henry Williams, Architect, 24, Clare-street, Bristol	,, 3
Skegness—Laundry Buildings		Thimbleby and Sons, Secretaries, Spilsby	,, 3
Sandbach—Brick Tank at Pumping Station	Urban District Council	W. Wyatt, Engineer, Bryndwr, Shrewsbury	,, 3
Boston, Lincs—Wesleyan Sunday Schools		Gelder and Kitchen, Architects, 76, Lowgate, Hull	,, 3
Mitchelstown—Medical Officer's Residence, near Galbally	Mitchelstown Guardians	Richard Fitzgibbon, Clerk, Mitchelstown	,, 3
Halifax—Pair of Semi-Detached Villas, Savile Park		Medley Hall, Architect and Surveyor, 29, Northgate, Halifax	,, 4
Penrhyneudraeth—Vagrant Wards at Workhouse	Festiniog Board of Guardians	Thomas Roberts, Clerk, Portmadoc	,, 4
Keighley—Two Houses, Fell-lane		Barber Hopkinson and Co., Archts, Craven Bank Chmbrs, Keighley	,, 4
Dewsbury—Two Shops in Northgate		Holtom and Fox, Architects, Westgate, Dewsbury	,, 4
Port Talbot—Schools for 800 Children	Margam School Board	Frank H. Smith, Architect, Port Talbot	,, 5
Cross Houses—Wards and Porter's Lodge at Workhouse	Guardians of Atcham Union	J. R. Withers, Architect, St. Mary's-court, Shrewsbury	,, 5
Raphoe—Teachers' Residence		P. Gillespie, Schoolmaster, Raphoe	,, 5
Earlestown—Premises, Crow-lane	Industrial Co-operative Society	P. M. Beesley, Architect, 2, Bridge-street, Earlestown	,, 5
Broadley—Vicarage		T. H. Farrar, Architect, Fountain Chambers, Halifax	,, 5
Crawcrook—Shop, House, and Cottage	Thos. Pattinson	Michael Westgarth, 1, Barmoor-terrace, Ryton-on-Tyne	,, 5
Marykirk—Napier School		Burness and Dickson, Solicitors, Montrose	,, 5
Exmouth—Additions to 15, The Parade	James Pulsford	R. M. Challice, Architect, 9, Bedford-circus, Exeter	,, 7
Sandbach—Alterations to House and Shop in Bond-street	Industrial Co-operative Society	Alfred Price, Architect, Sandbach	,, 7
Lochlee—Servants' Room at Invermark Lodge		Jenkins and Marr, Architects, 16, Bridge-street, Aberdeen	,, 7
Cwmbran—Police Station	Standing Joint Committee	William Tanner, F.S.I., County Surveyor, Monmouth	,, 7
South Acton—House and Laundries, Park-road North	Henry Hawkes	Edward Monson, F.R.I.B.A., 22, Buckingham-st., Adelphi, W.C.	,, 7
Keith—Shop and House, Mid-street		John Alcock, Architect, Keith	,, 7
Hipperholme—Offices, House, Store-Sheds, &c.	Urban District Council	J. E. and E. H. Hill, Solicitors, 4, Harrison-road, Halifax	,, 7
London—Enlargement of Fire-Engine Stations in Heath-street, Hampstead, and Simpson-street, Battersea	London County Council	C. J. Stewart, Clerk, Spring-gardens, S.W.	,, 8
Hove—Three Dwelling Houses	Coastguard	Director of Works Departmt., Admiralty, Northumberland-avenue	,, 8
Wimbledon—Electric-Lighting Station and Chimney Shaft	Urban District Council	W. H. Whitfield, Clerk, Broadway, Wimbledon	,, 9
Saltaire—Four Houses		James Young and Co., Architects, 62, Market-street, Bradford	,, 9
Sunderland—Infirmary Buildings at Workhouse, Hylton-road	Guardians of Sunderland Union	J. W. Hodgson, Clerk to Trustees, 17, John-street, Sunderland	,, 9
Killbegs—St. Columba's Industrial School		William H. Byrne, Architect, 20, Suffolk-street, Dublin	,, 10
Highgate Hill, N.—Infirmary (for 800 patients), &c.	St. Mary Islington Guardians	Edwin Davey, Clerk, St. John's-road, Upper Holloway, N.	,, 10
Dungeness—Eleven Houses, &c.	Coastguard	Director of Works Departmt., Admiralty, Northumberland-avenue	,, 11
Findhorn—Villa		John Forrest, Architect, 120, High-street, Forres	,, 12
Llangathen—Stone Bridge, Dryslwyn Ford	Carmarthen County Council	Thomas Jones, Clerk, County Council Offices, Llandovery	,, 14
Rowley Regis—Alterations at Tividale Board School	School Board	J. T. Meredith, Kidderminster	,, 14
Lower Edmonton—Eldon-road Schools	Edmonton School Board	John Moule, Clerk, School Board Offices, Upper Edmonton	,, 15
Cowling—Warehouse to Croft Mills	John Binns and Sons, Ltd.	James Hartley, Architect, Exchange Buildings, Skipton	,, 15

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2248.
FRIDAY, FEBRUARY 4, 1898.

NEW SITES AND BUILDINGS.

IN a short time many of the old landmarks in the Metropolis will have disappeared, or will assume such new faces as hardly to be recognisable. The formation of a new street, the reclamation of a waste site, or one cleared by fire, are processes that have gradually robbed us of many historic sites and buildings, which in some cases might have been saved or snatched from the building speculator. A slight detour in the line of a new route might often save an historic building. An old square or courtyard like Staple Inn is worth preserving for the picturesque character or quaintness of its own which cannot be substituted by anything new, any more than an old oak can be replaced by a sapling. By some fatality or spirit of mischievous interference, the line taken for a new route is made to intersect an old property because something is to be made out of the ground that will largely help to float the scheme, or to remunerate the promoters. It is a little Klondyke to them. The same sort of enthusiasm which is prompting the Canadian Government to open up a route through the Dominion to the Yukon Goldfields, is the motive power in making new routes to centres where an open space like a little gold mine is to be found. This is the fever that is just now raging amongst property holders and company promoters in London. Wherever there is an historic site or old inn which has long been a source of pleasure to the lover of "picturesque London," there the vultures for easy gain are found to gather. No reserved site or historical point of vantage is safe from the greed of these speculators. Happily for the inhabitants of London, and those who value old sites and buildings, we have philanthropic bodies and individuals who, by agitating against these schemes for plunder, have helped to secure the much-prized public spaces or gardens for future generations, or have laid them out for recreation. How many sites and buildings would have disappeared during the last decade or so if the City Commissioners and London County Council had not secured them, it would have been sad to relate. These remarks are not without significance when so many schemes for rebuilding are contemplated. The General Purposes Committee of the London County Council are instructed, we believe, to keep a register of buildings of historic or architectural interest. A committee for the Registration of Old Memorials, including members of societies interested in the subject, have been engaged for some time in registering and collecting drawings of old buildings. Whether the results have been printed or not, with plans and drawings of old and interesting buildings, we cannot say; but these are absolutely necessary, and the Council ought not to lose the opportunity that at present exists. The Council ought to have power to purchase or contribute towards the cost of preserving any important site or historic building. The object they should have in view is the maintenance, at least, of any architectural or historical character that attaches to a locality, and in rebuilding old premises and neighbourhoods some regard ought to be given to the aspect and associations, if possible. Probably, in a few instances, it may be an advantage to change the old environment; but this ought to be done with some care, and without shocking the feelings and sympathies of old inhabitants. How many have cause to complain of the orders for demolition and rebuilding in the Metropolis. Old tenants, who have expended large amounts in alterations and improvements to their premises, have been refused a renewal of their lease; in other cases, buildings of an offensive kind, huge dwellings in flats, have been erected close to dwellings, and suburbs once residential have been turned into places of business. We may mention many suburbs in the West-end and South which have been thus degraded. Let us take a few instances.

The London County Council lately agreed to an expenditure of over £200,000 for widening Long-lane and Tabard-street, Southwark, and the continuation of the latter through St. George's Churchyard into Borough High-street. Here we have a locality associated with Marshalsea Prison and "Little Dorrit." The site has undergone many changes, though not long ago a pedestrian might have seen a block of houses back to back, part of the male debtors' side, and the chapel of the later Marshalsea gaol. It is hardly pleasing to think of this ancient part of Southwark so completely changed as not to be recognisable, and the style of the buildings painfully modernised. Another large sum is to be expended, we believe, in widening Southampton-row, whenever that scheme comes off.

What will be done with the large area, now a mere waste of demolished houses, extending from Drury-lane to Catherine-street? Why should hundreds of working men and women have been turned adrift months before new buildings are erected? At present this wasted area is rather a danger to the neighbourhood, where all kinds of refuse can be thrown. Not long ago the Parks Committee of the County Council reported upon the part of this site a churchyard described by Dickens in "Bleak House." This ground is on the north side of Russell-court, and south of Drury-lane Theatre or Vinegar-yard, and was laid out as a playground by the Public Gardens Association, and kept up till lately by the London County Council. The owner of the fee is the Rector of St. Mary-le-Strand, and the County Council has no option in the matter. The Duke of Bedford, we believe, has acquired the land for the purpose of making a road from Drury-lane. The loss of the old playground will be felt. Why the delay in turning the area to useful account—say as a ground for recreation, or, at least, some portion of it? We should be sorry to see it all built over. Between Long-acre and Bow-street Police-court important new buildings have been erected for offices and business premises, much improving a very crowded and unsavoury neighbourhood. The buildings are broadly and picturesquely treated in red brick and stone. A gabled end faces Bow-street, and an arcaded basement in stone for shops is built. The main frontage extends eastwards and ends in Drury-lane, facing the police-court buildings. This elevation is broken by a corner octagon with flat cupola and by lofty gables and roofs with dormers. The brickwork is quite plain, with gauged brick arches over windows, and dressings; bold projecting door-heads, with inserted shell tympana resting on stone corbels, are over the doorways; the windows are plain sashes, divided into panes, and a strict Georgian character is given to the buildings—quite a pleasant relief to the many other instances in which the old character has been replaced by modernised ornamental buildings of a purely commercial kind. Other opportunities present themselves of preserving a little quaintness and picturesque character to new building on sites of historic interest, if only the architect can be found for the emergency.

Then we have the Parliament-street improvement, already commenced by the pulling-down of old houses on the north side. Here a splendid site for new buildings will be presented—or one suitable for London's Municipal offices. The question as to style seems one that ought to have consideration. On the same line of thoroughfare we have a range of palatial buildings like the Home and Foreign Offices, Treasury, Admiralty, &c.—all in some phase of Italian Renaissance. These ought to give the key-note if we wished to preserve any homogeneity. We know what the municipal authorities of Paris or any other Continental city would do in the circumstances. Having the opportunity of continuing the same width, they would bring into unison the whole frontage, the extreme ends or junctions being accentuated by features. But this is not the way our London County Council or their predecessors work. They do not acquire a whole block of old premises, but leave them to drop in one by one; instead of a general plan, elevation, or scheme of frontage being laid down beforehand, every purchaser or lessee can build as he likes, so long as he does not transgress the Building Act. We do not get a perfect scheme, but a patchwork reconstruction—here a little, and there a little, but without any unity.

A very important scheme for the rebuilding of a squalid and densely-built area in Westminster has been proposed by a private company. The site lies to the south of the Houses of Parliament. The boundaries are Great College-street and Little Smith-street on the north, Horseferry-road on the south, and Marsham-street and the Thames on the west and east. The company propose to remodel the whole area—the old warehouses and wharves next the river will be swept away and a portion of the foreshore taken in for the continuation of the Victoria Embankment from Victoria Tower Gardens to Lambeth Bridge. A broad avenue 90ft. wide from Abingdon-street will run in a direction parallel to the Embankment, and replace Millbank-street in a continuation with Grosvenor-road, and another cross street at right angles will be made from Great Peter-street to the avenue. Smith-square, with its curious church of St. John's, will be made a feature in this scheme. Here we have a grand opportunity for a river *boulevard*. The County Council workmen's dwellings scheme on the site of Millbank Prison is important. The remodelled area ought to be worthy of the traditions of the neighbourhood, with Lambeth Palace on the opposite side of the river. A great deal will depend on the design and construction of the blocks which are laid down in the scheme—an element often sadly overlooked.

Other sites will shortly be transformed. Leicester-square is undergoing the process on the north side, and the approach from Charing Cross-road has been widened and rebuilt. Much remains to make this centre worthy of its position. Cripplegate, the area demolished by the late fire, may, perhaps, be reconstructed with wide east and west thoroughfares, connecting London-wall with Smithfield. Jewin-street may be widened to 60ft., and other streets remodelled. The Elephant and Castle site is being demolished, to be rebuilt as we have lately shown. The widening of Tottenham Court-road at the Oxford-street end is proposed under the Improvements Act. A block of houses on the east side of Bozier-court is to be swept away to widen this part of the road, and prevent the block of traffic. The widening of the Strand by the removal of the island of houses between St. Mary-le-Strand and St. Clement Danes is also authorised. Other improvements are contemplated, such as the widening of Southampton-row between High Holborn and Theobald's-road, to a width of 80ft—a very important route. These widening schemes are absolutely necessary, from the growth of traffic.

There appears to be a mania for demolition among many of the City wards, under the

doubtful name of "improvements." When a fire devastates a large area of buildings, as it did in Cripplegate, there is a good excuse for rebuilding and improving by widening the streets; but it is not so when a City authority, like the Bridge House Estates Committee, propose a wholesale demolition of houses in Finsbury Circus and London Wall, merely for the purpose of increasing the income of the estate, disregarding the interests of old tenants, and the outlay they have made on their premises. Large sums of money are spent by tenants who reasonably look for a renewal of their leases; but the ground owners often take no notice of those improvements, and rebuild simply with the object of securing larger rents.

Not only are new sites being opened up, but many of the older streets are beginning to wear quite a new aspect. The old haunts are disappearing, making place for loftier and larger buildings. These are not always improvements. Pretentious-looking buildings are elbowing out quiet and unostentatious structures, which had the merit at least of being comfortable within and substantial. In the old squares and streets of Bloomsbury and Mayfair the dull Classic exterior is gradually being superseded, and in some cases remasked, by more pleasing brick façades. At Harrington Gardens and Bayswater, several new brick houses have been erected from the designs, amongst others, of Messrs. Ernest George and Peto, Mr. Norman Shaw, and Mr. F. B. Wade, and at Queen's Gate and Sloane-street we find a few exceedingly well-treated red-brick designs, in which the architects have produced an effective brick style from simple Classic features. Could we insure this class of architecture in our business thoroughfares instead of the obtrusive and bizarre of the modern commercial builder, we should have less cause to grumble at so called street improvement.

AMENDMENTS TO THE LONDON BUILDING ACT.

NUMEROUS decisions have been given by the High Court upon the London Building Act which have seriously hindered the administration of the law, and have encouraged the proceedings of those who wish to evade the spirit of the Act. District surveyors have found it very difficult and hazardous to administer certain provisions, especially those relating to dangerous structures. We lately referred to one case of this kind, in which the appeal against the magistrate's decision was dismissed, and in which the High Court declared the summons taken by the Council was wrong, and that they had not made reasonable inquiry to discover the owner. These adverse decisions have made it urgent for the L.C.C. to propose amendments to the Act, and the committee intrusted with this business have lately reported upon the subject. They refer to certain decisions which have rendered the working of the Act very difficult. One of these decisions we have noticed in a recent article *re* Mead, a Metropolitan magistrate, when he appeared to show cause against a rule for a *mandamus* why he should not hear and determine a summons under the Act with regard to a dangerous structure, the question being whether a summons under section 107 could be properly served by being affixed to the premises only. The summons was addressed to the "owner" of the premises merely, who did not appear. The authorities then proposed to proceed in his absence, on proof that the summons had been affixed to premises. The owner was unknown, but it appears no steps were taken to discover him, and the Council thought that service under section 188 (1) was sufficient. The magistrate thought the service of summons addressed to the "owner" was a notice the service of which is provided for by the Summary Jurisdiction Act, and must be served personally—even if not, he said reasonable diligence had to be exercised in discovering the owner, and therefore he held there had been no valid service of the summons. Mr. Justice Wright thought if, after reasonable inquiry, the owner could not be found, the procedure under section 188 was applicable; but in this case they had not made sufficient inquiry, therefore the application against the magistrate failed. The Council had first to prove inquiry, then the failure to find the owner, and that the premises were empty. As the report of the committee says, this decision materially affects the proceedings against the owner of a dangerous structure. For section 188 is clear: it states that "If no person be found on the premises, then by fixing a copy thereof (notice) on some conspicuous part of the building to which it relates." Sub-section (3) provides that a "Notice to the owner or occupier of any premises may be addressed by the description of the "owner" or "occupier" of the premises (naming them) without further name or description." No wonder the Council refer to this decision, which is practically this: that if the Council made reasonable inquiry, and could not discover the owner, a summons could be served under section 188; but if they could show no evidence of such inquiry, their summons was invalid. How, it may be asked, can "reasonable inquiry" be proved? Is it necessary to establish documentary proof as to the ownership? The committee think that for the purpose of these proceedings as to who is owner, a search in each case for documentary proof is necessary to be made before a summons can be taken out. Imagine the trouble involved in such a search.

In the case of a dangerous structure, it should be dealt with promptly, which cannot be done if these inquiries have to be made. Under the old Act no such difficulty arose, as in all cases of dangerous structures, all documents in proceedings could be served on some person on the premises, or otherwise by affixing them thereto. The importance of expeditious action in these cases has been proved over and over again; and the committee mention a case where, owing to a magistrate refusing to adjudicate in consequence of some informality in the service of the summons, two men narrowly escaped being crushed through the falling down of a part of a structure certified to be dangerous.

Then we have other sections called into question. The report refers to a case in which the magistrate dismissed a summons taken out against a builder for erecting a building in Moscow-road having the boundary of the forecourt at less than the prescribed distance from centre of road, because he held that, as the building itself was at the prescribed distance, no power to proceed was given by section 14, which merely applied to a building or structure erected within such distance. As the report says, this and the preceding section (13) make it clear that no part of the forecourt, boundary fence, or wall in front should be at less than the prescribed distance from centre of road; but the High Court dismissed the Council's appeal, and the magistrate's decision was confirmed. The Court admitted the intention of the section, but that in section 14 it was not expressed, and it was a slip which should be amended. Section 14 certainly does not read very clearly; it states that "any new building or new structure is erected at a distance, &c.," but it does not clearly apply to the forecourt or space in front, or to any boundary fence or wall. Section 200 is also desired to be amended. The report states that sub-paragraphs (*a*) (*d*) and (*e*) of sub-section 3 of section 200 should be taken out of that sub-section, and themselves be placed in a separate sub-section providing a penalty for offences which these paragraphs deal with. One relates to the general line of buildings, and the other to wooden and other structures. These sub-sections should not have been included in the sub-section of which they now form part. Section 13 (5) is also taken exception to. It provides that no dwelling-house to be inhabited by the working class shall, without consent, be erected or re-erected within the prescribed distance to a height exceeding the distance of the front of, or nearest external wall of, such building from the opposite side of such street, &c." The amendment proposed is that no working-class dwelling shall be erected within 20ft. from the centre of the street or way on which it abuts, which was clearly intended, although the section does not set out the intention. Other sections which we have noted from time to time in the Act are ambiguously worded, and may often be turned to the disadvantage of the Act by unscrupulous builders; but those we have mentioned have been fruitful of litigation, and the London County Council have prudently taken the course they have in the interests of justice.

THE SOCIETY OF ARCHITECTS.

THE ordinary monthly meeting of the Society of Architects was held at St. James's Hall, Piccadilly, W., on Thursday evening in last week, Mr. T. Walter L. Emden, J.P., L.C.C., the President, in the chair.

ACCOUNTS FOR ARCHITECTS.

The following paper on this subject was read by Mr. Henry Calder Marshall, F.C.A.:—When my friend Mr. Henry Adams wrote to me asking if I would read a paper to the members of the Society of Architects, I felt very much inclined to refuse the invitation, wondering what there could be of mutual interest to the two professions, so I asked myself the question, and the answer was suggested: "As accountants live in houses designed by architects, so surely architects must or should keep their accounts on lines drawn up by an accountant," and in lively hope of gathering some useful material upon which to build up the fabric of accounts, I called upon two architects of my acquaintance. In reply to my questions as to how they kept their accounts, and what books they made use of, Architect No. 1 replied, "Accounts! books! Oh, yes! I have my bank pass-book and keep a letter-book: now, what more can I want?" Said architect No. 2, "I keep a letter-book and have my bank pass-book, and they are quite enough for me." I feel sure that there are very many professional men who keep no accounts at all, or who have a system of accounts somewhat similar to my friends', consisting of a banker's pass-book and a letter-book, totally inadequate either to the requirements of their business or even as a record of their household and personal expenditure. I would, therefore, call your attention firstly to the necessity and advantage of keeping proper accounts; and, secondly, to a simple system of accounts, suitable for the profession of an architect. Firstly, then, as to the

NECESSITY AND ADVANTAGE OF KEEPING PROPER ACCOUNTS.

Amongst other purposes, accounts, proper and correct, may be required for the following:—(*a*) Showing the amount of business done, for the purpose of admitting a new partner or for partnership adjustments; (*b*) showing the profits for the purpose of Income-tax, or for production to the assessors or commissioners; (*c*) for production to bankers or others in the case of requiring a temporary loan; (*d*) for production (if necessity requires it) in the law courts; (*e*) for showing profits, in order to arrive at the value of the goodwill, and for ascertaining the amount of outstandings, for the preparation of the accounts for probate, or for the administration of an estate in the case of intestacy; (*f*) and last, though not least—but let us hope it will never be required by anyone here this evening—for the purpose of the deficiency account under the Bankruptcy Act. Let us now deal with each of these questions *seriatim*.

PARTNERSHIP ADJUSTMENT.

(*a*) Suppose an architect in practice finds his business increase in such a way that the work becomes too much for him. He requires a

partner to bring in a certain amount of capital, and to relieve him of some part of the work. The architect, knowing that he has a good and well-established connection, is not particularly anxious to let anyone come in and take a share of his hard-earned business for nothing, so decides to make the incoming partner pay a good round sum for the goodwill, and arbitrarily fixes an amount. The incoming man demurs at the figure asked, and inquires how it has been arrived at. "Oh!" says the architect, who, like my friends, relies on his bank pass-book, "look at what my takings have been." And so he takes the total of the "payments in" side of the pass-book, quite oblivious to the fact that there might be items received in the business that have not been paid into the bank, and, *vice versâ*, there might be sums paid into the bank that do not pertain to the business; there might also be loans which would go to swell the total, without really, of course, being takings of the business; there might, also, be amounts of cheques returned for re-endorsement and paid in a second time, and above all the pass-book might be wrong; bankers' clerks, like other men, are not infallible. On the other side there might be loans repaid and cheques paid in but returned for endorsement, and certainly, any cheques that have been drawn, but not presented, would not appear in the pass-book at all. The banker's pass-book is all very well and useful for showing the state of your banking account at any given date, but for no other purpose. It cannot take the place of a properly drawn up and correctly kept cash-book. The incoming partner objects to taking only the pass-book figures, so an accountant is called in, who with a great deal of perseverance and at a considerable expenditure of time, and at the expense of the architect, produces an account by analysing the pass-book and writing up a proper cash-book therefrom, and from the counterfoils of the paying-in book and cheque-book, and going carefully and systematically through the letter-book, and writing up commission-book, &c., from it. This account shows the profit to be considerably less than it was thought to be, and, much to the chagrin of the architect, the negotiations fall through. Now had there been an adequate system of accounts showing properly the takings and the net profits of the business, correct figures would have been submitted in the first place to the proposed incoming partner, and the negotiations would probably have been carried through to the satisfaction of all concerned. Of course, where a partnership has already been entered into, it is more than ever a necessity to keep true and correct accounts, and to have a proper system of bookkeeping. Do we not often hear of disputes and disagreements between partners, and of final adjustments of partnership accounts? You will quite see that with only the pass-book before us we get no information on the following points essential to the making up of a correct balance sheet and profit and loss account:—(1) Money owed and owing at the commencement of the financial year. (2) Money owed and owing at the close of the financial year. (3) Business in hand, both at the commencement and end of the year. (4) The separation of capital and revenue accounts, and the raising of accounts for the depreciation of leases, furniture, &c., also the reserve for bad debts. It is clear, therefore, that the pass-book does not have a very prominent place in a system of bookkeeping. It is a useful book, but only in a subsidiary way, as a means of showing the state of your banking account, and for reconciling therewith the balance of cash as shown in your cash-book, but it does not show either the gross takings or net profits of your business.

INCOME-TAX ASSESSMENT.

(*b*) Accounts may be required for the purpose of showing the profits for Income-tax or for production to the assessors or commissioners. How many complaints we hear on all sides of the iniquity of the Income-tax and the unreasonableness of the assessors and commissioners. Of the iniquity of the tax I have nothing to say—it has been imposed and we must submit, cheerfully if we can. There is not a single individual who would not rather be in a position to pay the Income-tax collector a larger sum than he already does. With only a pass-book I do not see how the Income-tax return can be properly filled up, and the ratepayer stands a chance of cheating either himself or the Government, if he relies upon getting his information from that source alone. The pass-book might contain dividends from which the tax has already been deducted, and he would be paying twice over—a thing nobody ever wishes to do. If you have a properly drawn-up balance sheet and profit-and-loss account before you, the matter becomes much easier, and should you be called upon to appear before the Income-tax authorities you will have some reliable data to go upon, especially if your accounts have been made up or audited by a duly qualified accountant.

TEMPORARY LOANS.

(*c*) Accounts may be needed for production to bankers or others in the case of requiring a temporary loan. It may be that a time comes when financial assistance is required to tide over some temporary difficulty—the architect naturally turns to his bankers for such assistance. The first question that will probably be asked is: "Where are your accounts?" If the answer is "Oh, I keep none, I rely on my pass-book," there is every likelihood that he will be politely told that the money cannot be advanced. See in how much better a position the man is who can produce a properly drawn-up balance sheet and accounts, especially if the figures have been verified by a chartered accountant; even if the profit and loss account only show a small margin of profit. The banker sees that his client is a careful man. In the balance-sheet he finds a statement of his client's liabilities and of his assets, and can judge therefrom as to his solvency, and consider whether or no it would be prudent to make the loan. (*d*) Accounts may be required for production as evidence in the law courts. In such a case how awkward it would be if you had only a bank pass-book to produce, as nothing satisfactory can be got from it. You may, through not having proper books, lose your case, and retire from the court a wiser and a sadder man, determined, perhaps, to keep your books on some proper system, and not to rely any longer on the broken reed of a pass-book.

PROBATE.

(*e*) Accounts may be required for showing profits in order to arrive at the value of the goodwill, and for ascertaining the amount of outstandings for the preparation of the accounts for probate or for the administration of an estate in the case of intestacy. We appoint our friends executors of our wills; but do we, at the same time, try to ease their work by having our accounts in such order that, when we are called to "join the great majority," the work we leave our executors to do is comparatively easy and straightforward? Not if we only leave them a bank pass-book and letter-book, together with a chaotic mass of vouchers and papers to wade through. Poor executors! ill requited by the legacy of twenty-five or even fifty guineas mentioned in the will.

BANKRUPTCY.

(*f*) Accounts may be required for the purpose of the Deficiency Account under the Bankruptcy Act. The Deficiency Account is to the perplexed and harassed bankrupt the most unsatisfactory of all the forms he has to fill up. It is so difficult to account for the disposal not only of your income but of your deficiency—that is, the difference between your assets and your liabilities; even with properly-kept books it is no easy task, and woe betide you when you appear before the Official Receiver with an unsatisfactory deficiency account. Then there is the penalty attached to the neglect of keeping a proper system of accounts. The Act provides that under certain conditions, and on proof of certain facts, the Court shall suspend the discharge of the bankrupt. One of the facts reads as follows:—"That the bankrupt has omitted to keep such books of account as are usual and proper in the business carried on by him, and as sufficiently to disclose his business transactions and financial position within the three years immediately preceding his bankruptcy." The meaning of this is that his books must be kept in such a way as to show at once, without the necessity of investigation by a skilled accountant, the state of his business. So far I have been trying to prove by a negative argument, if I may so term it, the advantages of keeping proper accounts, or I should say, the disadvantages of not keeping them—let us in a few words try to prove the same by a positive argument. We all like, I take it, to know how we are going along, what profits we have made during the year, so that we may perchance be able to launch out a bit, or put by something for a rainy day, or indulge in some extra luxury. How much more we enjoy these things when we know the money is really earned and that our accounts are all correct! Besides, without an adequate system of bookkeeping, how can we look after our business efficiently, or know all the necessary details? Should, however, fortune frown on us, and our accounts show a loss instead of a profit, how much better it is to face the difficulty and to know the worst at once. In France and other countries where the Code Napoléon prevails, it is obligatory for everyone in business to keep proper books, and not only so, but in the case of one book, "the journal," each page is numbered and stamped as *visé* by the President of the Tribunal of Commerce, the mayor or other authority. No blanks, erasures, tearings out, or additions of pages are allowed, and you are only permitted to have one journal at a time, which when finished is so marked before a new one is allowed to be commenced.

ARCHITECTS' BOOKKEEPING.

Let us now turn to the second part of our subject—"A simple System of Accounts suitable for the Profession of Architects"; but before doing so, I would very briefly say a little on the rudimentary principles of bookkeeping. What is bookkeeping? It may be defined as the art, science, or method of recording the financial transactions of a business or person so as to show at a glance, at all times, the value of the whole estate or capital, and each of its component parts, in a clear and concise manner. It shows whether capital has been increased or diminished, and by what means such gain or loss has been effected, and also the state of the account between the professional or business man and the person or persons with whom he has transactions. The component parts of an architect's business may be summed up as follows:—Cash (either at bank or in hand), fees (commission or otherwise), perhaps bills and debtors, lease, furniture, &c. These, after deducting creditors and other liabilities, form the capital or estate—and it is to show how these can be exhibited in a way that shall be at one and the same time both comprehensive and concise that I am here this evening. There are two systems of bookkeeping, one named "single entry," and the other "double entry." We will leave the first or "single entry" alone altogether, as being incomplete and unsatisfactory, and deal only with the system called "double entry." But do not run away with the idea that "double entry" means double work. It does certainly entail a little extra work, but this is far more than compensated by the "double entry" being both correct and in every way more satisfactory. There are two sayings or axioms in connection with bookkeeping by "double entry" which cannot be too strongly reiterated. These are: "Every debit requires a credit" (and consequently "Every credit requires a debit") and "In debit out credit." The first is the foundation of the system, and the second is a short and trite way of explaining that a man should debit himself with all he receives, and credit himself with all he gives out. The page to your left hand in a ledger is called the debit side, and that on the right the credit side; and it must not be forgotten that every entry on the one side must have a corresponding entry on the other side, either in a single amount or in an amount made up of the several items. The totals of all the entries on the debit side should agree with the totals of all the entries on the credit side. In one of our ablest works on bookkeeping, the writer says: "Bookkeeping creates nothing, it merely records transactions as between a giver and a receiver, the giver (as an individual or an aggregate) being credited with what he gives, while at the same time the receiver (as an individual or an aggregate) is debited with what he receives, and thus the balance is always kept equal" (Gérard van de Lindes' "Bookkeeping," page 2). And so we come back to our quotation, "In debit out credit." Let me give you an example. Our architect renders a bill of costs; what goes out and what comes in? The architect has given out his services, therefore the amount at which he values his work is placed to the credit of fee account, and the client to whom the bill is sent becomes the debtor, so we debit his account with the amount. Now, what happens when the account is paid? The money comes in to cash, therefore cash is debited, it goes out of the client's account, therefore the client is credited with the amount. Again, you buy some goods; what come in? The goods. Therefore you debit goods or purchases account

What goes out: Why, your indebtedness to the seller of the goods; therefore you credit his account with the amount. When you pay for the goods, what happens: You take the money out of your bank; therefore you credit cash and you put it to the seller's account, therefore you debit him. Take the case of bills receivable. A man owes you money; he is debtor in your books for the amount. He gives you a bill, at say one month; that bill is a bill receivable. You say he has given me the bill in discharge of the debt, and until the bill becomes due he is no longer my debtor, therefore you credit his account with the amount, and as every credit must have a debit, you debit, what?—bills receivable, for it is this account that now owes you the money. When the bill is paid, you debit cash and credit bills receivable. Take the converse: you owe money and give a bill at, say, one month. This bill is a bill payable. The client to whom you gave the bill was a creditor in your books, but directly you gave the bill he ceases to be a creditor until the bill becomes due. So you debit his account and credit bills payable, and when you pay the bill you debit bills payable and credit cash. Bear in mind that there is always a *raison d'être* in all these entries. Leaving the matter of bookkeeping in the abstract, for the time being, we will turn our attention to what I would consider a satisfactory system for an architect's office, and, in doing so, will you kindly imagine that I have been called in by a firm of architects (who up to this time have only had a letter-book and bank pass-book) to arrange a scheme of bookkeeping for use in their office. They wish me to provide for all contingencies, and to frame for them a very complete system. They are not frightened at detail, being accustomed to that in the work of their own profession. I can find no book dealing with this special work on the shelves of our library, so I and my partners put our heads together to do the best we can for our clients, keeping the work as simple as possible, and remembering that we shall have to audit the accounts at the close of the year. We have already been in and analysed the pass-book, and have gone through their letter-book, and have been able, with the aid of various vouchers, invoices, &c., to draw up a statement of assets and liabilities to form the basis of the new system. There are

FOUR IMPORTANT MATTERS

taken into consideration in arranging the books:—(1) Bookkeeping as between the work or commission and the client. (2) Bookkeeping as between the work or commission and the architect. (3) Bookkeeping as between the client and the architect. (4) Bookkeeping as between the architect and his partners, or the internal work of the architect's office. I will now give you a list of books, and I hope you will not be staggered at the number. I do not say that they are all absolutely necessary: but, as you will remember, I was called in to prepare a scheme for a very complete system. Special books: 1, instructions book; 2, register of plans and drawings; 3, specifications, estimates, and sub-contract book; 4, certificate book; 5, contract book. Financial books: 1, commissions book; 2, cash book; 3, petty cash book; 4, journal; 5, ledger—clients; 6, ledger—private. Subsidiary books: 1, register of letter—inwards; 2, postage book; 3, press-copy account book; 4, press-copy letter book; 5, wages book. Before entering upon particulars of each of these books, I would ask you to bear in mind the following

FUNDAMENTAL RULES,

which the firm of architects, at my suggestion, willingly acceded to:—(1) Every commission work or job to bear a distinctive name or number, corresponding to the number given to it in the instructions book. (2) Every penny of cash received in the business to be paid into the bank and not used for petty cash purposes. (3) All books to be closely written up—say daily. This is most important in the case of books of initial entry, such as instructions books, &c. (4) No account or letter to go out of the office without being press-copied in the book provided for that purpose. (5) No payment to be made out of petty cash without having a voucher for the same. (6) All vouchers, both for cash payments and petty cash payments, to be filed in numerical order. (7) No posting allowed from one ledger account to another, except through the journal. A plainly ruled foolscap book is all that is necessary for an instructions book. It should have an index, so that any entry can be easily referred to. In this book are entered up under a distinctive number all the particulars of each work or commission that comes into the office, with rough sketches, notes, &c., from the client's instructions. It is not necessary to restrict each entry to one page, as, if the work is considerable, the particulars would occupy more space; thus, the particulars of building a church or town hall would occupy more space than those pertaining to alterations in a private house.

EXAMPLE OF ENTRY. No. 1.

Church of St. Andrew's. Slumpton.

1st January, 1898. Called by request on the Rev. Robert Spalding, and received instructions to make plans and drawings for a new church, cost not to exceed £5,000. Viewed the site, and made rough ground-plan.

5th March, 1898. Submitted plans and drawings, met the committee, and arranged to make an alteration by the addition of a side chapel—and so on.

EXAMPLE. No. 2.

W. Johnson. Klondyke House, Goldborough.

4th February, 1898. Received instructions from Mr. Johnson that he wished to construct a billiard-room to Klondyke House, drawing plans and meeting surveyor and builder, &c.

This book is, as it were, a complete history of each commission, the closing entry being account sent in such and such a date, the want of such an entry showing that the commission is still open, and that it has not come into the financial books. The instructions book should be under the continuous inspection of the principal, and I would also advise that the architect have small memorandum books—one for each job, for facility in carrying about. In these would be jotted down roughly notes, &c., for transcription into the instructions book.

REGISTER OF DRAWINGS.

No.	Date.	Name of Job.	Description.	No. of Drawing.	Date sent out.	Date Returned.	Remarks.

This is a very useful book, as by its aid the working-drawings of any building can readily be referred to without the necessity of turning over a pile of plans to search for the one wanted. A place for every drawing, and every drawing in its place, would be a good motto for an architect's office. A column is given in which to note the date and number of copies supplied to builder, as if more than one drawing is required an extra charge may be made. Specification, estimate, and sub-contract book: An ordinary guard-book (with an index), for gumming in the various specification and quantity sheets, which form the basis on which the estimates are prepared and contracts fixed: also for estimates and contracts themselves. If closely kept up and indexed, this book will be found most valuable. Certificate book: This is a counterfoil book containing the usual certificates, with builders' receipt form on the back. On the counterfoil should be noted the distinctive number of the commission, with details, showing amount of contract, amount certified, and balance.

CONTRACT BOOK.

Contract No.
Name.
Description of Building.
Builder's Name.
Contract Date.

Accepted Tender.	Name of Contractor.	Certified Instalment.			Commission.		Remarks.
		Date.	No.	Amount	Rate.	Amount.	

This will be found a useful book for showing the state of the work as between the contractor and the client. It is posted up from the instructions and certificate books—a page being given for each commission. It contains particulars of contract number, name, description, contractor's name, contract date, amount of accepted tender, instalments as per certificates, number, date, amount, commission. By adding the last columns it will be seen what the work has cost the client up to a given date.

COMMISSIONS BOOK.

Date.	Particulars.	Folio Account Book.	Folio Ledger.	Detail.	Total.

When an account is about to be rendered to a client, the architect ascertains from the contract book the amount of commission chargeable, or, if the work has never reached that stage, he refers to the instructions book, and ascertains from it what work has been done, and charges accordingly; the account is then copied in the press-copy account book, which thus becomes a book of initial entry. From there the accounts are entered periodically into the commissions book, giving the date, the name of the client, the folio from the account book, detail of amount, and total. From this book it is posted to the debit of the client in the client's ledger. At the end of the month the commissions book is added up, and the total placed to the credit of fee account, thus completing the "double entry."

Dr. CASH BOOK. *Cr.*

Date.	Particulars.	Folio.	Discount.	Details.	Paid into Bank.	Date.	Particulars.	Voucher No.	Ledger Fol.	Discount.	Details.	Cheques drawn.

In giving a ruling of this book, I remember the rule that every penny received is to be paid into the bank. The columns provided are, on the debit side, date, particulars, folio, discount, details of cash, paid into bank, and on the credit side, date, particulars, number of voucher, folio, discount, details, cheques drawn. All the items on the debit side are posted to the credit side of the ledger, and all the items on the credit side are posted to the debit side of the ledger. In the case of any discount being allowed to the client, it is entered in the discount column and the net amount entered in the details of cash column, the discount being posted to the client's credit along with the cash. At the end of the month, the total of discount allowed column is posted to the debit of discount account, and the total of the discount received column to the credit of discount account. It is not generally considered necessary to have an account in the ledger for "cash," as the cash-book itself serves for a ledger account, so that the total of the debit balances of the ledger plus the balance of the cash-book, if representing cash in hand and at the bank, should agree with the total of the credit balances of the ledgers plus the balance of the cash-book in the event of the banking account being overdrawn. To reconcile the cash-book with the pass-book we take the balance of the latter, and if in our favour we add any amounts paid into the bank, but not yet placed to our credit by the bankers, and deduct the amount of any cheques drawn but not yet presented. The balance should agree with the balance of the bank column in the cash-book, the balance of the details column representing cash in hand not yet paid into bank. If the rule is maintained that every penny received must be paid into the bank, it follows that the only way that money can be obtained for petty cash purposes is by drawing it out of the bank specially. It is as well to do this in round sums—say, sufficient to last a week. The ruling for this book shows cheques from bank, date, particulars, voucher number, total paid, and a number of columns for collating payments under different heads, such as drawing materials and stationery, office expenses and postages, wages and travelling, and special ledger accounts, this last having columns for folio and amount. The balance between cheques from bank and total paid columns shows cash in hand, the other

PETTY CASH BOOK.

Cheques.	Date.	Particulars.	Voucher No.	Total Paid.	Drawing Materials and Stationery.	Office Expense and Postages.	Wages and Travelling.	Ledger Accounts. Folio.	Amount.

columns are added, and the tota's posted to the debit of the various accounts in the private ledger, except the special ledger account column, where the items are posted separately.

JOURNAL.

Date.	Particulars.	Folio.	Debit.	Credit.

This book is most useful, and yet it is one of the best abused books, perhaps because not thoroughly understood. Fundamental rule 7 states: No posting allowed from one ledger account to another except through the journal. Supposing an error had been made, and J. Smith debited with £100 instead of T. Brown, the journal comes in, and an entry is made:—

T. Brown,	Dr.	£100 0 0	
To J. Smith			£100 0 0

For this amount posted to latter's account in error.

But it is not only in cases of error that this book is useful, but also in the analysis of accounts, and at the close of the financial year for making up the profit and loss accounts. In days gone-by it was customary for every transaction to pass through the journal, and well do I remember the time—now some 30 or more years ago—being seated at a desk in a merchant's office, journalising every item from the cash-book, petty cash-book, invoice book, account sales book, &c. Those were good old times—when every letter inwards and letter outwards were copied by hand into large and ponderous tomes. I don't know if this was all necessary, or whether it was arranged to provide work for us juniors to keep us out of mischief, or as a means for the improvement of our handwriting. We none of us liked it, but it had to be done, and I don't think any of us were the worse for the discipline.

Dr. LEDGERS. *Cr.*

Date.	Particulars.	Folio.	Amount.	Date.	Particulars.	Folio.	Amount.

I would advise two ledgers being used: the clients' ledger for all accounts with clients, and the private ledger for all accounts pertaining to the internal work of the office. The clients are debited with amount of bills from the commissions book, and any special amounts paid on their account, and are credited with amounts received and any discount allowed from the cash-book. The private ledger should contain such accounts as partners' capital and drawing accounts, fee accounts, the various accounts for expenses, profit and loss accounts, &c. This book is of a strictly private nature, and might well have a lock and key. In very large businesses it would be possible, and perhaps desirable, to have a system, where the books could be balanced from the private ledger alone, by having "sundry debtors" and "sundry creditors" accounts. The other books I suggest do not require much explanation. They are:—Register of letters inwards: giving columns for date received, from whom, on what subject, and date answered; to be posted into the instructions book as required. Postage book: columns for date, to whom, address, postage. Press-copy account book: no account to be sent out without being press-copied; entries to be made from this book to the commissions book, to be kept closely indexed. Press-copy letter book: every letter sent out to be press-copied; this book to be carefully indexed. Wages book: this book should have columns for date, name, amount of wages, the total to be drawn from the bank periodically. I have refrained from giving a set of *pro formâ* accounts, as they are never very satisfactory, but have contented myself by showing the ruling of the various books and referring to the working in the letterpress, leaving you to fill in any imaginary figures you fell inclined to supply. I might have given a ruling for a bills-receivable and bills-payable book. You will find them in every work on book-keeping. They are, however, little luxuries that should hardly come in the way of a professional man, and the more you in your profession as architects, and I in my profession as accountant, can steer clear of them, the better: they always have a peculiar knack of becoming due just when you are least prepared for them. If what I have written induces any of you to discard the bankers' pass-book and letter-book system and adopt something better, I do not think you will regret it, and I shall feel more than amply repaid for any time I have given in the preparation of this paper. Gentlemen, yours is an honourable profession, and so is mine. Our duties are towards our clients, and we must always endeavour to put them first, and ourselves second. And herein we both have the same difficulty to contend against. I refer to the sending in of accounts. You charge a commission on amounts expended, and so the more expended the larger the commission. In my profession we charge by time occupied; therefore the longer the time occupied, the larger our fee. But we are honourable members of honourable professions, and I feel sure that while I would not take longer over my work than necessary to do it well and thoroughly, so I am convinced that you would not cause your clients to spend their money in order to increase your commission. Until someone finds out a better way of arranging our charges, there is no help for it but for us to follow the old paths.

The PRESIDENT said he considered that well kept accounts were very necessary for architects in their business. The lecturer had put his subject in a very pleasant manner, but it was possible that the books suggested were more elaborate than would be required, and would entail the employment of at least another clerk. One of the difficulties the architect had to fear was that they would estimate the cost to clients of work but not to themselves. It was not easy to apprise the value of their own services and abilities except on the unsatisfactory system of percentage commission.

Mr. S. A. MIDDLETON proposed and Mr. G. H. GUILLAUME seconded a vote of thanks to the lecturer, the latter remarking that the system proposed was, he feared, too elaborate for the ordinary architect, who was satisfied with the entries in his diary, letter-book, and passbook.

Mr. SILVANUS TREVAIL, of Truro, remarked that architects were not as a rule strict accountants, but such a system as had been suggested was suitable for men with gigantic practices, such as Mr. Waterhouse. Mr. Marshall had named a formidable list of books as necessary, and he should like to know if some of those could not be dispensed with. In a provincial business the accounts could be methodically kept in three or four small books. He must admit, however, that architects frequently lost small items, such as travelling expenses, and postage, and telegrams, through not booking them at the right time to the particular client. He thought the 5 per cent. commission plus actual out-of-pocket expenses fairly met most cases; but in some instances—as where an architect had to face an infuriated mob of a thousand to twelve hundred men who contested a right-of-way over the site—this might seem inadequate.

Mr. W. COOPER, of Hastings, also thought that, while the plan suggested might be the ideal one, it was too elaborate for any except large London practices.

The vote of thanks having been passed by acclamation, Mr. CALDER MARSHALL acknowledged it, remarking that if architects complained that correct book-keeping would compel them to employ an extra clerk, he should say, by all means employ the additional man.

SURVEYORS' INSTITUTION STUDENTS' PRELIMINARY EXAMINATION.

OF the candidates who presented themselves at the preliminary examination of this institution, held concurrently in London, Manchester, and Dublin on the 19th and 20th ultimo, the following satisfied the examiners:—

Rowland William Alderson, Royal Agricultural College, Cirencester; Fred Tregarthen Allen, 6, Lawn Villas, Wisteria-road, Lewisham, S.E.; Charles Edward Amoore, 58, Gresham-road, Brixton, S.W.; Algernon Lawrence Berry, 1, Spencer-road, South Croydon, Surrey; Ernest Witton Booth, The Grove, Ilkley, Yorkshire; Cecil Gustave Bradley, 103, Tettenhall-road, Wolverhampton; Thomas Brent, Fairlight, Shrewsbury-lane, Shooter's Hill, Kent; Hubert Brooker, Elinbank, Steyning, Sussex; Eustace Montague Browne, Court House, Kingsthorpe, near Northampton; George Joseph Bruzaud, The Vicarage, Addleston, Surrey; Alfred Eustace Buckley, South Field, Halifax, Yorkshire; William Burman, Kiveton Park, near Sheffield; Thomas Lingfield Caton, 82, Acre-lane, Brixton, S.W.; Charles Vyvyan Chilwell, 6, Weymouth-street, W.; Robert Cobb, Mockbeggar, Higham, Rochester; Arthur George Steuart Cooke, Ashbourne, Derbyshire; George Frederick Cotching, West Lodge, Horsham, Sussex; Adolph Henrich Dallschaft, 21, Drayton Park, Highbury, N.; Thomas Dann, Gwynant, Overcliffe, Gravesend, Kent; William John Dixson, Codicote Vicarage, Welwyn, Herts; Cyril Henry Doone, Leek Wootton, Warwick; John Wilfrid Earle, Allerton Tower, Woolton, Lancashire; Charles William Eastwood, 38, Yorkersgate, Malton, Yorks; Charles John Elgar, Crockshard, Wingham, Kent; Henry Etlinger, care of Mr. J. S. Kincaid, 7, Leinster-street, Dublin; Frederic Fletcher, Myddelton Lodge, Whetstone, N.; Walter Foster, Armaside, Hampton Hill, Middlesex; William Fox, 15, Holdenhurst-road, Bournemouth, Hants; Cecil George French, 6, Bedford-terrace, Bedford-road, East Finchley, N.; Kenneth Graeme Gairdner, 24, West-hill, Highgate, N.; Allen Gimson, 32, Fitzroy-square, W.; Edward Brougham Glazier, Edgecombe Hall, Wimbledon Park, S.W.; James Caulfeild Goff, Agricultural College, Aspatria, Carlisle; Frederic Allen Sturge Goodbody, 35, Paradise-street, Birmingham; Alfred Goodman, 4, Clapton Common, N.E.; Ronald George Gurney, Brook-street, Aylesbury, Bucks; Clement Arthur Hall, 36, Gordon-place, Kensington, W.; Graham Harding, 66, Cannon-street, E.C.; Cecil Pryce Harrison, Caerhowel, Montgomeryshire; Ernest Harrison, "Westbrook," Bolton-le-Sands, near Carnforth, Lancashire; Sydney William Hider, 80, Upper Tollington Park, N.; Eric Cecil Hill-Whitson, 14, Agnew-street, Lytham, Lancs; Joseph Henry Hinchcliff, 13, Brudenell-avenue, Hyde Park, Leeds; Michael Anselm Hindmarsh, Cray View, Alnwick, Northumberland; Robert Thomas Hodge, Kelvin, Cottenham-park, Wimbledon, Surrey; Charles James Hudson, Armley House, Bridlington Quay, Yorkshire; Alfred Colin Hughes, 393, Moseley-road, Birmingham; Harry Hunt, 71, Parliament Hill, N.W.; Percival Hurlbutt, College of Agriculture, Downton, Wilts; Cecil Walter Ingram, 2, St. Andrew's-place, Lewes, Sussex; Frederick Johnson, London House, High-street, Erith, Kent; *Arthur Bayly Jones, 6, Hatherley-road, Kew Gardens, Surrey; Herbert Davies Kelleway, 24, Bateman-street, Cambridge; Philip Reginald Kemp, care of G. E. Gregson, 11, Chapel-street, Preston, Lancs; Frederick Charles Knibb, 34, Honeywell-road, Wandsworth Common, S.W.; Harry Lisney, 11, Sydenham-road, Sydenham, S.E.; Charles Living, jun., 125, Broadway, Plaistow, E.; Philip John May, 25, Compton-avenue, Brighton, Sussex; Thomas James Mercer, 15, Warwick-row, Coventry, Warwickshire; Herbert Arthur Mitchell, 105, Western-road, Brighton, Sussex; Charles Evelyn John Monson, The Avenue, London-road, Newark-on-Trent; Charles Percy Moss, 58, Ashley-road, Crouch Hill, N.; Alfred Edward Oaten, Glenthorpe, Fairfield-road, Montpelier, Bristol; Hugh Earl Perks, 2, St. Paul's-square, Bedford; George Louis Pottier, 2, St. George's Villas, Whipp's Cross, Walthamstow, N.E.; Charles Edward Rawlins, 13, Grove Park, Liverpool; Harold Thomas Richardson, 52, Southbrook-road, Lee, S.E.; Henry Hubert Riddle, 139, Trinity-road, Tooting, S.W.; Gilbert Charles Rowe, Beechwood, Langley Park-road, Sutton; Willoughby John Shaw, Yorkshire College, Leeds; Leighton Edward Shone, Woodhouses, Whitchurch, Salop; John Henry Simpson, Middleton Stoney, Bicester, Oxon; Walter John Slipper, 16, Duke's-street, Chelmsford, Essex; Cyril Herbert Smith, Buckhill, Calne, Wilts; Quentin Cullen Smith, 7, Grosvenor Gardens, Muswell Hill, N.; Harold Soper, 43, Buckingham-place, Brighton; Frank Ewart Spalding, 3, Lyndhurst-road, Hampstead, N.W.; Percy Abel Stanley, Newton-road, Burton-on-Trent, Staffordshire; Frank Edward Strudwick, 41, Park-road, Bromley, Kent; Gerald Drysdale Sweetman, Windsor House, 13, St. Thomas'-street, Ryde, Isle of Wight; Henry John Tilley, Barnhouse, Watlington, Oxon; John Reginald Tonson-Rye, Agricultural College, Aspatria, Carlisle; Ernest Davey Tredinnick, Peoln House, Craven Arms, Shropshire; Jabez Tennyson Turner, 108, Greenwood-road, Dalston, N.E.; Robert Parsons Vale, Church House, Hartlebury, near Kidderminster; Clement Harwood Vince, The Tower House, Halton, near Lancaster; Gerald Douglas Wadham, Millwood, Dalton-in-Furness, Lancashire; Gilbert Russell Walker, The Chestnuts, Long Ashton, Somerset; Leon Maitland Walton, Ingleside, Manor Way, Bexley, Kent; William Henry James Weston, Gloucester House, Ashford, Middlesex; Francis West Wheeler, 180, Fulham-road, S.W.; Lancelot Elce Wilson, 17, Monks-road, Lincoln; Walter Alfred Wiltshire, Fairfield, Reigate, Surrey; Leonord Wragg, Loxley, near Sheffield; Kenneth James Young, 167, Brixton-road, S.W. (* Passed at head of List.)

FIREPROOF CONSTRUCTION OF DOMESTIC BUILDINGS.*

(*Concluded from page* 122.)

UNDER the London Building Act concrete is sometimes filled in between the top and bottom flanges and metallic lathing fixed thereto and under the bottom flange; but it is seldom practical to employ concrete in this way

* By THOMAS PORTER, of Alresford, Hants. A paper read at the Society of Arts on Wednesday evening, Jan. 26, 1898.

more than 3in. thick; it is difficult to apply in a soft state, and is, moreover, a moderately good conductor of heat, and, more important than all, the bottom flange of beam is either insufficiently protected or not protected at all. On the other hand, plastering mortar possesses little more than one-third the conductivity of brick or tile, and if applied so as to leave a hollow space behind, 1½in. in thickness of plaster is more effective than 2½in. of concrete. I am told that asbestic plaster has much less conductivity than common plaster. Captain Shaw, a former chief of the Metropolitan Fire Brigade, wrote some years since in reply to an inquiry on this point, "Very little plaster will suffice to prevent ironwork from melting, softening, or cracking, if only it remains on, but this is the difficulty. Some key is absolutely necessary, and hoop iron or wire netting would probably be found the cheapest and best; with a really trustworthy key about half an inch of plaster would insure safety." When Captain Shaw wrote this, metallic lathing had not come into use. To ascertain for myself the capability of common plastering to resist fire, I built a small brick inclosure 7ft. square and 6ft. high, upon the top of which I laid steel joists and attached thereto a suspended ceiling on expanded metal lathing. When the plaster was thoroughly dry, I made a larger fire under than would be likely to occur in an ordinary room, and after two hours of fierce combustion and repeated quenching the upper side of the ceiling with buckets of water, the plastering remained sound, although pieces of wood an inch thick thrown on the top of the ceiling were ablaze in a few seconds from the heat conveyed through the plaster. I am bound to say the result was quite a surprise to me. The steel joists, although unprotected, were not injured to an extent that would cause them to buckle or expand to any degree, and nearly one hour after the fire was lighted were but moderately hot. A further protection may be practised by plastering the flanges and exposed portions of the beam with asbestic plaster, which adheres better to unpainted metal than to painted. I am unable to speak from experience as to the merits of asbestic; but if the reports concerning it are true, it has some marvellous properties in connection with fireproofing, as regards its resistance both to fire and water. Protected in this form, beams would withstand greater heat than if incased with concrete or terracotta or fireclay tiles, say 2in. thick, as the outer plaster incasement is everywhere disconnected from the beam itself, and forms a valuable and almost invulnerable first line of defence. Doubt has been expressed whether the heated air between the plastering and the beam would not expand and burst the incasement. This can be avoided by fixing an air-brick or tube in the walls upon which the beams rest; anyway, it should not be a difficult point to deal with. Joists in almost every system have their webs incased by the floor materials; the top flanges are much less liable to become overheated than any other portions, but the bottom flanges require greater protection than any other part, as they are at all times subject to a severe tensile strain, and in case of fire the heat is directed full against them. No floor is absolutely safe unless the bottom flanges are efficiently safeguarded. Sir Nathaniel Barnaby, in making experiments in connection with iron ships, found that iron and steel beams gained in strength up to between 490° and 550° Fahr.; beyond this their strength rapidly diminished. The moral to be derived is that if the steel beams and joists used in fireproof floors can be so far protected that they do not attain much over 500° of heat, they take no harm either from loss of strength, from heat, or expansion. Where beams have to be employed it is only reasonable they should be no longer than is absolutely necessary—*i.e.*, they should be disconnected at every bearing where possible. Divided opinions prevail as to whether concrete is reliable as a fire-resisting material or the reverse; this depends mainly upon the materials of which the concrete is made. Thames ballast is one of the worst, and being used at one time for fireproof floors in London, many failures took place, and firemen were cautioned not to enter burning buildings which possessed fireproof floors. The most reliable fire-resisting materials are crushed bricks, coke, breeze, clinker from furnaces, slag from iron ore, pumice, and similar substances which have passed through fire. Mr. Webster's experiments proved that slag made the strongest concrete, broken firebrick came next, and then pumice, while coke breeze was the weakest; but after being heated to a red heat, and quenched with water, the order of things was reversed, for it was found that slag had lost two-thirds of its strength, broken firebrick nearly as much, pumice about the same, but coke breeze less than one-half, and that the latter was then stronger than the other three materials. Neat cement was only about one-fifth its original strength after being heated and quenched; but it was clear that when diffused among other materials to form concrete, its strength from some cause or other was not diminished in the same ratio. But good concrete increases its strength with age, and assuming that a concrete floor will sustain the specified load required at a month, it should carry double that at a year, and from this we gather that if a concrete floor made of coke breeze is exposed to a fire, and becomes nearly red hot—say 1,000° Fahr.—it ought to be still capable when cold of supporting its original specified load, subject to not being weakened from other causes—and here another contingency arises: expansion from heat and subsequent contraction. This appears to be a substantial objection to the use of floors formed of a single slab without joists, or of large self-supporting areas of concrete for floors, whether flat or arched. So far as regards strength, first-class concrete requires no steel beams or joists whatever for floors up to 15ft. between supports, nor any iron imbedded therein. I have, many years since, executed 12ft. spans of a uniform thickness of 4½in. only; but the effect of a fire would be to cause them to expand, and as they cooled to contract, and probably, through being tied into the walls and unable to adjust themselves to circumstances, break up into fragments. Concrete paths in public streets expand and contract with ordinary variation of temperature, and to avoid irregular cracks, are executed, as we know, in sections of about 9ft. square. But as the temperature in a house-fire scarcely exceeds, we are told, 1,000°, there should be no difficulty in so protecting the beams, the joists, and the concrete that neither should, in an ordinary house, be exposed to a temperature of more than 500° one hour or longer after a fire has got well alight. Cement concrete has some peculiar properties: for instance, it is not considered by any means an elastic material, but I have seen a slab 10ft. in length and 4½in. in thickness deflect over an inch in the centre under a heavy load, and resume its original shape within a quarter of an inch, after having been weighted for several days. So that any perceptible movement or deflection of a concrete floor in walking over or jumping upon, does not necessarily imply danger. This is, however, not a pleasant sensation when the floor is known to be of concrete, and to avoid this a flat floor has to be thicker than is absolutely necessary for strength. A segmental arch-shaped floor has an advantage in this respect, for no matter how light it may be, it is practically rigid. A flat slab floor without joists has another disadvantage—viz., the effect of ordinary changes of temperature, as before described. The difference of temperature in the rooms of a dwelling is never very great, but combined with the tensile strain on the lower half of the floor, it is sufficient to cause slight cracks in the concrete on the under side, as the result of a change from heat to cold, and, although I have never known an accident result therefrom, cracks are naturally looked upon, and with good cause, as elements of danger. These cracks may not develop for a year or more after the floor has been completed, and if covered on the top with a wood casing, and the under side is plastered, they may never be visible. Then another objection to slab floors is that the lower half, or half below the neutral axis, is undergoing a tensile strain, a strain which concrete is least liable to resist, and these combined disadvantages go to prove that although flat floors of concrete without any joists are economical in cost and space, they are not adapted for rooms of domestic buildings. They may do very well for corridors, passages, lavatories, and the like, always remembering that concrete conveys sound more readily than any other building material; as an instance, conversation carried on in an ordinary tone in a room divided from another by a 6in. concrete partition, plastered on both sides, can be heard in the adjoining room; this I state from experience. Another type of floor is the same as the one just described, but has steel or iron rods, wire netting, expanding metal, or any other form of steel or iron imbedded in the concrete below the neutral axis, for the purpose of counteracting the tensile strain. Floors of this character have been advocated for years, more especially those of Hyatt, Branmon, Monier, Edwards, the Expanded Metal Company, and several others. The main point is to prevent shearing of the imbedded material, and this is usually obtained by securing the ends of the metal ties in the concrete. The strength of concrete floors is largely increased this way; but the general disadvantages of the slab floor just described are still the same, and if large areas of concrete have to be divided into smaller by means of steel joists, I fail to see much advantage in the use of imbedded metal. The so-called solid concrete floor is more largely used than any other, principally because it costs less, can be executed by the builder, and came into use at a time previous to the general introduction of better systems. Joists are usually fixed 2ft. to 6ft. apart according to circumstances, and the concrete kept an inch below the bottom flange with the object of protecting the beam from fire, and a plaster ceiling is formed on the concrete. The objections to this form of floor, from my point of view, are—(1) that the one-half portion of concrete below the neutral axis is of little use so far as regards strength; (2) it conveys sound very distinctly; (3) the concrete having to be of a thickness equal to the depth of joist, plus the inch below, is very heavy; (4) the cost is thereby enhanced; (5) in case of fire, the under portion may become very hot before the heat reaches the upper portion; owing to the thickness it has to permeate, expansion in some places and none in others creates rupture of the particles, and, cohesion being weakened, masses may fall away, or if expansion occurs from heat, rupture of the concrete will take place at its weakest point, and that is where it incases the bottom flanges of the joists, which is only 1in. in thickness; should this happen, and the fire is extensive, the fate of the floor is settled, although in an ordinary way it should scarcely be sufficient for this; (6) plastering on concrete surfaces of this character to form ceilings has scarcely any key, the concrete surface being simply jagged or indented with a pointed tool, and in case of fire the plastering will possibly soon fall away—indeed, it often occurs without a fire. The weight of a concrete floor of this kind, as shown, 9in. in thickness, is about 40lb. to 50lb. per superficial foot, without the joists, whilst the greatest live load necessary to be provided for floors of domestic buildings is said to be only between 20lb. and 30lb. at most. A modification of this floor so as to reduce the weight of concrete was adopted some years ago, but can scarcely be called a fireproof floor; a better title would be an improved wood floor. These are a description of floors usually performed by any kind of labourers. My experience is that workmen who have acquired an intimate knowledge of concrete floors, and take an interest in their work, perform it in a superior way, produce better work, and are more reliable. Concrete floors which have collapsed have been done by men of no experience. There is an impression that concrete floors of an arch form exercise considerable thrust, and must necessarily be held together by tie-rods and bolts, but, except in large spans, this is not so. Indeed, arch-shaped concrete assumes more the character of a cantilever than an arch. But level ceilings are necessary for rooms of dwelling-houses. This can be obtained by forming them of metallic lathing suspended to the joists, while the vacant space that intervenes creates a barrier to the transmission of sound. Fawcett's floor and Homan's floors are too well known to require any description; they are types of the lintel form of construction, with a portion going under to protect the bottom flanges. Concrete is filled in up to the level of top of joists, and the under sides of the lintels are plastered in the usual way. There are numerous floors of the lintel type—Willis and Astley's, Pickering's, Fergusson's, and others. I offer no opinion as to the relative merits of any patent floors in use. Were I to do so impartially, I could only say that probably they will all safely support any reasonable load; that their cost is very much the same; that each may possibly possess some advantage, more or less, over others; but until a series of tests have been made as to fire-resisting and other desirable properties of some of the best types of floors by independent authority under similar conditions, and upon areas of suitable dimensions, no comparative results are possible. The patentee of every floor can bring ample evidence, without a doubt, to prove that

his system is far better than any other, and also that the severe trial it has withstood against fire in a small test-place 7ft. or 8ft. square, arranged for the purpose, has beaten all previous records; all the same, it is quite a different thing to a fire in an apartment 18ft. or 20ft. each way, and not specially constructed to be tested. My views as to fireproof floors for domestic buildings are:—(1) Steel beams should be avoided as far as possible; up to 24ft. span, or between bearings, they can be dispensed with altogether, and joists of moderate size substituted at but little increase of cost. (2) Where, however, steel beams are necessary, the greatest care should be given to protect them from fire. (3) Steel joists to divide floors, whether flat or arched, should not be more than 6ft. apart, and should also be well protected, more especially the bottom flanges, which, as a rule, are less cared for than other portions; the top flanges are not so important. (4) A better quality of concrete, and less of it than is usual, should be employed to lessen the enormous weight thrown upon walls and foundations. (5) The plastered ceilings should, if possible, be of a character that will not fall or come away as the immediate result of a fire beneath. The properties aimed at in fire-resisting floors of domestic buildings should be as follows: (1) Resistance to fire, (2) non-conductivity of sound, (3) lightness compatible with safety, (4) economy of space, and (5) economy of cost. I have endeavoured to carry out these principles in a floor shown; but although highly successful on a small scale, like everyone else's patents, I am unfortunately unable to say what the result would be in a genuine big fire. The bottom flanges are incased with burnt-clay shields, an air-space intervening, and a metallic lath-suspender ceiling is fixed to the shields by iron hangers and lathing bars; permanent iron centres are used for forming the floor, and the bottom flanges of joists have a double air space protection. The best covering for a concrete floor is wood in narrow widths, nailed direct on the concrete itself. Obviously the floor must be first made quite straight, and the materials of a consistency that will enable nails driven therein to hold equally as well as if driven into wood. It has been said that the wood will rot; but I have done floors in this way for 16 years and found no decay yet, and for some reasons they are preferable to wood block floors and cost less. Dovetailed strips of wood imbedded in concrete for nailing boards thereto I found acquire dry rot and decay more or less in from three to four years. Wood laid on concrete direct will not burn except through the strongest provocation; it will smoulder and become charred. Small wood joists laid on the concrete and floor-boards fixed thereto in the usual way will burn rapidly. It is worthy of being more generally known that cement used for making concrete parts with as much water as is unnecessary for hydration, and clear water can always be seen dripping from concrete newly laid on temporary centring or wood platform formed to uphold it. This is often supposed to be a case of too much water having been used in mixing; but it is not so, unless it is coloured with cement, in which case it is evidence of the latter having been carried through the concrete owing to the use of an excess of water, and the floor is obviously weakened therefrom. As a matter of fact, concrete for any purpose is assumed to be such a commonplace thing that it is difficult to evoke any interest in connection therewith, so far as building matters are concerned. But the large fires which have taken place will, it is hoped, be the means of inducing the London County Council or the Government, or some other independent authority, to make a series of independent tests of various kinds of fireproof floors, partitions, beam incasements, &c., that architects and the public in general may be put in possession of some reliable data relative to so-called fireproof buildings, and if a building was set apart for specimens and exhibits of fireproof floors, partitions, cements, and inventions, and products relating to fireproofing, architects and others would be able to see and judge for themselves as to what would be likely to fulfil their requirements instead of having to rely entirely upon pamphlets, advertisements, or circulars.

The Salford Board of Guardians decided on Friday to purchase twenty acres of land on the Weaste estate, near the Union Infirmary, for £14,000 as a site for the proposed new workhouse.

TILE AND CONCRETE FLOOR TESTS.

WE are not great believers in public tests of materials, but our American cousins seem to place great faith in them. If the conditions are fair, and the experiments are conducted in a natural manner under guaranteed supervision, these trials would be of value; but for some reason or other these conditions do not often prevail. There have been several tests lately in New York city, under the auspices of the New York Building Department, on concrete and tile arches and floors. We lately recorded those conducted by that department, in which the Roebling arch was tested with others. A large firm of manufacturers (Messrs. Maurer and Sons) in New York lately challenged other firms of manufacturers of fireproofing materials to take part in a 24 hour test, and the Roeblings, at the instance of a superintendent of the Building Department, accepted the challenge with certain provisoes—one that the conditions should be the same as those before accepted; but Messrs. Maurer declined those modified terms, and issued an injunction restraining the superintendent from taking part in the test. Several engineers and architects, on behalf of Messrs. Roebling, made the test, however, which resulted, after firing for three hours, in a deflection of 1·4in. for the Roebling arch, and of 3·65in. for the tile arch. The latter gave way between two tie-rods, and an area of 5ft. by 5ft. fell with its load, whereas the Roebling arch is declared to have remained intact, with shreds of the skim coat hanging to the ceiling. The temperature reached 2,000° uniformly applied. The tile construction, however, has established its value as a fireproof construction, from what we hear.

CONSTRUCTION OF ARCHES IN CONCRETE.—XVI.

(Concluded.)

IT only remains for us to sum up in a terse and compact form, the salient results of the experiments, tests, and observations which have been described and illustrated in our preceding articles. In instituting comparisons, discussing merits, and drawing our conclusions with respect to the behaviour of the five large arches of 76ft. in span, we shall not include the last, that is the fifth, on the list of examples, which is wholly constructed of wrought-iron. Our reason is that it is impossible to institute any real or fair comparison between a purely metallic arch and any one of the four other structures submitted to the same trial. The practical conditions between an iron flanged rib and a solid concrete one, or one of concrete strengthened by iron or steel, or between the wholly metal type and arches of brick and stone, are too diverse and wide apart to admit of any useful investigation or discussion with a view to establishing even an approximate similarity of features and properties. In all the four arches there was particular attention bestowed upon two especial cases of loading. One was when the "critical load," as it was termed, was imposed, and the other when the actual breaking load came into active operation. The critical charge was also the load, the application of which gave rise to the incipient cracks and "threads," which subsequently augmented in both size and number, although in indirect proportion, with corresponding additions to successive loads. As has been stated, both the critical and breaking loads varied for each different arch; but it may be remarked that the ratio between these two loads for each individual arch obeyed no law. Table I. has been calculated so as to exhibit the amount of the two loads and the ratio between them. Under column 1 are the loads which produced deformation of the longitudinal axis in the different arches; in columns 2 and 3 are recorded the critical and breaking loads, and the difference between these last two are given in the fourth column. The values are all in tons, with the exception of those in column 4, which are percentages. An inspection of Table I. points out that arches of stone and brick do not vary much in the amount of their ultimate powers of resistance; but so far as the critical load is regarded, the latter is considerably weaker than the former. The concrete arch shows increased strength under both loads, but the three are far surpassed by the Monier cement-and-steel type. It is important to notice here the different causes which led not only to the primary deformation of the longitudinal axis of the arches, but also to the formation of the cracks and fissures. In the structures of stone and brickwork these defects, which manifested themselves after the loads in column 3 of Table I. were superimposed, were due solely to the want of a proper grip of the mortar upon the masonry and bricks at the joints. But in the case of both the simple and compound concrete or cement arches, the cracks were the

TABLE I.

Description of Arch.	1	2	3	4
Stone	35·123	57·014	73·889	30
Brick	34·927	41·793	68·123	58
Concrete	57·147	62·314	83·342	32
Cement and Steel ..	55·711	79·614	145·989	87

result of the action of stresses of a tensile character, and were not developed in the Monier cement-and-steel example until the critical load assumed proportions a good deal in excess of what was sufficient to render them distinctly visible on both faces of the other two experimental specimens. If, therefore, the adherence or grip of the mortar in the stone and brick bridges had been equal to the resistance of the materials of the other two arches against the tensile stresses to which they were exposed, the difference between their respective ultimate breaking weights and critical loads would not have been by any means so great. In order to arrive at a satisfactory conclusion on this point, a series of experiments were instituted to accurately determine what the adherence of the mortar was, and what was the actual resistance of the concrete and cement-and-steel bridges. Let A = the average strength or adherence of the mortar, M the maximum, and m the minimum, values; then—

$$A = \frac{M + m}{2}$$

But adopting the square inch as the unit, the actual tests proved that the values of M and m were respectively in pounds—

$$M = 124. \quad m = 83;$$

from which we find for A that it becomes—

$$A = \frac{124 + 83}{2} = 103{\cdot}5\text{lb. per square inch.}$$

Comparing this with the resistance of the simple concrete arch to the stresses of tension, we find that the value of A in the latter case rose to—

$$A = 233{\cdot}781\text{lb. per square inch.}$$

It is when we take into consideration the result obtained in the Monier arch, built on the combined or compound principle of cement-and-steel, that the advantage of the combination becomes apparent beyond any reasonable doubt. Solving for A we have—

$$A = \frac{880{\cdot}24 + 555{\cdot}37}{2},$$

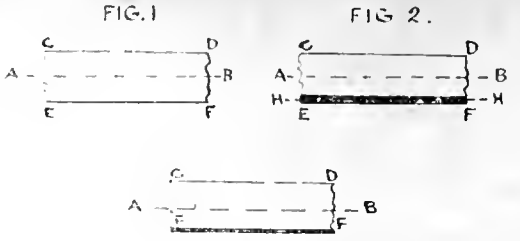
and finally—

$$A = 717{\cdot}855\text{lb. per square inch.}$$

These different values of A in the arches may be compared thus:—Put A_1 for the value obtained for A in the brick and stone arches, A_2 for that in the plain concrete arch, and A_3 for the same in the compound Monier arch; their respective relations will be given by the following equations:—

$A_1 = 3{\cdot}07$; $A_2 = 6{\cdot}93$; A_1 and $A_2 = 2{\cdot}25\ A_1$.

The manner in which, and the points along the elevation of the arches at which, the fissures appeared; their disappearance or closing up after the partial removal of the load, and their subsequent reappearance upon the reimposition of it, and other details, have been fully described in previous articles: so we shall not further recapitulate. By observing the deflections and also the vertical deformations of the arches at the various points where the loads were placed, it was not a very difficult matter to compute the coefficients of elasticity for each; but as the calculations are complex and tedious, we shall give the results only. Thus, for stone, the value of the coefficient was 830,500lb. per square inch, for brick 382,250, for simple concrete 3,382,500, and for the steel-and-cement construction 4,585,625, all in the same units. The importance of the coefficients of elasticity of the different materials in the structures under consideration is evident from the fact that the stiffness or resistance to deformation and distortion is proportional to the amount of these coefficients. It should be borne in mind that in order to render a road or railway bridge unfit for its duty it is not necessary to actually break it down. After it has suffered a certain amount of deflection and deformation, it is placed practically *hors de combat*.



The proof of the statement that the stresses in the two materials—namely, the concrete and the steel—in the compound system of construction are dependent also, as well as the rigidity of the arch, upon their module of elasticity, may be thus expressed mathematically. Let S equal the tensile stress in the concrete at or near the region, where the rod, beam, or other section of steel is imbedded, and put S_1 to represent the stress of the same character in the steel or other metal as the case may be. Put M for the modulus of elasticity of the metallic material, and M_1 for that of the concrete; then the tensile stress on the steel will be given by the equation—

$$S_1 = \frac{M \times S}{M_1}$$

The symbol S_1 will give the value of the tensile stress in pounds per square inch. In thus deducing the stress upon the metallic part of the arch—or, as in the present case, the steel—it is assumed that it and the other material, the concrete, both stretch to the same extent. This assumption is theoretically not quite correct, but sufficiently so for all practical purposes.

The influence which the addition of steel bars or plates have upon the depth of the girder must be taken into account, and the extent to which they will modify that most important dimension in all bridge structures will depend upon their position. Three examples here present themselves which are shown in Figs. 1, 2, and 3. Let Fig. 1 be a short length of a portion of a simple concrete arch, and, for the sake of simplicity, supposed to be straight; then its neutral axis will be represented by the line A B. Put d for the total depth of the concrete rib; then its position will be at a distance from either the top or bottom of the arched rib equal to $\frac{d}{2}$ — that is, at the centre of the rib. In the second case, let a plate shown by the dark line in Fig. 2 be bedded in the concrete, and make d, as before, equal to the total depth of the compound rib, and put d_1 to equal the depth of the concrete part: then it can be proved that the distance of the line A B from the line H H is always equal to $\frac{d}{2}$, when the line H H is placed at the centre of the imbedded steel plate or bar. Make t equal to the thickness of the metal, and put d_2 equal to the vertical distance between the two parallel lines A B and H H. The statement to be proved is that—

$$d_2 = \frac{d}{2} \quad \ldots\ldots\ldots\ldots \quad (1)$$

But we have also—

$$d_2 = \left(\frac{d_1}{2} + \frac{t}{2}\right) \quad \ldots\ldots\ldots\ldots \quad (2)$$

Consequently, from equation (1)—

$$\left(\frac{d_1}{2} + \frac{t}{2}\right) = \frac{d}{2} \quad \ldots\ldots\ldots\ldots \quad (3)$$

from which, by reducing, we obtain—

$$d_1 + t = d \quad \ldots\ldots\ldots\ldots \quad (4)$$

But from the nature of the question—

$$d_1 = (d - t) \quad \ldots\ldots\ldots\ldots \quad (5)$$

so that we finally find—

$$(d - t) + t = d \quad \ldots\ldots\ldots\ldots \quad (6)$$

from which the identity of the two sides of the equation or $d = d$ becomes apparent. As a practical example, let d = 12in. and t = 1½in. The value of d_2 should be equal to $\frac{d}{2}$, = 6 inches.

From equation (2) and (4), substituting the numerical values of d_1 and t, the equation becomes—

$$d_2 = \left(\frac{10{\cdot}5 + 1{\cdot}5}{2}\right) = \frac{12}{2} = 6\text{in.}$$

If the same method of calculation be pursued in the case represented in Fig. 3, in which the steel plate, shown by the black line, is fixed outside the lower part of the concrete portion of the rib, it will be always found that the expression for the value of D_2 will be—

$$D_2 > \frac{D}{2}$$

A comparison of the breaking weights, which, it will be remembered, were distributed over one-half of the span, or over the half-arch, gave the result set forth in Table II. The breaking weights were the weights reduced to the unit of area—that is, the weight in pounds per square foot. In the table, the breaking weight of the brick arch, which was the weakest of the whole five, is taken equal to unity. The

Table II.

Description of Arch.	Breaking Weight.	Cause of Failure.
Brickwork ...	1·0000	Cracks in the joints
Stonework ...	1·0963	Cracks in the joints
Concrete	1·2359	Cracks at dangerous sections
Concrete and steel	2·1594	Cracks on loaded and unloaded half-span
Iron	2·7641	Buckling of plates at haunching

superior strength of the compound system is again manifest as compared with the other three types of the simple principle. Although the arch is included in this table, the remarks previously applied to it hold good.* It may be stated that, generally speaking, all the arches failed at or near the points dictated by theory. Obviously in building bridges belonging to any one of the four classes specified, the structure must have a minimum width at the crown which must be maintained constant to each springing, though it is preferable, especially when the span is comparatively large, to increase this dimension towards the points of supports. The percentage of increase may vary between 0·05 and 0·075 of the central width. We have given in Table III. a list of the minimum widths which experiments have demonstrated to be most suitable for the spans correspondingly annexed. It will be observed that the ratio of the depth to the width follows very nearly a constant proportion, the average proportion being $\frac{1}{12}$. We may deduce, therefore, as a general rule, that the minimum width for bridges of the classes under notice should not be less than $\frac{1}{18}$ of the span. In spite of the marked superiority of the compound system of constructing arches in concrete, as

Table III.

Span in feet.	Width in feet.	Ratio between depth and width.
100	7·92	1/12
130	9·94	1/13
220	14·85	1/11
330	22 16	1/15
400	28·38	1/14

shown by the actual practical tests carried out, the engineers in charge of the experiments did not report in favour of it. They appear not to have been quite satisfied exactly how the separate materials in the compound type performed the respectively different duties assigned them; and this is a weak point, as must be admitted, in all combinations of a similar nature. Briefly, the conclusions arrived at were: (1) that for arches under 130ft. in span rough stonework would answer well, and (2) that for arches of spans above that dimension, either ashlar masonry or concrete might be advantageously employed. Be that as it may, we have placed before our readers all the information there is on the subject, and they are perfectly competent to judge for themselves.

T. C.

* Apropos to our subject, though not exactly in a constructive sense, few people are probably aware that the compound principle has been adopted by dentists in the manufacture of artificial teeth, but so it is. A very finely close-meshed network of aluminium is interwoven with the vulcanite "plate" at its surface, very much after the pattern of the "expanded metal" process. The application is decidedly ingenious and a little curious as well.

WARDLEY HALL, LANCASHIRE.

[WITH PHOTOLITHOGRAPHIC ILLUSTRATIONS.]

THIS most interesting old Hall, which has recently been very carefully restored, was originally part of the inheritance of the Worsleys of Worsley. The Wardley estate passed to Thurstan Tildesley (a member of the family who were Lords of Tyldesley) by marriage with Margaret, daughter and heiress of Jordan Worsley, in the beginning of the 15th century, from the Tildesleys to the Sheringtons, from them to the Downes, who were probably a branch of the Cheshire family of that name, and who seem to have acquired the Wardley estates by purchase. Roger, the first of the Wardley Downes, died about 1638, and was succeeded by his son John, who married a daughter of Sir Cecil de Trafford, from whom he probably obtained the Barton portion of the property. By her he had two children, Roger and Penelope. Roger died without issue in the year 1675, leaving his sister sole heiress to his property. Miss Downes married Richard, third Earl Rivers, of Rock Savage, Cheshire. Their only daughter and heiress, Elizabeth, married the Earl of Barrymore. Lady Barrymore's only child and heiress, Penelope, married the Hon. James Cholmondeley, second son of the Earl of Cholmondeley. By arrangement with her husband (from whom she was divorced *à mensa et thoro*) she obtained power to dispose of the Lancashire estates, which belonged to her maternal grandfather, Earl Rivers. She sold the estates in 1760 to Francis, third and last Duke of Bridgewater, to the trustees of whose will they now belong. A peculiar interest has long been attached to the house on account of a human skull being kept there, as regards which there are several traditions. It seems, however, that the true story is shortly as follows. The skull is that of a Benedictine monk, Dom Edward Ambrose Barlow, called Father Ambrose, fourth son of Sir Alexander Barlow, Kt., of Barlow Hall, near Manchester. He was born there in 1585. In or about 1617 he was sent from the English monastery at Douay to labour in his native country. He devoted his services almost exclusively to the southern parts of Lancashire, ministering chiefly in the secret chapels at the halls at Wardley, Worsley, and Morleys, the latter being the seat of the Tyldesleys. On Easter Sunday, April 25, 1641, he was preaching to his congregation in the domestic chapel at Morleys Hall, when the house was besieged by "a neighbouring minister" at the head of a fanatical mob. The priest was arrested and carried before a neighbouring Justice of the Peace named Risley; by him he was sent under an escort of 60 armed men to Lancaster, and at the next assizes was tried and condemned to death. On September 10 the martyr was drawn on a hurdle to the place of execution at Lancaster, and there hanged, cut down, butchered, and his quarters parboiled in the tar cauldron, as customary in such cases, in the fifty-fifth year of his age, and the twenty-fourth of his priesthood. His head, having been impaled either on the castle at Lancaster, or on the old church in Manchester, as was frequently done, was secretly secured by Mr. Francis Downes, and reverently preserved in his mansion at Wardley. There it remains to this day, an object of wonder, and a speaking illustration of times now happily changed. It is about twenty years since Wardley Hall was last occupied, excepting only the portion now used as stables, which had been made into three cottages, and they were usually occupied by colliers, who worked at the great Bridgewater Colliery close by. During that period it has only been so far repaired from time to time as to be kept weather-proof, and it has suffered some damage on account of the coal-workings beneath it. In 1894 it was decided to restore the house, with a view to it being used by one of the principal officials of the Bridgewater trustees, and, thanks to the interest taken in the matter by the Earl of Ellesmere, the proprietor of Worsley, no pains have been spared to carry out the restoration in as perfect a manner as possible. Messrs. Douglas and Fordham, architects, of Chester, were engaged to design the details of the work, and though it was necessary to rebuild some portion entirely, there is no appearance of newness about the place anywhere, and the architects deserve much credit for the skilful and artistic manner in which they have dealt with a difficult problem. The work itself was done by the Bridgewater Trustees' own workmen, under the direction of their engineer,

WARDLEY HALL, LANCASHIRE.

Mr. Frederick E. Caires, who is now the occupant of the house. It proved to be quite impossible to discover what had been precisely the original form and arrangements of the house, but one thing is quite certain—viz., that the suppositions in this respect of those persons, who before the restoration ventured their opinions, and in some cases published them, are all, more or less, erroneous. When the work was commenced the only two living rooms were those which are now designated the drawing-room and dining-room. The principal entrance, such as it was—in fact, the only entrance to the main part of the house—was the main staircase and the kitchen. The present lower hall was a washhouse, the smoking-room a place for firewood and sundry rubbish, and its upper part a dovecote; the cloak-room was a coal-hole. There was no kitchen entrance or back stairs. On the upper floor there was no semblance of the large upper hall, the space being occupied with several very dark and ill-arranged rooms. The house has suffered severely from the excruciatingly bad taste and Vandalism of a period now fortunately past, and has been mutilated in the most wanton manner. When the work of restoration was commenced, it soon became apparent that there was much more interest in the house than was at first supposed. In all cases where there were beautifully panelled ceilings formed of massive and richly-moulded oak beams, the most prominent members of the mouldings had been roughly chopped off—apparently with an adze, and on to them, or below them, had been nailed laths, and the whole were hidden by plastered ceilings. Where the larger beams projected, all of them being oak, they had been hacked over and covered with plaster, their sections being converted into plain rectangles with chamfered edges; and, to add insult to injury, these improved (!) beams had been painted and grained in imitation of oak. The fine old staircase had been similarly treated, and so numerous were the coats of yellow paint that it took many days of arduous labour to remove it. When it was discovered that the ceiling of the upper hall extended so far as it does, it was decided not to divide the space, as was at first intended, but to leave the whole open, as it evidently had been originally. The fireplaces here and in the hall below were discoveries, being quite invisible when the work commenced. The wide stone arches had been built up, and ordinary cast-iron "register" grates inserted. In the upper hall the old arch is reinstated after having been repaired, the same stones being used; but in the lower hall the stones had been so much damaged that a new arch was necessary. In the dining-room, too, there is an old stone arch: but it is entirely past restoration. In the room over the pantry there was found some old oak panelling lathed and plastered over, and above this, above the ceiling, some ornamental plaster-work. This panelling has been repaired and placed at the end of the upper hall, and it is proposed to attempt to restore the plaster-work and place it again above the panelling. A good deal had to be done in order to make the house dry and healthy. Water was lying a few inches below the floor level, and consequently the whole site had to be carefully drained, the walls underpinned, and a damp course inserted, and a bed of concrete was laid under all the floors. In the lower hall and entrance lobby the floor is laid with oak blocks, mostly made of bits of old timber, which had to be replaced in the course of the work. The roof was found to be remarkably sound, scarcely needing any repair. Visitors to Wardley will probably miss some of the black and white work with which they were so familiar; but as all that on the north front was sham, being painted plaster, and not timber work at all, it was thought best not to replace it, but to restore the old brick walls which it covered. New windows were required throughout the whole house, those in the brick walls being made of red Runcorn stone, and those in the half-timbered portion, of oak, and the whole are fitted with wrought-iron casements made by Messrs. Wragge, of Manchester, the lead work being simple and very pretty. The firegrates are, with very few exceptions, of the front hob or economiser patterns. The restoration, though a costly matter, has resulted in the saving from ruin of one of the most interesting old houses in Lancashire, and, moreover, in making it as quaint and comfortable a home as could be wished for. The skull, which during the progress of the work was placed in an iron safe, is now reinstated in a niche in the wall of the staircase, where for many years past it has lain carefully protected with glazed doors.

Plans are being prepared by Messrs. Austin and Paley, of Lancaster, for a new church in the parish of St. Anne, Hindsford, near Atherton, and the ceremony of laying the foundation-stone will shortly take place. The estimated cost of the building is about £6,000, and there is in hand over £3,700.

Through the munificence of Mr. Thomas Sutton Timmis, of Allerton, Liverpool, the tower and nave of Acton Church, Nantwich, has just been completely restored. Mr. Timmis's mother many years ago resided at Acton, and the work of restoration was undertaken by Mr. Timmis in commemoration of her memory at a cost of nearly £5,000. The chancel of the church is being restored by Lord Tollemache, and Mr. H. J. Tollemache, M.P., has undertaken to erect an organ loft at a cost of £600.

OBITUARY.

Mr. William C. T. Dobson, an honorary retired Academician, of Petworth, died at Ventnor on Saturday in his 81st year. He was born in 1817 at Hamburg, where his father was an English merchant. He began to study from the antique at the British Museum when 11 years old, and became a student of the Academy at the age of 19. In 1843 he was appointed head master of the Government School of Design at Birmingham, but relinquishing that post two years later, he travelled in Italy and Germany. Mr. Dobson was elected an Associate of the Royal Academy in 1860, and an Academician in 1872, when he painted "St. Paul at Philippi" as his diploma picture. In 1875 he was elected a member of the Royal Society of Painters in Water-Colours. Among Mr. Dobson's principal pictures are "The Alms Deeds of Dorcas," painted in 1855 by command of the Queen; the "Child Jesus going to Nazareth," 1857, which, with another early work, is in the possession of the Baroness Burdett-Coutts. These were followed by a number of groups of children, of religious pictures, and other *genre* works, some of which were executed in oils and others in water-colours. Many of his works, which were delicate in execution and sentimental in character, have been engraved. His last exhibited works were portraits shown at Burlington House in 1894.

By the death of Mr. James O'Byrne, architect, Liverpool, the Roman Catholic Church of the Liverpool diocese has benefited to a considerable extent. The testator's unique collection of books, coins, arms, pictures, mezzotints, engravings, photographs, curiosities, and art furniture is bequeathed to the Roman Catholic Bishop of the Diocese of Liverpool (Dr. Whiteside), so that it may form a nucleus for a museum at the Roman Catholic seminary of St. Joseph, at Walthew Park, near Upholland, in the county of Lancaster. The total value of the collection is said to be about £20,000. The residue of his estate Mr. O'Bryne has left to Bishop Whiteside absolutely. The personal estate, inclusive of the historical collection, is expected to amount to something like £105,000; and the residue, with the freehold property will, it is believed, be between £40,000 and £50,000. Although the last-named amount is left to the Roman Catholic bishop absolutely, it is understood that it will be devoted to the advancement of the church of which he is the head in the diocese.

CHIPS.

The bells in the parish church of Chediston, Suffolk, have been reframed, refitted, and rehung, and another has been added to the peal. The work has been done by Messrs. Day and Son, of Eye. The Bishop of Norwich dedicated the peal on Wednesday in last week.

At the annual meeting of the Royal Cambrian Academy of Arts, on Saturday, a letter was read from Sir. E. J. Poynter, P.R.A., consenting to become a hon. member of the Cambrian Academy. It was resolved to throw the Cambrian Exhibition this summer open to all artists in the United Kingdom. Mr. C. Boydell and Mr. H. Hughes were elected full members, and Mr. E. Bottomley, Mr. T. Clough, Mr. R. E. Morrison, Mr. G. H. Swinstead, and Mr. Brint Turner were elected associates.

Colonel A. G. Durnford, R.E., an inspector from the Local Government Board, held an inquiry at the Reading-room, Bishopstoke, on Friday, with reference to the application by the Winchester Rural District Council to borrow £5,000 for the purpose of carrying out a system of drainage for Bishopstoke, from plans by Mr. Berringtoo.

The annual dinner of the Leeds Builders' Exchange Club was held on Friday evening in the Grand Restaurant, Leeds. Mr. W. Lolley presided, and over 100 sat down. After dinner a short toast-list and musical programme was gone through.

The corporation of Southampton have raised the salary of Mr. W. Matthews, who has been the waterworks engineer since 1884, from £110 to £450 per annum.

At the Manchester Consistory Court on Friday, a faculty was granted for rebuilding St. Peter's Church, Oldham, and also to the vicar of Holy Trinity, Coldhurst, Oldham, to remove all plain glass windows and replace them with stained glass, six being memorial windows, to replace the present font with one of alabaster, to take down the gallery at the west end, to convert the north and south doors into windows, to open a new doorway at the west end, to build a porch at the west end, and to place a brass tablet in the chancel.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Bristol Master Builders' Association.—The annual meeting of this association was held on Monday at the Guildhall, under the presidency of Mr. August Krauss. There were also present Messrs. G. Humphreys (treasurer), F. N. Cowlin, J. E. Jones, G. Downs, E. F. Woodward, J. James, E. Walters, C. Cowlin, C. A. Hayes, W. Podger, A. S. Scull, and H. J. Spear (secretary). The president moved the adoption of the report and accounts, and said that they were pleased to know the building trade was good in Bristol last year, and, what was still better, they had no disputes with their men. They had formed that year their West of England and South Wales Federation, which consisted of builders in Bath, Bridgwater, Cardiff, Newport, Taunton, Plymouth, and Weston-super-Mare. The federation had been formed for the purpose of doing justice to their men and themselves. The federation had taken steps as regards the Employers' Liability Act, and approached the architects to have a clause inserted in quantities similar to a fire insurance clause, so as to relieve the builders of heavy responsibility, and other federations had also taken that step, which would certainly be favourably considered by the architects. The Bristol Channel Timber Importers' Association had reduced their terms for credit, and the builders were fully justified in asking that the percentage of retention money should be reduced on contracts. Mr. Downs seconded the resolution, and dwelt upon the importance of enrolling new members. He was pleased to observe from the treasurer's account that the membership had been augmented considerably during the past year. The resolution having been adopted, the president announced their vice-president, Mr. William Church, was unable to accept the office of president in consequence of indisposition. Mr. G. Wilkins moved a resolution expressing their appreciation of the long and valued services of Mr. Church. Mr. C. A. Hayes seconded the resolution, which was carried by acclamation. Mr. Walters proposed, Mr. J. E. Jones seconded, and it was carried by acclamation, that Mr. August Krauss be re-elected president for the ensuing year. Mr. F. N. Cowlin was elected as vice-president, and Mr. A. S. Scull moved, and Mr. Podger seconded, that Mr. George Humphreys be re-elected treasurer for the current year. Messrs. Hayes, Downs, Wilkins, Scull, and Eastabrook were added to the committee. The annual dinner of Association was afterwards held at the Royal Hotel, under the presidency of Mr. A. Krauss.

Glasgow Architectural Association.—At the usual monthly meeting—the president, Mr. W. T. Conner, in the chair—Mr. Wm. Brooks Sayers, member of the Institute of Electrical Engineers, delivered a lecture entitled "Electric Light, Heat, and Power—their efficient Installation and Cost." The lecturer opened his subject by drawing a picture of what electricity could do to lighten the burden of existence. With electric light, heat, and power, we would have no smoke, filth, or suffocating fogs, thus leaving everything fresh and clean without and within; we could pave our streets with asphalte, over which the rubber-tired motor vehicles would skim noiselessly. A descent, however, to the practical showed that much progress had yet to be made, which Mr. Sayers demonstrated by tables and figures, comparing the cost of electricity, gas, and water, supplemented by a description of the different systems and apparatus for electric lighting, illustrated by examples. At the close, a hearty vote of thanks was accorded the lecturer.

Leeds and Yorkshire Architectural Society.—A dinner in commemoration of the 21st anniversary of the founding of this Society was held at the Queen's Hotel, Leeds, on Monday evening. Mr. George Carson, president, was in the chair, and amongst those present were the Lord Mayor of Leeds (Alderman Tetley), Mr. W. S. Braithwaite (vice-president), Mr. W. M. Fawcett (vice-president of the Royal Institute of British Architects), Mr. W. B. Woodhead (president of the Bradford Society of Architects), Mr. E. Matheson (president of the Leeds Chamber of Commerce), Mr. A. T. Walker (president of the Association of Yorkshire Students, Institution of Civil Engineers), Dr. Bodington (Principal of the Yorkshire College), Alderman Gordon, Mr. T. Riach, Mr. H. J. Palmer, the Rev. Canon Wood, Mr. John Ely (president of the Manchester Society of Architects), Mr. G. Benson (president of the York Architectural Society), Dr. Scattergood (Dean of the Medical Department of the Yorkshire College), Mr. E. W. Batley (chairman of the Building Clauses Committee of the Leeds Corporation), Mr. H. Perkin, Mr. G. Atkinson, Mr. H. S. Chorley, Mr. J. N. Barran, Mr. Sydney Kitson, Mr. J. E. Bedford, Mr. J. H. Wicksteed, Mr. L. Cooper, Mr. R. Wilson, Mr. A. Smithells, Mr. W. H. Thorp, Mr. W. E. Barry, Mr. A. E. Kirk, Mr. H. Thompson, Mr. W. Carby Hall, Mr. G. F. Bowman, Mr. G. B. Bulmer, Mr. T. B. Wilson, Mr. E. T. Dodgshun, and Mr. F. W. Bedford (hon. secretary). After the loyal toasts had been honoured, "The Lord Mayor and City Council" was proposed by Mr. W. H. Thorp. The Lord Mayor in responding, said that there was plenty of work for the city council to look forward to. Not many of the streets in the city were straight, and most of them ended at a short distance in a row of houses. One of the things upon which the council would be most congratulated, if they accomplished it, was the making of streets direct from the centre to the outskirts of the city. There were means of communication in some directions; but the city sorely required cross streets. He drew a comparison between the cities of Buda-Pesth and Berlin. He held that the system of small, low, back-to-back houses was not in every way to be condemned, and had a great advantage over tenement houses in crowded cities, inadequately supplied with light and air. Much as they might despise and wish to do away with back-to-back houses, there was something to be said for them. Leeds must look to the architects to assist not only in arranging the streets, but, if possible, in raising the standard of beauty and proportion to something like that of Paris. The first thing to be done was to make the streets sufficiently wide, and insist that the houses put up should be of a certain height. If the architects of Leeds could induce the building clauses committee of the city council to form a scheme which would secure that buildings of one kind were erected in one street, and buildings of another kind in another street, Leeds in the future might be admired not only for its commercial enterprise, but also for its beauty. Mr. E. Wilson gave "The Royal Institution of British Architects and Allied Societies." Mr. W. M. Fawcett and Mr. John Ely responded. "The President and the Leeds and Yorkshire Architectural Society" was given by Ald. Gordon. The Chairman responded. Mr. H. Perkin proposed "Art, Science, and Literature." The toast was responded to by Mr. M. C. W. Flower. Mr. A. T. Walker and Dr. Bodington also responded.

A builder of Lansdowne-road, East Ham, named John Jolly, aged 46, was taken to the local police-station on the evening of January 24, charged with being drunk. The next morning he met two of the constables who had been concerned in arresting him, and fired at one, whom he wounded seriously behind the right ear. An attempt to discharge his revolver a second time was frustrated. Jolly was taken before the magistrate at West Ham on Wednesday, when it was stated that the injured constable, named Hill, was still in the hospital. Jolly was remanded.

The Senatus Academicus of Edinburgh University have passed a unanimous resolution expressing in appreciative terms their sense of the value to the University of the services rendered by Dr. Rowand Anderson during a long period of years as architect of the University New Buildings, now completed by the M'Ewan Hall. They state that: "While considerations of convenience have not been sacrificed to appearance, the planning of the interior arrangements has resulted in that effective external grouping which has made the New Medical School, as a whole, an acknowledged adornment to a city famous for its architectural monuments." They add that, "the Senatus Academicus recognise that the merits of the design of the Hall entitle the architect to the lasting gratitude of the University."

At the half-yearly meeting of the Central London Railway Company, held on Wednesday, the engineers reported that good progress had been made by the Electric Traction Company with the works during the past six months, no serious hindrance to the operations having occurred. Three-fourths of the main-line tunnel had been completed, as well as one-half of the station tunnels, and nearly the whole of the lift and staircase shafts had been constructed. A very difficult work had to be undertaken—namely, the diversion of the sewers, and gas and water and other pipes, underneath the pavement at the Bank station, which was proceeding satisfactorily. Part of it was practically complete, and the public subways were well advanced. The total expenditure so far has been £1,600,000.

WARDLEY HALL, LANCASHIRE.

FOR description and floor plan, see page 158.

QUEEN'S THEATRE, LEEDS.

THIS new theatre at Leeds is being erected for Messrs. Morell and Mouillot and Messrs. Dotridge and Longden. The builder is Mr. S. F. Davidson, of Newcastle-on-Tyne. The building now in course of erection is situate at the corner of Meadow-road and Jack-lane, and will be faced with red bricks and stone dressings. The accompanying plan shows the arrangement of the building. The dimensions are as follows:—From curtain to back wall of pit, 72ft.; width of auditorium, 78ft.; stage, from curtain to back wall of stage, 41ft.; four exits are provided from the pit; three from the gallery, and two from the dress circle. The plan has been arranged so that one pay-office serves for the whole of the house, and the theatre will hold about 4,000. The contrivance of the frontage, so as to provide for shops, is very ingeniously managed. Messrs. W. Hope and J. C. Maxwell, of Newcastle-on-Tyne, are the architects.

CHURCH OF OUR LADY, HALBERSTADT.

THE exterior photographic view, which we are enabled to give to-day of this interesting and very ancient North German church, shows the fine western towers as seen from the adjoining gardens looking from the south east. They are thoroughly typical, and have almost a Rhinish look in their general grouping and outline. There is an extremely rich screen filled with sculpture on the north and south sides of the choir. The church itself was long disused as a place of worship during the early half of this century; it dates from 1005 A.D., and is of a Byzantine character with a vaulted chancel. It has been restored throughout, and decorated in the choir, which is separated from the nave by an iron fence.

CHURCH OF ST. PETER AND ST. PAUL, KÖNIGSLUTTER.

THE interior of the Benedictine church at Königslutter has lately been very elaborately decorated, and the view herewith published shows how the ancient sanctuary has been renovated and painted throughout. The fabric is of about the same period as its neighbour above mentioned. The church contains monuments of the Emperor Lothario and his Empress and of Henry the Proud—all ancestors of the family of Brunswick. There is a fine cloister attached to the precincts. We are indebted for these illustrations to Herr von Wasmuth's excellent folio of photographs "Der Mittelalterlichen Baukunst in Deutschland," a work of value and interest sent us for review, and now in course of publication.

NATIONAL GOLD MEDAL DESIGN FOR A STENCILLED FRIEZE AND FILLING.

THIS design, herewith reproduced, is by Mr. Geoffrey Alan Baker, of Canterbury School of Art, and in the words of the official report of the judges who awarded the medals and prizes it is described as "an extremely clever and workmanlike design, which goes rather beyond what is generally advisable to attempt in stencilling; but the designer is so successful that the examiners gladly recognise the merits of his work by the award of a Gold Medal." The judges were Messrs. Lewis F. Day, Walter Crane, and Maurice B. Adams. The suggestion in the band closing off the foreground, so to speak, of the frieze proper, of rabbits in the grass, is nicely managed. There is enough delineation about them to imply more than is actually drawn, and the effect is satisfactory without the common fault of hardness. This monochrome reproduction has not the advantage of colour which constitutes so marked a feature in the original, but it gives a capital idea of the design.

STAIRCASE IN VILLA, BERLIN.

WE give, amongst our block illustrations this week, some useful details of a staircase in a Berlin residence, including a portion on the rake, with a newel surmounted by a carved eagle, and moulded and shaped circular ends to steps, also alternative newel; whilst a detail of arcade and balustrade to larger scale, with small plan, are likewise shown on the same sheet. Herr Hans Grisebach is the architect of the work.

OLD ENGLISH CLOTHES CHESTS, AND OTHER FURNITURE.

THIS sheet of sketches shows some very interesting types of furniture. The Chest of Drawers, of the William and Mary period, consists of four long drawers, each being subdivided into two panels, with a drop-handle to each. A point worthy of observation is the treatment of these panelled drawers, the panels being unshaped plain oblongs in top and third drawers, but having mitred breakings in the alternate ones. The beadings between drawers and to end stiles add to the appearance. The Dwarf Chest is of earlier date, and has lift-up top, while below is one long drawer. The half-balusters planted on, the plain arcading, and central group of panels, are ingeniously contrived, and combine to excite interest. The turned Chair is an admirable example of such work, executed with restraint, and looking thoroughly serviceable; the seat is of rushwork. The little Oak Table with the sloping legs could not easily be improved upon for "occasional" uses.

Mr. G. T. Clark, F.S.A., died on Monday night, at the age of 88 years, at his residence, Talgarn, Glamorganshire. He was a well-known antiquarian and author; an authority on earthworks and castellated structures, and also on the Roman occupation of Glamorganshire, and had for many years been manager and resident trustee of the Great Dowlais Works.

Of the 52 candidates from various parts of the country who applied for the post of city engineer to the Corporation of Liverpool, the special committee having the matter in hand selected on Monday 13 to appear before them. This committee, which will meet again on Thursday in next week, were deputed to select ten gentlemen, and when the list has been reduced to that number those applicants will be invited to go before the members of the Health Committee, who will have to make the final selection of one name for recommendation to the city council.

The half-yearly report of the directors of the London and South-Western Railway Company states that the plans for the works of the Meon Valley Railway (Alton to Fareham) are in the course of preparation and tenders for the construction of the line will now be invited. The Holsworthy and Bude Railway is approaching completion, and will be ready for traffic in July next. The order of the Light Railway Commissioners for the Basingstroke and Alton Light Railway has been confirmed by the Board of Trade, and the construction of this new line will be commenced without delay. Further widenings of the line from Nine Elms to Clapham Junction and from Woking to Basingstoke are making good progress, and the additional lines of rail between Basingstoke and Woking Junction have been brought into use.

COMPETITIONS.

WESTON-SUPER-MARE.—In a limited competition for a new Wesleyan Chapel to be built at Weston-super-Mare, the design of Mr. W. J. Morley, F.R.I.B.A., of Bradford, was accepted. The building is designed in the Decorated Gothic style, with tower and spire, and will cost about £5,000.

CHIPS.

The Brynsiencyn Board Schools, North Wales, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. Shorland and Brother, of Manchester.

The Local Government Board has approved of the plans of the Milton Valley water scheme for the supply of Pembroke Dock and the Government Dockyard, and authorising the council to borrow £23,000 for the purpose of carrying out the works in connection with the same.

Mr. Walter A. Ducat, one of the inspectors of the Local Government Board, conducted an inquiry at the Town Hall, Bolton, on Friday, respecting an application by the town council to the Local Government Board for sanction to borrow sums of £10,255 for refuse disposal and £3,000 for technical instruction.

The new free library for Hoxton will be opened by Sir John Lubbock on March 25. It has cost £20,000, faces Pitfield-street, and has been erected from plans by Mr. H. T. Hare, selected in competition. Messrs. Dearing and Son are the builders.

The vacancy in the office of burgh surveyor in St. Andrew's caused by the appointment of Mr. Lumsden to the surveyorship of Edinburgh Suburban District, was filled up on Monday, by the election of Mr. Drummond, Master of Works, Springfield.

The Watch Committee of the Halifax Corporation have passed a resolution to be submitted to the council recommending the adoption of the plans submitted for a police-station and court-house. The various tenders amount to £13,060 8s. 6d, including £561 16s. for certain additional alterations, the total cost of the building, after deducting the sum of £326 5s. for old materials, being £12,734 3s. 6d.

The proposal to restore Brechin Cathedral at an estimated cost of £10,000 is reported to be meeting with liberal support. The committee state that already about half the required sum has been subscribed.

The widening of Davies-street at its juncture with Oxford-street, an improvement resulting from the erection of a station for the Central London Railway at that point, has just been commenced, and the existing houses are in course of demolition.

The gas committee of the corporation of Birmingham are proposing a very large scheme of capital expenditure. They contemplate the outlay of £336,000, to be spread over five years, for the reconstruction of existing works and the provision of additional works, capable, when the alterations and extensions are finished, of providing an extra supply of 10,000,000 cubic feet of gas per day. The proposals were, after some discussion, adopted by the Birmingham Corporation on Tuesday.

The Stoke-on-Trent Board of Guardians considered at their last meeting plans prepared by Mr. Charles Lynam, F.R.I.B.A., of that town, for building a new administrative block for the workhouse on the site now occupied by the infirmary, and the utilisation of the schools and site for new wards for men. There was a general expression of opinion against interfering with the schools, and ultimately Mr. Lynam was instructed to prepare a general scheme providing such accommodation as would relieve the present overcrowding and meet the requirements of the union for the next ten years, on the land at the rear of the workhouse.

The organ in Winchester Cathedral was dedicated on Thursday in last week, after reconstruction and enlargement. The instrument was originally built by Mr. Henry Willis for the Great Exhibition of 1851, where it obtained the prize; and on the recommendation of Dr. Wesley, organist of Winchester Cathedral at that time, it was bought by the Dean and Chapter in 1852. Their purchase, however, did not include the whole of the organ as it stood, and consequently there has hitherto been a want of balance in the parts. Meanwhile the daily use for forty-five years brought about a large amount of wear and tear. In 1896 Dean Stephens consulted Mr. Willis with a view to having the organ repaired, remodelled, and brought up to date. Mr. Willis, in consideration of the special interest which he felt in the organ, offered to undertake the work for the very moderate sum of £1,000. The offer was accepted, and the work has now been completed. The instrument now consists of four complete manuals from C C to G, 56 notes and 2½ octaves of concave and radiating pedals, from C C C to F, 30 notes.

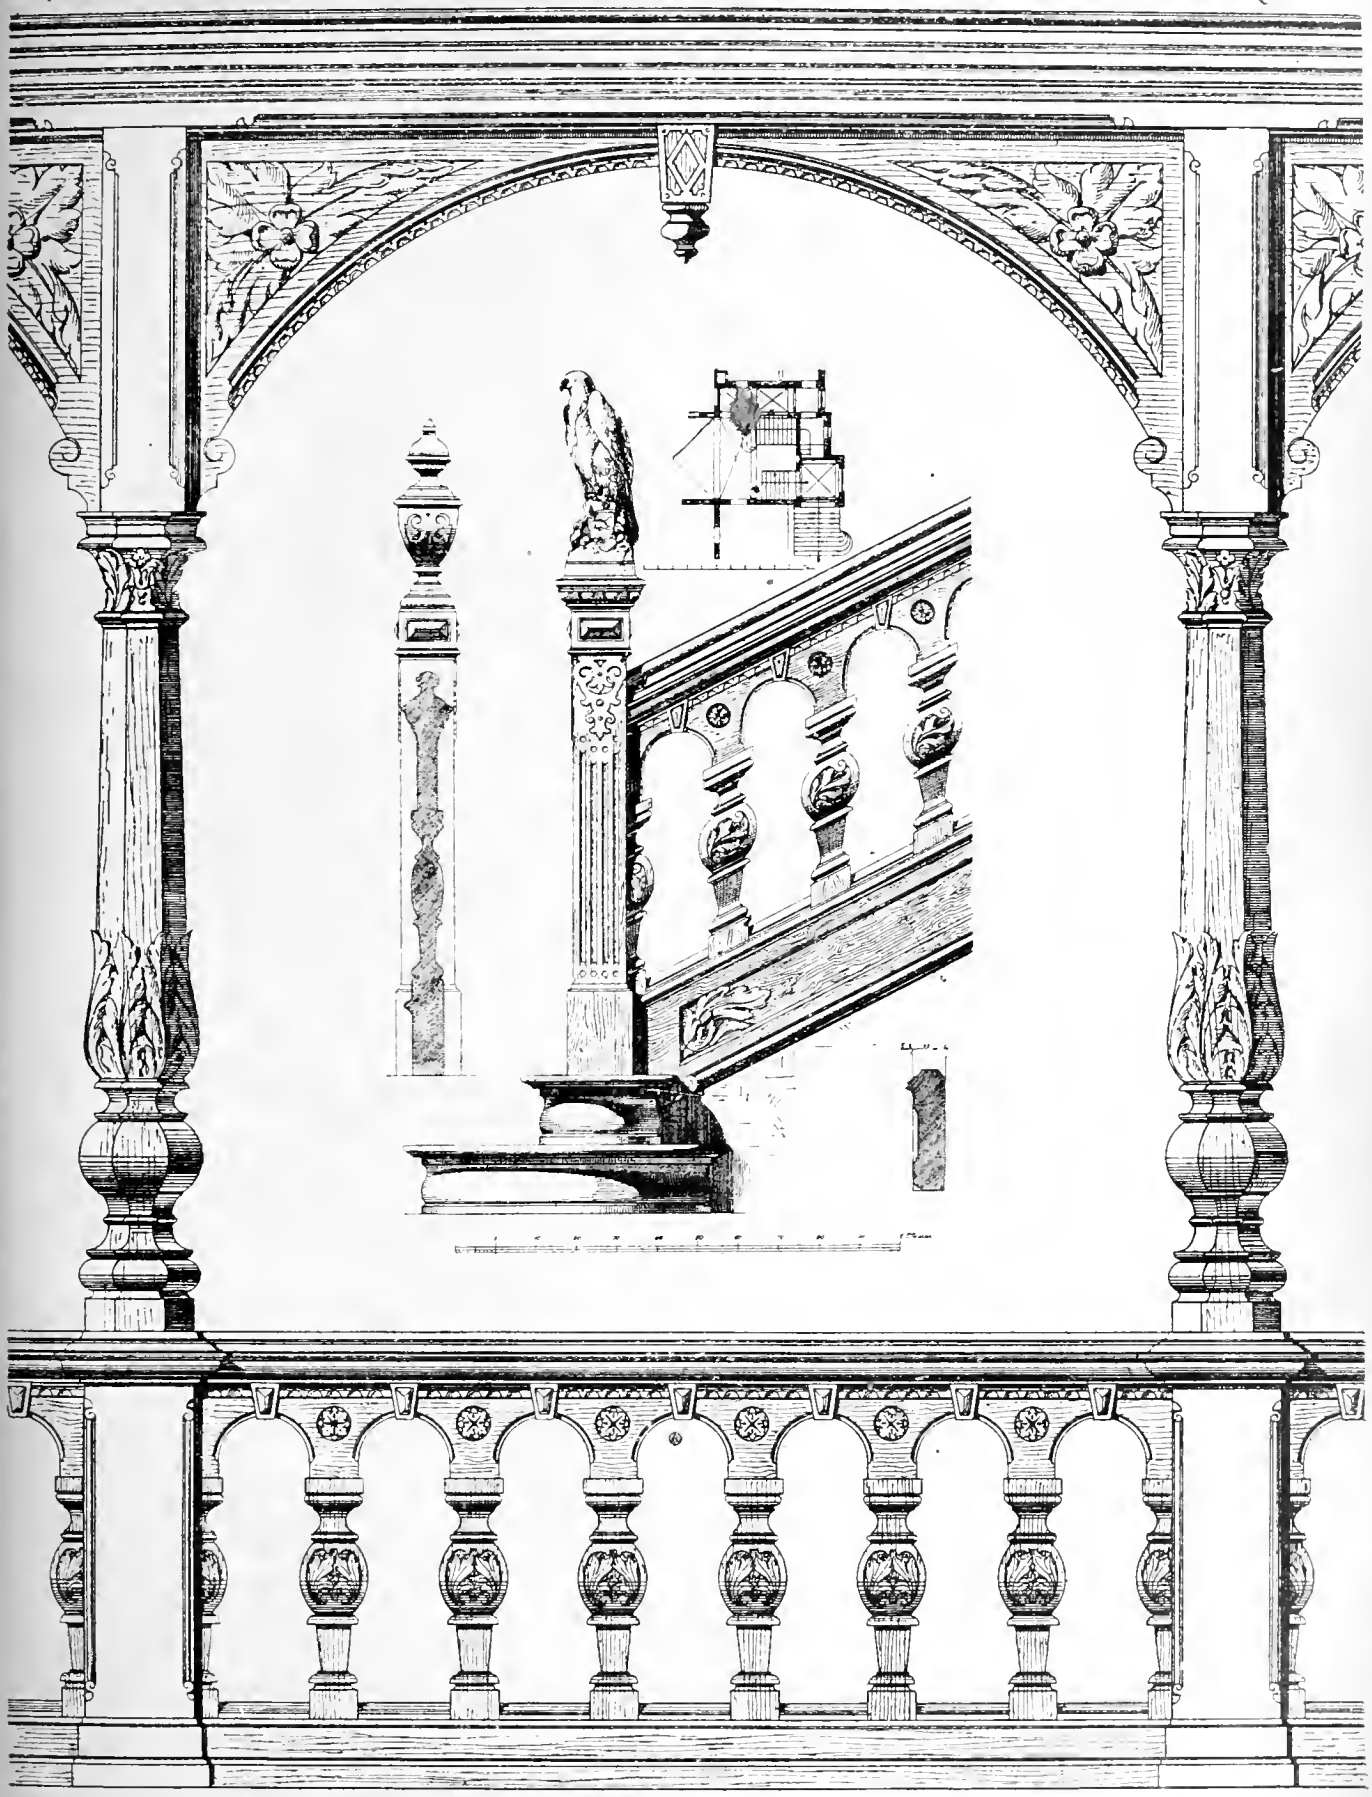
NATIONAL GOLD-MEDAL DESIGN FOR STENCILLED FRIEZE & FILLING BY GEOFFREY ALAN BAKER



STAIRCASE IN VILLA, BERLIN.

Building Intelligence.

Barry.—The opening services of the new Wesleyan Chapel, which has been erected on the brow of the hill overlooking Barry, were commenced last week. The structure has been built at a cost of about £3,400 by Messrs. E. R. Evans Bros., of Cardiff, from plans prepared by Mr. Budgeon, of the firm of Jones, Richards, and Budgeon, architects, Cardiff. The elevations are of Newbridge stone, with Bath stone dressings, the style adopted being Early Perpendicular. The ornamentation, however, is almost limited to the treatment of the central part of the front elevation. The width of the chapel at the transepts is greater than the length of the building from lobby to choir. Sitting accommodation is provided for 624 persons upon the ground floor, and when the galleries are erected the accommodation will be increased to about 1,100. The choir seats are behind the rostrum, and will accommodate 46, with space for organ in addition. There are two vestries for the choir and minister, both rooms having access to a large parlour. There are no gallery supports and columns from the same to help to carry the roof, which is in one span, light Bath stone pilasters carrying the ends of roof trusses. A feature in the chapel is that Jarrahdale Jarrah wood has been introduced as wood-block flooring in the passages and elsewhere.

Cleckheaton.—The new Liberal Club at Cleckheaton, in the Spen Valley Division, was opened by Sir Henry Fowler, M.P., on Friday. The club is a building of two stories, in the Renaissance style, and, exclusive of site and furniture, has cost £2,500. The site cost about £1,100. There is a ashlar stone frontage to the main elevation near Northgate, and which has mullioned and transomed windows. Above the entrance is a balcony, to which access is obtained from one of the upper rooms. To the right of the entrance is a reading-room, 28ft. by 17½ft., with a floor of wood blocks; opposite is the committee-room, 17½ft. by 15½ft. The assembly-room, on the same floor, is 36ft. by 28ft., and accommodates 180 persons. On the second floor there are two billiard-rooms, a bar, card-room, and lavatories. The building has been erected from the designs of Mr. Reuben Castle, architect, Cleckheaton.

Edinburgh. — The North British Railway Company recently resolved that the whole of the large building now rising at the corner of North Bridge-street and Princes-street should be devoted to hotel purposes. When the plans were first drawn they showed part of the building allocated as offices for the manager, secretary, superintendent, engineer, and their respective staffs. The change has been made in order that the architect, Mr. W. Beattie Hamilton, might have a free hand to arrange the interior of the building in a symmetrical fashion, and provide for more bedrooms for visitors. The Dean of Guild Court and the railway directors have now finally sanctioned the plans, and the work will now be proceeded with. The whole of the street level on the south side of the building overlooking the station will now be appropriated for ball-room accommodation. The principal ballroom will be 120ft. by 36ft.; there is another 72ft. by 30ft., and a third 42ft. by 25ft. Associated with these will be a series of cloak and retiring rooms, and service and other rooms necessary for carrying on the entertainment part of the business. On the first floor of the building, which is 185ft. square, there is a corridor on each side, which, at the angles, breaks out into a circular connecting hall. It has also been determined that the whole building shall be of fireproof construction from top to basement. Originally the plan of the hotel showed 370 bedrooms for visitors. By the arrangements now made there will be 400 bedrooms of this description, and about 150 bedrooms more for the hotel staff. There will be no alteration on the elevations. The property facing Princes-street will be pulled down after Whitsuntide, and the hotel will proceed simultaneously on all sides at once. The North British staff will by that time have taken up their quarters in the Waterloo Hotel, which will be adapted to their wants.

Ipswich.—A new hall in connection with, and adjoining the Social Settlement Buildings in Fore-street, Ipswich, was opened on Tuesday by the Dean of Norwich, Dr. Lefroy. The hall has been built at the sole cost of Mr. D. Ford Goddard, M.P., and seats 650 persons. It is 69ft. long (exclusive of a platform recess and an organ-chamber), 41ft. broad, and 30ft. high to the ridge of the roof. The latter is shaped hexagonally, and starts 17ft. from the floor. It is supported by a series of principals, made by Messrs. Cocksedge, of Stowmarket, and from the centre depend two ventilating sunlight gas-lights, fitted by Messrs. J. H. Pickup and Co., London and Bury. The platform occupies an arched recess 24ft. 6in. across by 9ft. deep, behind which is an organ-chamber, 4ft. 6in. by 11ft., containing an instrument built by Messrs. A. Hunter and Son, of Clapham, S.W. Messrs. Eade and Johns, of Ipswich, were the contractors, and Mr. E. Catchpole, of the same town, was the builder.

Manchester.—The Local Government Board have signified their approval of the specifications, plans, and sections for new streets in the Chester-street and Pott-street areas, and the plans of the labourers' dwellings to be erected on those areas. The Board have authorised the city council to carry out their new proposals in regard to the erection of dwellings on the Oldham-road area and a lodging-house for men on the Harrison-street area. In regard to a further loan required for the completion of the rehousing and reconstruction schemes, the total expenditure already incurred and the estimated cost of the works now to be carried out amount to £276,314, towards which the Board have sanctioned loans amounting to £253,375. The amount now required is therefore £22,939, and formal sanction to the borrowing of that sum is now given.

New Cross.—New public baths in New Cross-road are approaching completion. The elevation is of red brick and Portland stone, and the buildings are being erected from designs by Mr. Dinwiddy, of Greenwich, and 5, Whitehall, S.W., selected in open competition. A feature of the building is the first-class swimming-bath, with a water area of 110ft. by 35ft., surrounded by a gallery. There is a second-class swimming-bath of somewhat smaller dimensions. There are 69 private baths in four departments, divided into first and second class for men and women. A public washhouse and laundry (containing 23 separate washing cubicles), together with a smaller and separate establishment laundry, are planned at the rear. A well has been sunk to a depth of 250ft., yielding a good supply of water, the quantity being estimated at 40,000 gallons an hour. The total contract sum, including the engines, electric lighting, and well plant, is £37,492.

Sealand, Chester.—The foundation-stone of the proposed Infectious Diseases Isolation Hospital at Sealand was laid on Tuesday week by the Mayor. The site forms part of the Sealand estate purchased by the Corporation. The buildings, designed by Mr. H. Beswick, and contracted for by Mr. W. W. Freeman at £14,000, are to be constructed in wire-cut Ruabon bricks with dressings of terracotta. The foundations are to be built on Portland cement concrete footings, and all the ground under the building is to be covered with a bed of Portland cement 6in. thick. The hospital will provide beds for 48 patients, and an administrative block of sufficient size to meet a future extension to 80 patients. It is proposed to provide one isolation pavilion containing four wards of two beds each for undeveloped cases or for paying patients—8; two ward pavilions containing two wards of six beds each—24; one ward pavilion containing one ward for four acute cases and one ward for ten convalescent cases—14. All these buildings will be of one story in height. In order to obtain a south aspect to the wards, the buildings are placed diagonally and in échelon. The space allowed between the ward buildings is 40ft. The administrative block and the laundry blocks are separated from the wards by the main drive, 21ft. wide. The isolated pavilion will be divided by a wall carried through the entire width. Each pair of wards is separated by a nurses' room, with inspection windows into each ward. All doors open out on to a roofed-in verandah. A capacity of 2,000c.ft. is allowed for each patient, and a wall space of 12ft. line for each bed. The wood floors of the wards and nurses' rooms will be of pitch-pine, grooved and tongued, the walls to be plastered and finished in adamant. The administrative block will be a three-story building, with kitchen department one story in height in the rear. The building will be lighted with electricity.

Weston-super-Mare.—The building fund in connection with the proposed new church for the district of All Saints', Weston-super-Mare, has been started, the whole of the £1,310 required for the purchase of the site having been raised before the close of 1897. Mr. G. F. Bodley, A.R.A., has arranged to meet the building committee very shortly, with a view to preparing plans for a new church, the foundation-stone of which it is proposed to lay about Midsummer Day next. The new church will cost at least £6,000; but only the chancel will be proceeded with as a first instalment, and the cost of this will be about £2,000.

WATER SUPPLY AND SANITARY MATTERS.

Maidstone. — The Local Government Board inquiry into the outbreak of typhoid fever at Maidstone was opened on Monday. Mr. Percy Adams, deputy medical officer, said that the inquiries he made after the outbreak led him to believe that it arose from the Farleigh water supply; but he admitted that people had been attacked in streets which did not have water from that source. He did not think the epidemic was caused by the drainage of the town, though it probably accounted for some of the secondary cases. Mr. M. A. Adams, the medical officer, said he considered the organisation for combating with the fever was most complete. The inquiry was adjourned. On Tuesday Mr. Adams, the medical officer of health for the borough, was further examined, and asserted that the state of the drains was certainly not the cause of the outbreak. On Wednesday the evidence of Mr. Adams, medical officer of health, was concluded, and Dr. Washbourn, of Guy's Hospital, and Dr. Sims Woodhead, director of the laboratories of the Royal College of Physicians and Surgeons, were examined.

The Metropolitan Water Supply.—The Royal Commission on this subject sat again on Monday. Sir A. R. Binnie, chief engineer to the London County Council, in cross-examination by Mr. Pope, Q.C., on behalf of the water companies, said that his suggestion was that the undertakings of the water companies should be purchased by a central water authority, preferably by the London County Council; that the existing supply should be maintained as long as might be reasonable; and that any supplemental supply should be drawn, not from the Thames, but from some other source. His idea of a central authority was one upon which the London County Council should be represented to the extent of 80 per cent. The price paid to the water companies should be ascertained, failing agreement, by arbitration under a special clause of an Act to be obtained by the Council. Mr. H. E. Haward, comptroller of the London County Council, was under examination when the commission adjourned. At Tuesday's sitting of the commission, Mr. Haward was further examined. He contended that the water companies' shareholders have received premiums in addition to their dividends, and that the reduction of the water rates of some of them has been unduly postponed in consequence of the creation of unnecessary capital. He supplied statistics in support of these contentions. The witness was still under examination when the commission adjourned.

CHIPS.

Additions are being made to the Board School, Napier-street, Hoxton, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

A new tower is about to be added to St. Chad's Church, Chadwell Heath, from designs by Messrs. Chancellor and Son, Chelmsford and London. The work is to be commenced at once by Mr. Joseph Grimes, of North Gate Works, Colchester, who built the church thirteen years ago.

A memorial to the late Mr. Walter Charles Rand, of the Indian Civil Service, who was assassinated at Poona last summer, was unveiled at St. Peter's Church, Lordship-lane, on Saturday afternoon. It is situated at the west end of the church, and consists of a mural tablet of alabaster, with a brass plate bearing an inscription.

A fatal accident happened on the Great Northern Railway at Fletton, near Peterborough, on Wednesday evening. A night-shift gang of men employed at the No. 1 yard of the Peterborough Brick Company were walking up the line, on their way to work, just before six o'clock, when they saw an express approaching. They moved on to the slow road, and had only just got into the four-foot way when they were run into by a light engine engaged in shunting in the brick-yard siding. Four of the men were cut to pieces, and a fifth, Walter Fairchild, was seriously injured. The names of the killed are John Thompson, William Spring, Richard Ripney, and John Woolley. All are single men.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

"It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

ROLLERS FOR GRANOLITHIC WORK.—A subscriber wants the address of makers of above. Says he has seen an advt. of such in our pages some time, but fails to find it. If makers write to us, we will send him on name and address. We may point out that there is scarcely a week in which we are not thus asked for addresses, and wonder very much that more do not avail themselves of our "Directory," which was intended to give the help thus sought.

RECEIVED.—D. R. and G, R.—F. G.—K. J. and Co.—D. (Ipswich).—F. N P.

Correspondence.

THE CARDIFF COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—As I have failed to get a response from Mr. Waterhouse, I suppose I must now leave the matter to the judgment of the profession, and to the conscience of that gentleman. After that long struggle of three or four months (much of it by "midnight oil"), all we, as competitors, get are: broken conditions of competition; a scant quarter of an hour or so of consideration; and—silence. Surely Mr. Waterhouse's appeal to us to be "up and doing" our best (*vide* his letter to the BUILDING NEWS heralding the competition) promised better treatment from him than we have received. It must be admitted that, of all the unsatisfactory competitions that have taken place, this, the last, will pass down to history as the most unsatisfactory.

An esteemed F.R.I.B.A. has suggested to me that we competitors have a legal claim on the Cardiff Corporation for damages in respect to non-compliance with the conditions. This, however, I leave to other initiative, being more concerned with the moral of this most unfortunate competition.—I am, &c., NEMO.

[We feel ourselves uncomfortably convinced that this competition has somehow miscarried. Mr. Waterhouse is so far above reproach that we *should* have liked some explanation of the points raised by "Nemo," which seem to us serious ones, and we think it should have been forthcoming.—ED. B.N.]

SKETCHES BY CHARLES KEENE.

SIR,—It will probably interest you to know that the drawing by the late Chas. Keene which was reproduced in your issue of the BUILDING NEWS for Jan. 21, entitled "A Sketch of Turnham Green," is really a view of the Cathedral yard, Exeter, from the "Little Stile," looking eastward. The building in the foreground is occupied by Mr. F. Drake, stained glass artist, that adjoining is still, as it was in Keene's time, a tailor's shop. The view of the church of St. Mary Major is especially interesting as a record, for, since this sketch was made, the fabric has been rebuilt from designs prepared, I think, by the late Mr. Ashworth, architect, of Exeter. In the middle distance appear a portion of the west front and one of the towers of the venerable cathedral, and in the far distance are suggested the houses surrounding the close. The posts in the foreground have been replaced by prim iron railings, and the saplings Keene saw are now mighty trees.—I am, &c., W. T. MARTYN MEAR.

Wadebridge, Cornwall, Jan. 27.

CHIPS.

At a well-attended meeting of former scholars at Christ's Hospital School held on Monday, it was decided that a fund should be raised by "Old Blues" to furnish and decorate the chapel of the new school buildings at Horsham. Towards the cost, estimated by the architects, Messrs. Aston Webb and Ingress Bell, at £10,000, £900 was subscribed in the room.

The baptistery at the Holy Name Church, Manchester, was opened on Sunday. It has cost nearly £1,000. The baptistery is placed at the south-west of the church, and is an octagonal building, about 50ft. high. Terracotta tracery has entered largely into its construction and design. It is highly decorated, and the whole treatment, both of the baptistery and the marble font, is on the lines and in harmony with the general style of the church.

The Eyres Trustees are making application to the Court of Chancery for a grant of moneys to be expended in the preservation of the ruins of Dunstanburgh Castle, by pointing and underpinning. The works, if sanctioned, will be carried out under the supervision of Mr. George Reavell, jun., of Alnwick.

An inquest was held at the Royal Albert Hospital, Devonport, on Friday, on Henry Heath Symons, builder, 34 years of age, who died at the hospital two days previously, from the result of injuries to his head. On the previous Friday deceased, who resided at 2, Bridewell-terrace, St. Beaudeaux, was in his garden, and was struck by a piece of rock that came from a quarry where blasting was going on. He was conveyed to the Royal Albert Hospital, suffering from a fractured skull. The quarry in question is 77 yards distant from the spot where deceased was struck. The inquest was adjourned until Tuesday, February 8.

The corporation of Carnarvon have been considering ways and means to enable them to give practical effect to the Housing of the Working Classes Act. An important scheme of town improvement is now under consideration, by which a new main thoroughfare will be cut through the worst slum district in Carnarvon, where the sanitary authorities have already condemned a number of houses as unfit for habitation. Colonel Brown, of Chester, has consented to sell an adjoining plot of ground to the municipality for the erection of a number of workmen's model dwellings, and the plans provide for the laying out of three new streets of such model dwellings. The corporation will require to obtain borrowing powers to the extent of £10,000 to carry out the scheme.

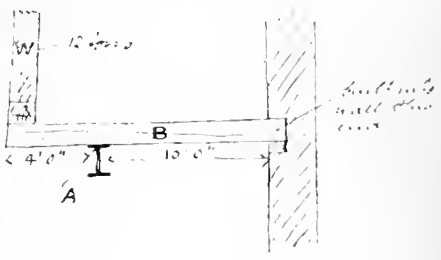
An unusually large and varied assortment of properties were offered at the Auction Mart last week, including a tea estate in Assam, a great industrial concern, a suburban building estate, and City and West-end freeholds. The results on the whole were highly satisfactory, although in several cases high reserves proved an obstacle to business. The gross realisation was £238,803—quite a record figure for the first month of the year.

By the General Powers Bill for next session of the London and North-Western Railway Company, power is sought to construct nearly nine miles of new railways in the county of Westmoreland in substitution for the steep gradients at Shap, to widen over two and a half miles in the same county, and also to widen about half a mile of their lines in the city of Manchester. Power is sought to raise £1,500,000 additional ordinary stock, and £500,000 by the issue of debenture stock.

Intercommunication.

QUESTIONS.

[11887.]—**Load on Girder.**—I should be obliged if one of your able correspondents would give me the formula for ascertaining the load that would be brought



to bear upon the girder A, irrespective of weight on floor, in consequence of the girder B cantilevering over, as shown on sketch, W being the weight at end of girder B. —M. S. R.

[11888.]—**Light.**—I have had built a warehouse, the gable end of which has four windows in (each about 6ft. 6in. by 4ft.), and overlooks land owned by another person. He has now sent me a letter asking for a yearly payment of 5s., as an acknowledgment for the enjoyment of such light. Would some reader acquainted with the right of light question inform me as to how to proceed in the matter? Am I enforced to make a payment at all? MACKENZIE.

[11889.]—**Protection of Iron.**—I should like to be informed if there is any paint or coating for ironwork that can be relied upon? Most of the common paints used peel off the iron. Is there not some new process recently introduced that prevents oxidation?—A. C. D.

[11890.]—**Cement Tests.**—Where can I find records of any recent experiments on Portland cement? Has there been any lately published in the "B.N."? I shall be glad with the date.—G

[11891.]—**Payments under Contract.**—Will some practical reader tell me what is the usual percentage of payment made on goods delivered on site and the time at which they are made from date of delivery? The goods are castings of columns, caps and bases, &c. Also when the remaining percentage ought to be paid? The usual condition as to these points would be of service.—INEXPERIENCED.

[11892.]—**Ventilators.**—Which of those in the market have the largest extracting power? If we can extract the foul air fast enough, the fresh air is bound to follow. Draughts can be discounted by properly devised inlets. I should like some information.—PERPLEXED.

[11893.]—**Artificial Stone.**—I have been told that there is a kind of stone manufactured which is much more durable than Portland stone, and is well suited for window-sills, copings, cemetery monuments, &c. If any of your readers will kindly give me any information as to the same I shall feel obliged, also the price in London? —A. M.

[11894.]—**Fire-Grate.**—Can any of your readers tell me of a good grate, with warm-air chamber fed by inlet from outside, and provided with means of warming the room above? There are plenty in the market; but they are of the ordinary construction.—S.

[11895.]—**Norwegian Houses.**—Can any reader tell me where I could obtain information regarding the construction of Norwegian timber houses?—DESIGNER.

[11896.]—**French Gothic Architecture.**—Where can I obtain information about the classification of French Gothic, corresponding to our own division into styles, and what are the best books to consult? The distinguishing features and mouldings are, of course, important.—S. T. W.

REPLIES.

[11884.]—**"Red" and "Yellow" Deal.**—I am obliged to "A. H." for his concise reply to my query; but still the terms are misleading to the trade, whether builders, carpenters, or joiners. Mr. Stevenson's remarks the other day confirm "A. H.," and I am glad to be reminded of the work he mentions. These are the technical points a student looks in vain for in the ordinary handbook.—A LEARNER.

[11886.]—**Board of Trade Appointments.**—Apply by letter to the Secretary of this department.—G. H.

Mr. Norman R. Wilson has been appointed assistant surveyor to the North Riding County Council.

Herr Rudolf Alt, the leading water-colour painter in Austria, has been knighted by the Emperor. The new knight is eighty-six years old, and, being too feeble to work, lives on a pension of one thousand florins a year, granted him last year by the town of Vienna. He painted by preference architectural subjects, mostly the interior or exterior of Gothic churches, and in this line he has no living rival. He has executed several hundred architectural water-colour drawings, each of which commands thousands of florins when on the market, but he has remained poor throughout. His younger brother, Franz Alt, aged seventy-seven, is also a celebrated water-colour artist, his speciality being landscape.

LEGAL INTELLIGENCE.

CURIOUS DISPUTE BETWEEN BUILDER AND BUILDING OWNER.—The case of Seager v. Wigglesworth came before Mr. Justice Darling at the Kent Winter Assizes on Saturday, and was an action brought by Mr. Laurence Seager, builder and contractor, of Sittingbourne and Sheerness, to recover £156 17s. 6d. damages for breach of contract and expenses incurred thereby, against Mrs. Charlotte Wigglesworth, a lady of independent means, residing at Queenborough. In March, 1896, defendant asked plaintiff to build four houses for her in Queenborough. While these houses were in course of erection, defendant approached plaintiff's manager with a view to plaintiff building her nine more houses and a shop. Plaintiff in consequence had interviews with defendant on the subject. He visited her at Queenborough, and plans were drawn up. To these the lady would not agree, and eventually she said she would have the new houses built on the same plan as the previous four. On the 20th of May a decisive conversation took place, when plaintiff went down to Queenborough, taking with him the plans for the nine houses and shop. The price agreed on was £1,325. For various reasons plaintiff did not commence building the houses for some time afterwards, but eventually he did start. The ground was stumped out, the site cleared, and scaffolding erected: but a misunderstanding occurred between the contracting parties, with reference to the first four cottages, and defendant lost her temper. She told plaintiff to stop the building, and remove all his articles from the building site. Considerable correspondence passed between defendant's solicitor and plaintiff, and eventually plaintiff agreed to remove his scaffolding, &c., from the ground, but when he sent down appliances to do this he was stopped by defendant. Some of his goods he had removed, but the scaffolding was left, worth about £33, and the defendant now told plaintiff that he could have this if he paid her £8 17s. 6d. for cartage and storage. There the matter rested. For the defence it was emphatically stated that no contract was entered into, and that plaintiff was told on various occasions in May, June, July, and finally in August, by defendant, that she would not enter into contract with him, looking at the delay which had occurred in the building of the previous four cottages, the time for carrying out their erection being lengthened to twice the period agreed upon. Defendant was willing to pay £7 7s., which it was agreed was a fair price as remuneration for getting out the plans which were sent to the Queenborough Town Council for approval. His Lordship having summed up, the jury found that no contract had been entered into; that £10 10s. was a fair sum for the drawing up of the plans for presentation to the town council, and that the goods belonging to the plaintiff were not wrongfully detained. With regard to the counterclaim for the carting and storage of the plaintiff's goods by the defendant, the jury awarded Mrs. Wigglesworth £10 10s. Judgment was entered for plaintiff for £10 10s. on the claim, and for defendant for a similar amount on the counterclaim, and plaintiff was ordered to pay the costs.

ARBITRATION CASE AT RHYL.—Mr. Baldwin Latham, C.E., concluded on Friday his arbitration at Rhyl with respect to a claim of £3,500, made by Mr. Jacob Biggs against the Rhyl Urban District Council for extras and for damages for delays in connection with the carrying out of the new sewerage works at Rhyl, of which he was the contractor. The council counterclaimed against Mr. Biggs the sum of £3,507, for penalties and for non-completion of the contract within the specified time. The arbitrator will make his award in due course.

THE PURCHASE OF HARROGATE WATERWORKS.—On Saturday, at the Westminster Palace Hotel, an arbitration involving a sum of between £180,000 and £240,000 was brought to a termination. It was a case in which the corporation of Harrogate are acquiring, under an Act of last Session, the undertaking of the local Waterworks Company. Mr. Shiress Will, Q.C., sat as umpire, with Mr. J. Mansergh and Mr. Fenwick as arbitrators, the former for the corporation and the latter for the company. It appeared that the company was formed in 1846, and that its share capital stood at £76,000 and the loan capital at £19,000. It paid no dividend till 1857, when some interest was paid on the 10 per cent. stock; in 1884 full dividends on all classes of stock were paid; and after a while so much profit was earned that the arrears of dividend were cleared off, this operation being completed a year ago. So sound was the position of the company that between 1886 and 1896 the net profits increased from £1,450 to £8,790. The company's valuers assessed the maximum dividend payable at 36·36 years' purchase, taking the ordinary stock to be of equal value to that of the preference. Some 4½ per cent. debenture stock they capitalised at 40 years' purchase. The total of the company's valuation was about £220,727, on which the usual allowance of 10 per cent. for compulsory sale was put, making £242,800. For the corporation it was stated that the proper basis to test waterworks was to take their capacity over a period of three dry years, such as 1887, 1888, and 1889. On that basis it was held that the available quantity would be insufficient for the requirements of the town, and the already large consumption was likely to increase by the further use of baths and lavatories. The valuations of the corporation witnesses ranged from £170,000 to over £180,000. Expert witnesses stated that in case of another very dry year they should anticipate a water famine. Eventually the umpire reserved his award.

IN RE JOSEPH WHALE, BUILDER, PORTHILL, BURSLEM.—At Hanley, on Friday, the public examination of this debtor was held. The debtor's statement showed gross liabilities £7,287 1s. 7d., of which £1,266 2s. 2d. was expected to rank. The assets were estimated to produce £683 4s. 11d., leaving a deficiency of £582 17s. 3d. The debtor attributed his failure to losses on various properties. In answer to Mr. T. Bullock (official receiver), the debtor said that since 1894 he had been engaged as a speculative builder, having previously worked as a foreman builder for Colonel Chambers, of Eccleshall. He commenced building with a capital of £150, and during the last two years he had erected about 46 houses. He borrowed money from various societies on security of the properties, and had an overdraft at the bank. He had suffered losses through untenanted houses, through law costs, and through auction expenses. The examination was adjourned, the debtor being ordered to file a cash account from January, 1895.

APPEAL UNDER THE PUBLIC HEALTH ACT.—E. WOOD v. THE MAYOR AND CORPORATION OF WIDNES.—The Court of Appeal, composed of the Lord Chancellor and Lords Justices A. L. Smith and Collins, had before them on Friday this appeal of the respondents from the judgment of a divisional court (Mr. Justice Lawrance and Mr. Justice Ridley), holding that the plaintiff was not liable, under the Public Health Act, to pay for private improvements carried out on his behalf by the mayor and corporation, the sanitary authority for the borough of Widnes. It appeared that Mr. Wood was the owner of Nos. 52 to 63, Terrace-road, Widnes; and on the 22nd March, 1895, the sanitary inspector served notice upon him, stating that there was a nuisance at the houses referred to, and requiring the erection of water-closets. Non-compliance with the usual notices having been reported to the corporation, their officers did the work, and summoned Mr. Wood to recover for the "private improvement" made, the first instalment of the cost—namely, £6 8s. The magistrates made an order for payment of this sum, with 9s. 6d. costs. The divisional court held that the resolution passed by the corporation requiring the work to be done was not valid, and set aside the order of the justices. Hence this appeal of the corporation. The Lord Chancellor, in giving judgment, said there was no doubt that the notices given to the appellant in this case was quite sufficient as indicating the houses alluded to. But the notice went farther, and stated that a certain system of closet must be provided, and that was going beyond the powers of the local sanitary authority. The effect of the order was that unless a certain system was adopted there would be no compliance with the requirements of the corporation. It was not merely an intimation to the owner of the house property as to how the work should be done; it was part of the order itself, and therefore it was impossible to contend that this was a sufficient compliance with the statute. Therefore the appeal would be dismissed, with costs. Lord Justice Smith said he quite agreed with the Divisional Court in holding that the notice was bad in law, and Lord Justice Collins concurred, and for the reasons already expressed.

PARTY-WALLS AND FOOTINGS UNDER THE LONDON BUILDING ACT.—THORNTON V. HUNTER.—In the Chancery Court last week Mr. Justice Romer heard this case from Clapham, in which the plaintiffs were Percy Thornton, M.P., and five others—namely, John Harris Tyers, Charles William Munslow, Frank S. Harnett, Thomas Ravenhill, and Charles Farley Trenerry, leaseholder of the premises, 63, High-street, Clapham. The defendants were Alfred Hunter, organ builder, of 65, High-street, Clapham, and Henry Somerford and Son, builders, of 138, Manor-street, Clapham. Proceedings arose on a claim made by the plaintiffs for an injunction to restrain the defendants from erecting, or allowing to remain erected, any wall or any footing upon the land of the plaintiffs known as No. 63, High-street, Clapham, and for damages sustained by them. The defendants contended that the London Building Act of 1894 gave them the right in the circumstances to place footings upon plaintiff's land for the purpose of rebuilding or building a new wall. The pulling down of a portion of the house, No. 63, resulted in the falling of the southern flank wall of the said house, which in its fall damaged the northern flank wall of the house, No. 65, High-street, Clapham, occupied for many years by Mr. William Baldwin, proprietor of the *Clapham Observer*. The plaintiffs called Professor Banister Fletcher, F.R.I.B.A., who had made a personal examination of the premises. He gave evidence that he saw the hole in the side wall of No. 65, caused by the falling down of the wall of No. 63 on Sunday evening, November 8th, 1896. The plaintiffs' wall and defendants' wall formed a party-wall, belonging to the joint parties—one-half to each. Defendants' counsel here claimed that the whole of the wall was built on their property. Witness continued that the wall was distinctly of a party character by requirement, and also under the Act. In the lower portion there were two walls about equal thicknesses, bonded together so far as the portion visible could be examined. Mr. Wilfred John Hardcastle, architect, and district surveyor for the central division of Battersea, agreed generally with Mr. Fletcher as to the inference of the age of the house. He went round to inspect, to see whether the wall appeared to be a party-wall, or two external walls, and he came to the conclusion that it was not a building inclosure. To the defendants' house there was not sufficient wall to protect from plaintiffs' house in certain circumstances. The 4½in. wall existent at defendant's house was not a sufficient inclosure. It could not have stood. It was a structure consisting of many pieces of wall put together, a piece of patchwork, with no distinct bonding. Charles Holland, foreman to Mr. Haydon, builder, of Hackney-road, said he was in charge of the workmen employed to clear the site of No. 63, High-street. He did not notice any mortar between the two walls. He pulled down the wall which abutted on the plaintiffs' house. He left it on Saturday afternoon, and then it was all right. It was all standing then perfectly, as high as defendants' wall. He left it standing shored up against the defendants' premises. The walls were not bonded together in any way. It did not fall down, it "blowed" down. Defendants' counsel then read numerous letters which passed between the solicitors, also particulars of a similar case, "Knight v. Perceval," and the Judge said that it was quite clear that if you had two external walls you do not make them a party-wall, even if they touched. It was a question whether by usage they became a party-wall. Mr. W. Baldwin, tenant of the premises, 65, High-street, Clapham, then gave evidence of the fall of the wall on Sunday night, Nov. 8, and of the damage thereby occasioned. The witness showed to the satisfaction of the learned judge that the walls were perfectly distinct, a cupboard on his own premises designed by the architect having its own brickwork at the back. Evidence was also given by Mr. Walter Henry Woodroff as to the measurement of the premises, and the walls, also by Mr. Alfred Conder, F.S.I., district surveyor, who accompanied Mr. Woodroff when he measured the premises. In summing up, the Judge said that he found as a fact that plaintiffs and defendants had each an external wall built on their own premises respectively. As a matter of fact, the defendants had an external wall on the defendants' own land, though they had committed a trespass in placing footings and foundations upon plaintiffs' land; that plaintiffs were at liberty to remove them; and he awarded damages £15, including costs of removal of said footings. He added that in the main point defendants were right, and he gave defendants general costs of the action, except so far as those costs had been increased by the question as to the footings. On the suggestion of the learned judge, defendants withdrew their counterclaim for damages to their house caused by the falling of the wall. The plaintiffs desired the erection of the party-wall in place of the two walls, whereas the defendants had erected an independent wall as a structure to repair the house. The Judge held that the defendants were right in the main, in the defence of the action; but he further held that the London Building Act did not give the defendants a right to put their footings upon the plaintiffs' land.

The Leicester Town Council have decided to raise the salary of their town clerk from £1,000 to £1,250 a year.

Mr. E. J. Hughes, the surveyor to the Newhaven Urban District Council, has tendered his resignation to that body after 14 years' service.

The Princess Christian visited Chatham on Wednesday, and laid the foundation-stone of the new town-hall in course of erection from plans by Mr. G. E. Bond, M.S.A., of High-street, Rochester, at a cost of about £30,000, and also formally opened the Victoria Tower, which has been added to the parish church, under the direction of Sir Arthur W. Blomfield, A.R.A. The tower has cost £3,300, and contains a peal of eight bells, cast by Messrs. John Warner and Sons. It is proposed to rebuild the nave of the church as early as possible.

In the Plymouth Guildhall on Monday evening a meeting of the townspeople was asked to express approval of the proposal of the corporation to apply to Parliament for a Bill in connection with the expenditure of £660,000, chiefly in connection with improving the Cattewater. By an overwhelming majority the meeting approved of the town council's action. A poll was, however, demanded.

Our Office Table.

THE elections to the three remaining vacancies at the Royal Academy, for the choice of two Academicians and one Associate, took place on Wednesday evening, and aroused much curiosity and interest in artistic circles. Fifty-one Academicians and Associates met at the sculpture gallery of Burlington House, an unusually large muster. As had been generally anticipated, the vacancies in the ranks of Academicians were filled by Mr. B. Williams Leader, the landscapist, and Mr. Seymour Lucas, the historical and portrait painter. Mr. Leader, who is 67 years of age, is brother to Sir E. Leader Williams, the engineer of the Manchester Ship Canal; his fellow Academician, Mr. Lucas, is 49. The voting list for the Associateship contained the names of about 160 painters, architects, and sculptors. In the preliminary ballot, Mr. Alfred East headed the list with 9 votes, Mr. Joseph Farquharson received 7, Mr. Napier Hemy and Sir George Reid, P.R.S.A., 6 each, and Mr. John Belcher, F.R.I.B.A, Mr. Aston Webb, F.R.I.B.A., and Mr. A. S. Cope 4 each. In the next ballot 10 votes were given to Mr. East, 9 to Mr. Napier Hemy, 7 to Mr. Farquharson, 6 to Sir George Reid, and 5 each to Messrs. Cope and Corbett. In the end, Mr. Napier Hemy defeated Mr. Alfred East by the narrow majority of two votes —26 to 24. Mr. Napier Hemy, the new A.R.A., who lives and works at Falmouth, is widely-known as a painter of sea and ships; his picture "Pilchards," was purchased by the Chantrey Trustees, from last year's exhibition at the Royal Academy, and now hangs at the Tate Gallery.

IT is stated that Mr. Aston Webb's designs, selected more than half a dozen years ago in the the competition for the reconstruction of South Kensington Museum, have at last been adopted by the Government, although in a modified form. It is now proposed by the Treasury that a sum of £400,000 shall be expended upon the works, to be spread over a period of ten years. We illustrated Mr. Aston Webb's designs in our issues of August 7 and 14, September 11, and November 20, 1891.

THE annual dinner of the architectural staff of H.M. Office of Works, 15, Whitehall-place, was held on Wednesday, January 26th, at the Commodore's Salon, Holborn Restaurant. The chairman, Mr. Henry Tanner, F.R.I.B.A., was supported by Mr. W. T. Oldrieve. The toast of the "Queen" having been drunk, a musical programme was gone through, the performers being members of the staff. The songs by Messrs. Reavell, Boult, and Neubronner, and the violin solos by Mr. H. B. Creswell were especially applauded. The toast of the "Chairman," proposed by Mr. W. J. H. Leverton in a witty speech, was enthusiastically received; Mr. Tanner's reply meeting with a similar reception. The toast of "Mr. Oldrieve and the Dinner Committee," proposed by Mr. Reavell, concluded the list.

THE London County Council have under consideration some alterations in the conditions of building contracts, and recently forwarded the new draft form to the London Institute of Builders for their observation. In returning the draft, Mr. R. S. Henshaw, the secretary of the Institute, states that his council "acknowledge that the proposed modifications are satisfactory so far as they go, though they leave the conditions still very onerous and stringent. The proposed arbitration clause would be more acceptable if modifications were made in several of the other clauses. . . . The contract form might be much more concise, and there is in it so much that gives a possibility of petty disputes that it is doubtful whether builders who can find sufficient work in other directions will trouble to compete under such conditions. The Council would be much better served were they only to invite selected builders, and adopt a simple form of contract. . . . The whole of the stipulations in regard to securing that contractors shall pay the standard rate of wages and observe the customary hours of working is altogether unnecessary, as it would be quite impossible for a contractor to carry on his business unless he conformed to the agreements in all these respects."

AT the quarterly meeting of the Glasgow Master Wrights' Association in the Building Trades Exchange, Gordon-street, Glasgow, on Friday night Mr. Ninian Macwhannell, architect, delivered an address on "The Modern Tenement —Constructive and Artistic." He submitted a number of plans of buildings recently erected in Glasgow, which he criticised, and stated that the first consideration in planning was the comfort and health of the incoming tenants, and that could only be secured by seeing that light and air penetrated every corner of the house. Dark recesses meant dirt, and it might safely be assumed that where light did not penetrate air did not circulate. There must be no stagnation of air. Every house should be so planned as to facilitate a change of air. He classified the modern tenement under two distinct plans—the internal staircase plan and the balcony plan—and favoured the internal staircase plan, because the balcony, projecting as it did 4ft. from the building, interfered with the light (this was not noticeable if the windows faced the north); it also interfered with the circulation of air. Balconies did not give the same amount of privacy that was afforded by the internal staircase. The planning of single-apartment houses in the same tenement with room and kitchen houses was to be commended and encouraged. Every house, not including the single-apartment house, should have its own water-closet; the system of providing one w.c. for two or four houses in new tenements was condemned. All gas-pipes should be exposed, and iron substituted for the usual block tin. Better glass might be adopted to glaze windows, as the amount of light was considerably modified by the quality of the glass. The tenement of to-day was well built, and for this Glasgow was indebted to the Buildings Regulations Act, and to the Master of Works Department. Speaking of cost, he pointed out that the tenements of room and kitchen houses built on the balcony plan for the Improvement Trust were about £40 per foot of frontage, as against £35 for those built by the speculative builder. The two-room and kitchen house, with scullery and bath-room, cost about £45 per foot of frontage. All over, tenements might safely be estimated at from 4½d. to 5d. per cubic foot.

THE Marquis of Bute has for some time past been reconstructing the old castle wall at Cardiff, from a point at the rear of Duke-street, for a distance of 100 yards parallel with the North-road. The wall has now been erected to within 30 yards of the corner, at which it will meet the other and older wall at right angles. A large multangular tower will be erected at the N.E. angle at which the walls will meet. For centuries the earth at this corner has sloped upward from the canal bank to a height of about 30ft. The excavations of the past few days have brought to light the fact that in the very heart of the earthwork there has laid buried for many centuries what appears to be the rubble foundation of an angle tower of undoubted Roman origin. Writing in his work upon Mediæval military architecture in 1884, the late Mr. G. T. Clark expressed his opinion that the castle is of Roman origin, but said that his "opinion is but moderately supported by scanty discoveries of Roman remains." This supposition is now amply confirmed.

THE excavations which are being made in connection with the rebuilding of the premises of Messrs. Berrill, in the Minories, at Birmingham, have once more revealed a portion of the foundation of the Priory of St. Thomas. The foundations were discovered on the occasion of alterations made a few years ago. They were the foundation-stones of an irregular wall, but what part of the original priory could not be determined, although from the discovery of the skeleton of a female within the wall it was presumably the wall of the chapel dedicated to the Blessed Mary. Interest was aroused by this discovery, and, by the care of the architect and builder, Mr. William Jenkins and Mr. Twigg, the remaining stones were again buried They have not had much rest, for the building is now being finally removed preparatory to the entire re-erection of the whole block—a proceeding which necessarily will entirely remove the last possible vestige of the priory. The date of the priory foundation was about 1280; but the chapel was probably enlarged or rebuilt by Fulk Byrmingham about 1340. The whole was surrounded by the burial-place or cemetery by the fraternity, the Augustinian Friars. In 1547 the friars and their prior were removed, and the Crown seized upon the whole estate, including the chapel. The reappearance of the foundation-stones of the priory has been looked for with some interest, and, by the direction of the architects, Messrs. Essex, Nicol, and Goodman, every care has been taken by the foreman and clerk of the works in having the ground reopened. Some of the stones give evidence of having been previously used, several of them having the colouring and whitened sides still preserved, and traces of colour still perceptible.

THE Cheshire County Council have adopted a plan prepared by Mr. H. Beswick, the county surveyor, for dealing with the law and old prison buildings of Chester Castle. A portion of the site will be handed over to the corporation of Chester free of charge, on condition that the corporation construct a new public carriage drive through this land, with grass verge on each side and one footpath; the grass verge on each side of the road to be planted with trees, and the space between the drive and the city walls to be fenced in and planted with ornamental trees and shrubs. The corporation are also to cut through the city walls and construct a bridge at least 25ft. span and 15ft. high at their own expense, and to continue the carriage drive across that part of the Little Roodee belonging to the county, and connect this drive with that now being made by the corporation across their part of the Little Roodee to the Grosvenor-road. The remainder of the land will be resold by the council for the erection of houses of £25 to £30 annual rental, to be erected to designs in harmony with the county buildings, and to be approved by the county. The land contains about 3,200 square yards.

THE London County Council discussed on Tuesday at great length two subjects, adjourning the debate in each case. The first related to a scheme to be laid before the Royal Commission for the taxation of site values in the County of London. The second referred to a project propounded by the Fire Brigade Committee for such an extension of the brigade as will secure the better protection of London from fire. Most of the recommendations of the committee were adopted unanimously. They included a large increase in the number of stations and appliances for the extinction of fires and of 61 in the number of men employed, the estimated capital outlay being £197,000 and the increased annual expenditure on maintenance being £26,000. It was stated that the new works would occupy 10 years for their execution, and that the cost for the first year would be equal to a rate of about one-third of a penny in the pound.

THE Carpenters' Company hold three courses of lectures in their hall during the year, and are issuing the programme of that series which appeals to a larger and more general audience than the highly technical courses given in the early summer and autumn. These lectures, which begin on February 21st, and are, of course, more especially addressed to those engaged in architecture and building, will be fully illustrated by experiments and lantern slides. The names of the lecturers are so well known that they require no comment from us. They are Professors Silvanus Thompson, Banister Fletcher, and T. Roger Smith, Mr. Lewis F. Day, and Dr. Longstaff. Sir John Lubbock and Sir Arthur Blomfield are among the gentlemen who have promised to preside. The subjects, &c., will be announced in our advertisement columns next week.

THE work sent in for competition at the annual exhibition of the Border Counties Master Painters' Association, which opened at Galashiels on Saturday, was judged on the previous day in the Burns Hall, Galashiels, by Mr. C. Charlton and Mr. R. J. Bennett, Glasgow. The judges state that they found a marked improvement in the work from former years. The apprentices' work was very good, the writing and decorative panels being excellent in drawing, execution, and colour. The following were the first prize winners in the respective classes:—Apprentices: First year, C. F. Howieson, Hawick; second year, James Macintosh, Galashiels; third year, James Hill, Hawick; fourth year, Robert Revilley, Galashiels; fifth year, Ebenezer Vannan, Galashiels; sixth year, James Hill, Hawick. A special prize of a silver medal for the best panel was won by James Hill, Hawick. Journeyman's Class: Robert Douglas, A. D. Clark, and Phil Dodds, Galashiels; and C. F. Howieson, Hawick.

The fifteenth annual dinner of the Clerks of Works' Association will take place at the King's Hall, Holborn Restaurant, on Monday week, the 14th inst. Mr. W. Howard Seth-Smith, F.R.I.B.A., will occupy the chair.

MEETINGS FOR THE ENSUING WEEK.

SATURDAY (TO-MORROW).—Architectural Association. First Spring Visit to Five Houses near Park-lane, W. Meet at Lord Ribblesdale's House, corner of Norfolk-street and Green-street. 2.30 p.m.

MONDAY.—Royal Institute of British Architects. "Housing of the Drama," by E. O. Sachs. 8 p.m.

Society of Arts. "Decorative Woodwork," Cantor Lecture No. 3, by Cyril Davenport. 8 p.m.

Society of Engineers. 7.30 p.m.

Liverpool Architectural Association. "The Quality of Strength in Architecture," by W. H. Bidlake, F.R.I.B.A. 8 p.m.

Surveyors' Institution. Adjourned discussion on "Technical Tribunals and Surveyors as Arbitrators." 8 p.m.

TUESDAY.—Institution of Civil Engineers. 8 p.m.

Leeds and Yorkshire Architectural Society. "Early Renaissance Sculpture in Tuscany," by W. H. Thorp, F.R.I.B.A.

WEDNESDAY.—Surveyors' Institution. Annual Dinner at the King's Hall, Holborn Restaurant. 6.30 p.m.

Society of Arts. "Compensation to Workmen," by A. D. Provand, M.P. 8 p.m.

Edinburgh Architectural Association. "The Vernacular of the Wren School," by J. A. Williamson, A.R.I.B.A. 8 p.m.

THURSDAY.—Royal Institution. "Some Italian Pictures at the National Gallery" (first of three lectures), by Dr. Jean Paul Richter.

CHIPS.

The treasurer of Guy's Hospital has received from Mr. Henry Lewis Raphael the sum of £20,000, to be devoted to the building of the "Henriette Raphael Nurses' Home," in memory of the late Mrs. Raphael.

A reredos of polished oak and a font have been placed in Great Baddow parish church as memorials of the late Mrs. Finch.

The work of renovating the organ of St. George's Hall, Liverpool, is now almost finished, and the instrument is to be reopened next week. Mr. Henry Willis, the builder of the instrument, has superintended the present alterations.

Mrs. William Bell Scott, widow of the well-known architect, painter, etcher, poet, and critic, the friend of Carlyle and Ruskin, has just died in Chelsea. She had reached an advanced age.

The Corporation of Leamington are about to build a technical institute and free library, at an estimated cost of £14,000, exclusive of site.

The plans for the arrangement of the town's yard, prepared by the borough surveyor (Mr. J. Ainsworth Settle, A.M.I.C.E.), have been adopted by the town council of Heywood. The fire-station is to face Hind Hill-street, and adjoining will be the firemen's dwellings, a dozen in number. Behind the fire-station there will be stables for the horses of the brigade, and also stables for 16 horses for the health and surveyor's department. Masons' sheds, store-rooms, &c., will likewise be built.

Mr. Walter A. Ducat, an inspector under the Local Government Board, held an inquiry on Friday in reference to an application of the Swinton and Pendlebury Urban District Council to borrow £26,155 for works of sewage disposal, and for private and public street improvements.

After a long discussion on Friday the General Purposes Committee of the Blackpool Corporation sanctioned the expenditure of £40,000 upon the extension of the electricity works.

Mr. T. H. Nesbitt, town clerk of Douglas, Isle of Man, has been appointed vestry clerk of St. George's, Hanover-square, London, in succession to the late Mr. Smith, at a salary of £600. There were seventy-two applicants.

A large discovery of old English coins was made on Saturday at Penicuik, near Edinburgh, and the Crown authorities are taking precautions that the collection be preserved *in toto*. So far 270 coins of the period of Edward I. have been unearthed. The coins were in rouleaux. The greater number consist of silver pennies and half-pennies minted between 1272 and 1307. The majority bear the London impress, Canterbury comes second, while the Bristol, Newcastle, and Durham marks also occur. A few bear the stamp of the Dublin Mint. Two of the coins are of Alexander III.

The new organ which Messrs. Hele and Co., of Plymouth, have built for use at the Bishopston Wesleyan Chapel, Bristol, was opened on Sunday.

The first sod was cut at Llandudno on Tuesday for the erection of extensive convalescent homes, in accordance with the will of the late Lady Forrester. The site is about a mile east of the town, commands charming views, and the buildings are to cost £50,000.

Trade News.

WAGES MOVEMENTS.

BELFAST.—Notices, terminable in three months, were served on Tuesday upon the Belfast building trade employers on behalf of the local carpenters and joiners, bricklayers, plasterers, and stonecutters, for an advance of wages and the cessation of work on Saturdays at 12 o'clock. The bricklayers, joiners, and plasterers ask for a halfpenny per hour increase, and the stonecutters three farthings. About 8,000 men are involved in the demand. Employés contend that the trade is extra good just now.

Schemes are afloat for extensive building operations at Tuxford, the opening of the new railway having created a great demand for dwellings. The Great Northern Company have acquired land adjacent to their station, where forty houses are to be erected. A private company has purchased the St. John's College site, on the Egmanton-road, close to the L. D. and E. C. station, where two rows of houses will be put up. The L. D. and E. C. Railway Company will erect houses for their staff on two sites of the Duke of Newcastle's land on the east side of the Great North-road, on a point where the new railway crosses the Newark-road.

The Muir Hall of Residence in George-square, associated with the University of Edinburgh, was opened by the Duchess of Buccleuch. It is intended to rent the bedrooms to the lady students. The alterations required to adapt the building to its new use have been extensive, and include the addition of two new stories and the entire remodelling of the interior. On the upper floors sleeping accommodation is provided for twenty-three students and the lady superintendent, while the ground floor is given up to a dining-hall to the back, and a drawing-room to the front. The kitchen and servants' bedrooms are placed in the basement. The architects are Messrs. Dunn and Findlay, of Edinburgh.

Leeds—Sunday School, Ventnor-street		W. F. Braithwaite, Architect, 6, South-parade, Leeds	—	
Manchester—Two Shops and House at Fairfield	Hyde's Brewery Co., Rusholme	Tom Cook, M.S.A., Architect, 39, Victoria Buildings, Manchester	—	
Halifax—Converting Two Shops into Bathrooms		Wm. Bennett, Superintendent, Royal Baths, Harrogate	—	
Ilkley—Steam Laundry, Cottages, and Stables	Sanitary Steam Laundry Co.	Raxendall and Critchley, Architects, The Grove, Ilkley	—	
Borstal, Kent—Four Cement Kilns and Chimney		The Secretary, Borstal Manor Cement Co., Borstal	—	
Newlay—Additions to House	William Braithwaite	J. Peakman, Architect, Hopwood Bank, Horsforth	—	
Hull—Additions to Shop, Hessle-road		E. Whitlock, Architect, 26, Scale-road, Hull	—	
Cork—House, Douglas-road	J. Wolfe	Arthur Hill, B.E., M.R.I.A., 22, George's-street, Cork	—	
Dersingham—Additions to Public-House		Louis F. Eagleton, Architect, Bank Chambers, King's Lynn	—	
Newcastle-on-Tyne—Villa, Rowland's Gill	Wm. Dixon	W. Rounthwaite, A.R.I.B.A., Archt., Mosley-st., Newcstle-on-Tyne	—	
Llanelly—Three Villas and Residences, New-road		W. Griffiths, Architect, Falcon Chambers, Llanelly	—	
Clifton—Free Methodist Chapel, Jacob's Well	Trustees	A. R. F. Trew, M.S.A., 22, Broad-street, Bristol	—	
Harrogate—House		William Squires, Royal Exchange Chambers, Leeds	—	
Newark—Six Residences, Spital Estate	Miss Stevens	Abraham Friend, Architect, 50, Bowbridge-road, Newark	—	
Buxton—Farm Buildings at Runshaw Moor		Jolly and Buckley, Architects, High-street, Chorley, Lancs	—	
Filey—Pair of Villas	Major C. J. Russel, Malton	C. H. Channon, Architect, Malton	—	
Haslingden—Workmen's Club		The Secretary, Station-road, Haslingdean	—	
Garforth Colliery—Eight Cottages	Owners of Garforth Colliery	R. Routledge, Manager, Garforth Colliery	—	
Bangor, Co. Down—Presbyterian Church		Wm. J. W. Roome, M.S.A., Whitehall Buildings, Ann-st., Belfast	—	
Ramsgate—Wing to Grammar School	Headmaster	Jas. Emes, Architect, 151, Ebury-street, S.W.	—	
Devonport—Rebuilding the Shades Inn		B. Priestley Shires, Architect, Central Exchange, Plymouth	—	
Bramley—Two Terrace Houses, Victoria Park Estate		A. E. Dixon, A.R.I.B.A., Architect, 5, Park-lane, Leeds	—	
Barrow-in-Furness—Alterations to House	W. Postlethwaite	E. M. Young, Architect, 90, Duke-street, Barrow	—	
Abertillery—134 Colliery Houses at Six Bells		C. Telford Evans, Architect, 8, Queen-street, Cardiff	—	
Chingford—Block of Shops		J. Edward Still, Architect, 82, Queen-street, Cheapside, E.C.	—	
Clones Creamery	Co-operative Creamery	Geo. F. Graham, President, Clones	—	
Buxton—Twelve Cottages, Harpur Hill		The Buxton Lime Firms Company, Limited, 8, Quadrant, Buxton	—	
Derrygonnelly—Creamery		D. Donaldson and S. G. Linton, Hon. Secretaries, Derrygonnelly	—	
Burley-in-Wharfedale—Ten Workmen's Houses	J. Gordon Black, Harrogate	Whitehead and Smetham, Architects, Albert Chambers, Harrogate	—	

ENGINEERING.

Radcliffe—Tanks, Filter Beds, &c.	Urban District Council	J. Sharples, Clerk, Radcliffe	Feb.	5
Newport—Steam Travelling Crane	Corporation	Albert A. Newman, Town Clerk, Newport	,,	5
Buckfastleigh—Outfall and Purification Works	Urban District Council	Edward Windeatt, Clerk, 19, High-street, Totnes	,,	7
Swansea—Reconstruction of Storm Water Overflow	Urban Sanitary Authority	John Thomas, Town Clerk, Guildhall, Swansea	,,	7
Belfast—Locomotive Steam Crane	Harbour Commissioners	W. A. Currie, Secretary, Harbour Office, Belfast	,,	7
Hexham—Gasholder Tank	Gas Company	Herbert Lees, A.M.I.C.E., Secretary, Gasworks, Hexham	,,	8
Rhyl—Extension of West Promenade	Urban District Council	Robert Hughes, Town Surveyor, Clwyd-street, Rhyl	,,	8
Appleton Wishe—Masonry of Iron Bridge	Northallerton Rural District Council	W. Fowle, Clerk, Northallerton	,,	8
Teignmouth—Covering Landscore Reservoir, &c.	Urban District Council	W. R. Hall Jordan, Clerk, Town Hall, Teignmouth	,,	9
St. Andrew's—Extension of Harbour	Fishery Board for Scotland	D. and C. Stevenson, Civil Engineers, 84, George-street, Edinburgh	,,	9
Holmside Village—Sewage Tanks, Bacteria Beds, &c.	Lanchester Rural District Council	W. H. Ritson, Clerk, Lanchester, Durham	,,	9
Teignmouth—Relining Hazeldown Reservoir, &c.	Urban District Council	W. R. Hall Jordan, Clerk, Town Hall, Teignmouth	,,	9
Hamilton—Pipelaying (about 13 miles of cast-iron pipes)	District Committee of Middle Ward	Leslie and Reid, 72, Great George-street, Edinburgh	,,	10
Barton-on-Humber—Tank and Gasholder	Gas Company	W. H. Goy, Secretary, Barton-on-Humber	,,	10
Hamilton—Boilers and Pumping Engines	District Committee of Middle Ward	Leslie and Reid, 72, Great George-street, Edinburgh	,,	10
Warkworth—Improving Houndean Bridge	Alnwick Rural District Council	H. W. Walton, Clerk, Alnwick	,,	12
Clitheroe—Water-Main, &c.	Corporation	J. E. Sharpe, Borough Surveyor, Clitheroe	,,	14
Redditch—Electric Lighting Works	Urban District Council	J. A. McMullen, M.I.E.E., Hornchurch, Essex	,,	14
Leeds—Laundry Machinery at Workhouse	Guardians	James H. Ford, Clerk, East Parade, Leeds	,,	14
Sheerness—Pier (1,294ft. in length)	Urban District Council	Vincent H. Stallon, Clerk, Trinity-road, Sheerness	,,	15
Wednesbury—Widening Bridge over Canal	Corporation	E. Martin Scott, Borough Engineer, Town Hall, Wednesbury	,,	15
Devizes—Two Steel Lancashire Boilers	Visiting Com. Wilts County Asylum	Joseph T. Jackson, Clerk, Devizes	,,	15
Middleton—Purifiers at Gasworks	Corporation	Timothy Duxbury, Gas Engineer, Gasworks, Middleton	,,	16
Balsall Heath—C.I. Well Cylinders, Moseley-road Baths	Birmingham Corporation	J. Cox, Superintendent Engineer, Kent-street, Birmingham	,,	17
Balsall Heath—Well Sinking	Birmingham Corporation	J. Cox, Superintendent Engineer, Kent-street, Birmingham	,,	17
Uppermill—Rebuilding Bridge	West Riding County Council	J. Vickers Edwards, County Surveyor, Wakefield	,,	19
Portland—Waterworks	Urban District Council	Ernest J. Elford, C.E., Engineer, Council Offices, New-rd, Portland	,,	19
Bridgnorth—Provision and Laying of a 7in. Main (1,800 yards in length)	Corporation	J. Taylor, Sons, & Santo Crimp, C.E., 27, Gt. George-st., Westmnstr	,,	21
Plymouth—Dock Entrance	Great Western Railway Company	G. K. Mills, Secretary, Paddington Station, London	,,	22
Martley—Water Supply Works	Rural District Council	A. W. Knott, Clerk, 14, Foregate-street, Worcester	,,	23
Denbigh—Cooking Apparatus at North Wales Lunatic Asylum		Wm. Barker, Clerk to the Visitors, Denbigh	,,	26
Guipuzcoa, Bilboa—Electric Tramway (30 miles) from Zumarrago to Zumaya		Commercial Department of Foreign Office, Whitehall, S.W.	,,	28
Pernambuco—Port Works	Government	Brazilian Ministry of Public Works, Rio de Janeiro	,,	28
Dorstone—Carriage Bridge across the Dore	County Council	J. F. Symonds, Clerk, Shire Hall, Dorstone	Mar.	12
Llangathen—Stone Bridge, Dryalwyn Ford	Carmarthen County Council	Thomas Jones, Clerk, County Council Offices, Llandovery	,,	14
Sophia—Electric Lighting of Town		The Mayor, Sophia, Bulgaria	,,	17
Madras—Utilisation of Water of Periyar Lake		Chief Engineer for Irrigation, Madras	July	1
Leeds—Settling Tank, Meanwood Tannery	Harold Nickolls	Thomas Winn, Architect, 90, Albion-street, Leeds	—	
Northampton—Water Main, &c. (two miles)	Rural District Council	Wm. Hull, Architect, 12, St. Giles's-street, Northampton	—	
Brindisi—Works to Harbour	Italian Government	Commercial Department, Foreign Office, Whitehall, S.W.	—	
Roscommon—Drying Apparatus in Workhouse		Ty. O'Keeffe, Clerk, Union Office, Roscommon	—	

FENCING AND WALLS.

Faugbawale—Boundary Walls and Rails	Committee of Presbyterian Church	W. Barker, Architect, 3, Richmond-street, Londonderry	Feb.	5
East Ham—Wrought-Iron and Oak Fencing	Urban District Council	W. H. Savage, Surveyor, Public Offices, East Ham	,,	7
Bakewell—Boundary Wall at Workhouse	Guardians	A. Howes, Clerk, Union Offices, Bakewell	,,	7
Plaistow—Dwarf Wall & Fence, Hermit Road Recreation Ground	West Ham Town Council	F. E. Hilleary, Town Clerk, Town Hall, West Ham	,,	8
Dalston, Cumberland—Brick Wall, Barras-lane	Carlisle Rural District Council	J. Bell, Surveyor, 1, Aglionby-street, Carlisle	,,	12
Morley—Retaining Wall and Culvert, The Bottoms	Corporation	M. H. Sykes, Borough Surveyor, Town Hall, Morley	,,	14
Hastings—Boundary Walls, Clarification Works, Bulverhythe	Corporation	P. H. Palmer, M.I.C.E., Borough Engineer, Town Hall, Hastings	,,	14

FURNITURE AND FITTINGS.

Scarborough—Wards of New Wing of Infirmary	Guardians	W. O. Woodall, Clerk, 32, Queen-street, Scarborough	Feb.	9
Dewsbury—Furniture, &c., for New Cottage Homes	Guardians	Joseph Peace, Clerk, Union Offices, Wellington-street, Dewsbury	,,	10

PAINTING.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2249.
FRIDAY, FEBRUARY 11, 1898.

SOLIDITY AND STRAW.

SOLIDITY as a quality in building has something to do with the temperament and moral character of the builder. We cannot expect it from a man who is accustomed to look only on the outside of things, who has been used to study showy elevations or materials. Cost often lies at the bottom. The desire to build cheaply and ostentatiously lends itself fatally to shallowness of building and shams. Cheapness in building has favoured all sorts of artificial substitutes for real material, veneered walls of ashlar, or terracotta or slabs of faïence, cased columns and beams, tolerable in their way if used within certain limitations, but grievously deceptive if made to represent structure. And has not the education of the younger generation of architects suffered from this low ideal of building? We think it has. The present generation is more superficial in many things. They know more trades, but not any one trade well. Take brickwork or masonry. Bond and masonry construction is taught in the technical school, but not practically. It would be hardly fair to say that our "up-to-date" student who "crams" for the examinations of any of the technical colleges, at the Institute, or for the exams. of the Science and Art Department at Kensington is so well up in practical carpentry or masonry as his predecessors. The young architect of the last generation may not have known so many methods and applications of graphic statics as the youth of to-day, but we suspect he was better acquainted with carpentry as a trade, and could design a roof truss with greater ease. Does it not also appear that this superficial tendency in the architect's education has something to do with the flippancy and shallowness of architectural taste, that it corresponds with the pretentiousness of modern buildings? If we take any dozen of the many business and commercial premises in our streets, what do they show but mere "skin-deep" ornamentation, and that of a very poor kind? Of depth, of modelling, of light and shade there is nothing—the designer has merely studied his elevation as a flat surface, and the work is either of ornamental terracotta, or faïence, or brickwork. In the details of the shop-fronts, the beauty of stained glass and metalwork is sought to be reproduced by the modern manufacturer. The "pattern book" is brought into requisition, for we may see the same design in the next street; but all is flat or coarse, and in a few months the front loses its freshness, and it all looks tame and commercial. Inside, various fabrics represent solid oak or plaster, solid marble or metal; but there is no solidity or substance behind, except rough stock brick walls, iron stanchions, and wooden partitions.

In no other profession is shallowness so soon discovered as in that of the architect. The man of shallow legal knowledge who undertakes to prosecute or defend in an action may fairly survive his weak law; a man of superficial knowledge, as a professor or a lecturer, may even be rewarded; but the shallow architect, who knows only his profession from books, or who has learned only the rudiments of the art, quickly comes to grief whenever he attempts to put his ideas into practice. An accomplished and captivating draughtsman, unless he knows the technicalities of building, has seldom, single-handed, been able to achieve success, because he has not the ability to translate his ideas into brick, stone, timber, or metal. Thoroughly competent as an artistic draughtsman, he has still only learned one side, and that the most attractive one of the solid fact we call building. He deals with surfaces and elevations, and can even make taking perspectives representing the solid building in its other dimensions; but he knows little of what underlies the several surfaces. His work, so to speak, is the mere envelope of the solid; his perspective is not modelling, but drawing in the "flat."

Nor does the man who has studied the theory only of his profession get on much better. His attainments languish or desert him whenthey are brought to the test of practical work, and he finds that, in spite of his theoretical knowledge, the practical "rule-of-thumb"—and often ignorant—workman has the best of him. In Sir John Wolfe Barry's remarks addressed to students at the Institute of Civil Engineers, these very trite but applicable words appear:—"Practical training can only be secured in the old-fashioned way by a young man seeing work done and learning from it the lessons of experience. In the engineer's office, in the workshops, and on works of construction, and these only, can a young engineer learn by experience what he can usefully assimilate and what he ought to reject, and then only will he be brought face to face with the demonstration of how largely the conclusions of theory have to be modified and discounted by practical considerations and the limits of the attainable." These last words contain in a nutshell the gist of the whole disagreement between theory and practice. The "limits of the attainable," or the limitations of the material, constantly make it very difficult to reconcile theory with the practical in building.

We presume many things in theory that do not practically exist. In dealing with masonry or brickwork construction, cement or mortar is often neglected, the wall is considered as a homogeneous mass exercising a uniform weight over a beam, whereas, in fact, it is a rigid coherent mass, and the weight on the beam would be more of a concentrated load on the centre; in other words, the effect of the bond or cohesion of mortar is not taken into account. Again, in our theoretical treatises on the arch, the voussoirs are often regarded as loose stones without friction or cement, or as a fluid pressure, instead of which, in actual failure of the arch, we find segments of it slipping down, or the crushing of certain stones. We talk of a thrust overturning a mass of masonry, or its sliding on a bed; the real fact is, the abutment gives way at a weak joint, or by yielding at the foundation. The breaking of an iron girder is not so often due to the want of flange section as to some flaw in the iron; and iron columns designed on strictly mathematical principles are found to fail from imperfect bedding throwing the line of pressure on one side of the real axis, or through some flaw in the casting. And it is the same with structures like roofs or bridges; their failure often arises from a defective connection or bolt, rather than from any fault in the design. All practical builders know how much is attributable to bad workmanship, which theory ignores altogether, and in this way theory has to be discounted by practical defects of execution. Hence we find that the mere draughtsman and the mere theorist have scarcely realised the ideal of an artistic building, though they go a long way towards the professional attainment necessary. Skill in modelling, so valued by the great sculptor-architects of the Renaissance, is lost sight of. We should like to see the art of modelling again take the position it once did. We do not mean to say it should take the place of construction or drawing, but it may very usefully be studied in connection with both these subjects in our designing classes. Solidity of effect can scarcely be said to be learned by perspective; but the study of models would greatly aid the student of perspective. The modelling of a building or group of buildings has an educative use, which cannot be supplanted by mere plan and elevation drawing. Only the man of imaginative power can arrange his building or masses in such a way as to produce an effective grouping; we have instances in our leading architects of this power. The value of retiring planes of building, quadrangular masses, and open courts can only be learned by modelling. Unfortunately, we have now few opportunities. Buildings like the Louvre, our Somerset House, and many of the colleges at Oxford are not erected every day, though now and then, as at Sheffield and Cardiff Town Hall, and in other modern institutions, the quadrangle arrangement is made a feature. Mr. F. T. Baggalay's remarks on the exhibition of depth or the third dimension are to the point in this connection. The French suggest solidity by showing the roofs of their great buildings over and beyond the walls, but we are apt to neglect this effect.

Modern substitutes for older materials have seriously effected the solidity of buildings. Take, as one example, a wall faced or veneered with stone or marble. It is constructed of rough brickwork with large mortar joints, and is faced with stone ashlar. The backing settles as the mortar dries, while the facing of stone, with fewer and narrow joints, takes the whole weight or pressure, and the consequence is, the face-work bulges or separates from the backing or core, or the wall has a tendency to buckle on the side of the brick. The settlement and crushing of stone-faced piers or pillars supporting great weights, as some of our cathedral towers, is an instance of a pillar veneered externally by wrought stone. Owing to the subsidence of the rubble core, the external shell of stone receives all the weight, and crushing takes place. There is another aspect of the veneered wall and pier. It affects solidity. The external appearance of the veneer of wrought stone deceives the eye. We assume the wall or pillar is solid throughout, that the external facing represents solid stones bonded throughout, but it is not so. Take, as another instance, a deep jamb or "reveal"; the facing has to be returned round the angle of opening to produce the effect of solidness. It costs labour to build in this way, and it may be often worth while to consider whether the extra expense of returning a more expensive material round the corner is not quite as costly as using solid "through" stones of an inferior kind? Again, we often see the angle of a building returned over the roof of a lower block, like a wing, and it is usual to face the triangular-shaped piece of walling with the more expensive material of the front, to give the effect of solidity; but the plan has this disadvantage—viz., that it is shirked where possible, and costly facing materials are generally confined to flat surfaces. The architect, in short, begins to shirk return sides, and hence it is that the custom of using facing materials has led to superficial treatment. Veneering has much value as a decorative expedient. What are our mosaics, frescoes, marble, and faïence linings but veneers to give beauty and colour to our brick and stone walls? But it has this danger—that it is often regarded as a substitute for solid buildings and materials of less value. The modernist, or the commercial man, says "Let us build a rough brick wall and line it with marble or faïence." Instead of giving solidity or internal relief by pilasters and piers, the effect is obtained by tiles or panels in marble, or decorations of plaster or embossed material. Modern substitutes for internal decoration has, we must admit, lent a great temptation to superficial treatment, and made it less possible in these days to

build solidly. Let us look, for instance, at the architecture, if we can so dignify the application, of our great hotels and restaurants. Large capitals have been expended on these often lavish undertakings, but, with few exceptions, we can hardly say they are examples of design worthy the expense. Have not our public-houses vulgarised all that we esteem in stained glass, art faience, veneers, ceiling decoration, and metalwork. Many beautiful crafts and styles and materials have been applied indiscriminately to the decoration of bars, buffets, and restaurants, till we see Classical legends, Elizabethan and Tudor ornament, heraldic badges and details dragged from halls like Little Moreton, Burleigh, and Longleat to adorn bars and coffee-rooms. To "such base uses" are these originals put, burlesqued, as they are, by the attenuated imitations of the manufacturer. *Sic transit* indeed may be inscribed on all such misappropriations.

PARTY-WALLS AND FOOTINGS.

WHEN a wall between two buildings forms a party-wall belonging one half to each, or when it is to be taken as two external walls, is a nice question often arising in cases brought into court. Architects, surveyors, and builders often stumble over the meaning, and the framers of Building Acts have found it difficult to make a definition that is entirely satisfactory. The definition of the term "party wall" in the London Building Act seems to have been drawn up with reference to ownership and occupation, as well as to user. There are two distinct meanings attached to the term in the Act—first, as a wall forming part of a building used, or constructed to be used, for separation of adjoining buildings belonging to different owners; second, as a wall "standing to a greater extent than the projection of the footings on lands of different owners." The latter of these seems to depend more on ownership, the former on user. Whether two "external" walls close together become a party-wall by usage is a moot question. A case of some interest came before the Chancery Court lately, and was reported in our last issue. Proceedings arose on a claim by certain plaintiffs for an injunction to restrain the defendants from erecting or allowing to remain erected any wall or any footing upon the land of the plaintiffs at No. 63, High-street, Clapham, and for damages sustained by them. The defendants contended that the London Building Act gave them the right in the circumstances to place footings upon plaintiffs' land, for the purpose of rebuilding a new wall. While a part of the house 63 was being pulled down, the southern flank wall of the said house fell, and, in its fall, damaged the northern flank wall of house No. 65. Evidence on one side was adduced to show that plaintiffs' and defendants' wall formed a party-wall belonging to the joint parties, one-half to each; but the defendants alleged that the whole of the wall was built on their property. The evidence as reported is not very clear as to the circumstances or construction of the wall. One witness spoke of a 4½in. wall as not a sufficient inclosure. It could not have stood, and was a patchwork, not bonded. The defendants pleaded that the walls were distinct, in fact, two external walls, and evidence was brought in support of this opinion. We may confine ourselves to the summing-up of the Judge, who "found as a fact that plaintiffs and defendants had each an external wall built on their own premises respectively." As a matter of fact, the defendants' wall was an external one on their own land, "though they had committed a trespass in placing footings and foundations upon plaintiffs' land; that plaintiffs were at liberty to remove them, and he awarded damages £15, including costs of removal of said footings." On the Judge's suggestion, defendants withdrew their counterclaim for damages to their house caused by the falling of the wall. "The plaintiffs desired the erection of the party-wall in place of the two walls, whereas the defendants had erected an independent wall as a structure to repair the house. The judge held that the defendants were right in the defence of the action; but he added that the Act did not give them a right to put their footings upon the plaintiffs' land."

The facts, as far as we can gather them, go to show how often so-called "party-walls," or walls of separation, are built or tampered with; this decision is against the assumption of the defendants to place footings upon their neighbours' land for the purpose of building a new wall. The Act does not, in short, give any right to put footings upon the adjoining owners' land. Had the wall not fallen and damaged the defendants' premises, this case would probably not have been heard of. We believe there are hundreds of houses in London separated by walls of this character built by both parties, where one party has built a thin wall on the footings of the adjoining owner. In the enlargement or extension of premises an independent wall is often constructed, but without any bond with the old wall. The consequence of this construction is that if A. happens to pull down his premises, or clear the site for rebuilding, B.'s independent wall is directly in peril, especially if the footings are touched. One may see numerous walls of this kind—a kind of piecemeal wall built against an older party-wall. Here and there the wall bulges, and very uneven and rough kind of brickwork is put up against it without any bond whatever.

Under the London Building Act, 1894, the rights of building and adjoining owners are set forth, so that in the future such instances as we have mentioned are less likely to happen. Thus, if a building owner desires to build a party-wall on the line of junction of the two lands, he has simply to serve notice on the "adjoining owner," describing the wall, and if the said adjoining owner consent, the wall is to be "built half on the land of each of the two owners," or in some other way as may be agreed, and the expense is to be defrayed by the two owners in due proportion, regard being had to the use which may be made of the wall by the two respectively. But if the adjoining owner does not consent to the building of a party-wall, the "building owner" may build the wall wholly on his own land as an "external wall," and he has also the right, at his own expense, a month after the service of notice to his neighbour, to place "on the land of the adjoining owner, below the level of the lowest floor, the projecting footings of the external wall with concrete," on making compensation for any damage caused thereby. When one external wall is built against another wall, the surveyor may allow the footing next thereto to be omitted. These regulations are just and reasonable. Sections 87 and 88 describe the rights of building owners to underpin, repair, or rebuild any party structure, to cut away footings or jambs from any parts or external wall in order to erect a wall against such party or external wall. If these rules were strictly observed, it would hardly be possible to find any disagreement between the owners of party and external walls. For although a building owner can do these things, the adjoining owner can require him to do certain other things for his own protection and convenience—to build chimney jambs, breasts, flues, copings, piers, &c. Unfortunately, these rules are not strictly observed; there is often a good deal of tension between the two owners, and each acts on his own responsibility. The decision of the Court refers particularly to the footings, the Judge held, as we have seen, that the Act did not give the defendants a right to place their footings on the plaintiffs' land—a ruling that seems to be in conflict with subsection (6) of section 87, where it is provided that the building owner has, after notice, a right to place footings below the level of the lowest floor on the land of adjoining owner, making compensation for any damage. The point is certainly doubtful as regards an external wall, unless the footing on the side of the other external wall be omitted, as suggested by the last clause of the section. Subsection 6 and this clause are, doubtless, rather conflicting.

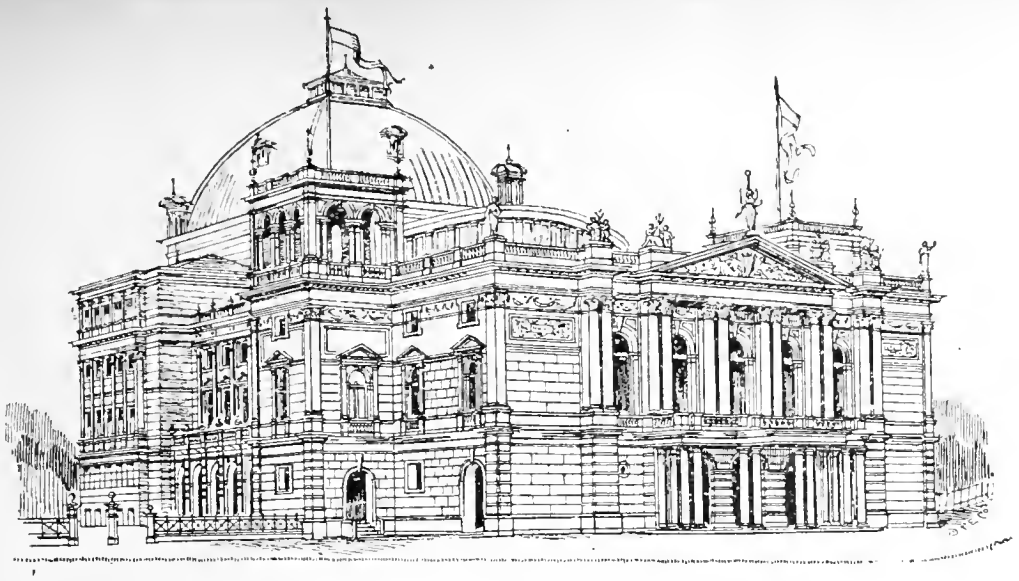
ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE seventh fortnightly meeting of the Institute of Architects for the present session was held on Monday evening at 9, Conduit-street, W., Mr. H. Louis Florence, Vice-President, in the chair. The secretary, Mr. W. J. Locke, announced that the Architectural Union Company had voted the sum of £30 as a donation towards the purchase of additional books for the library. On the motion of the Chairman, a vote of thanks was passed to the company for their generous gift, not the first of the kind made by the lessors of the premises in which the Institute have for so long had their habitat.

THE APOTHEOSIS OF AMIABILITY: A PROTEST.

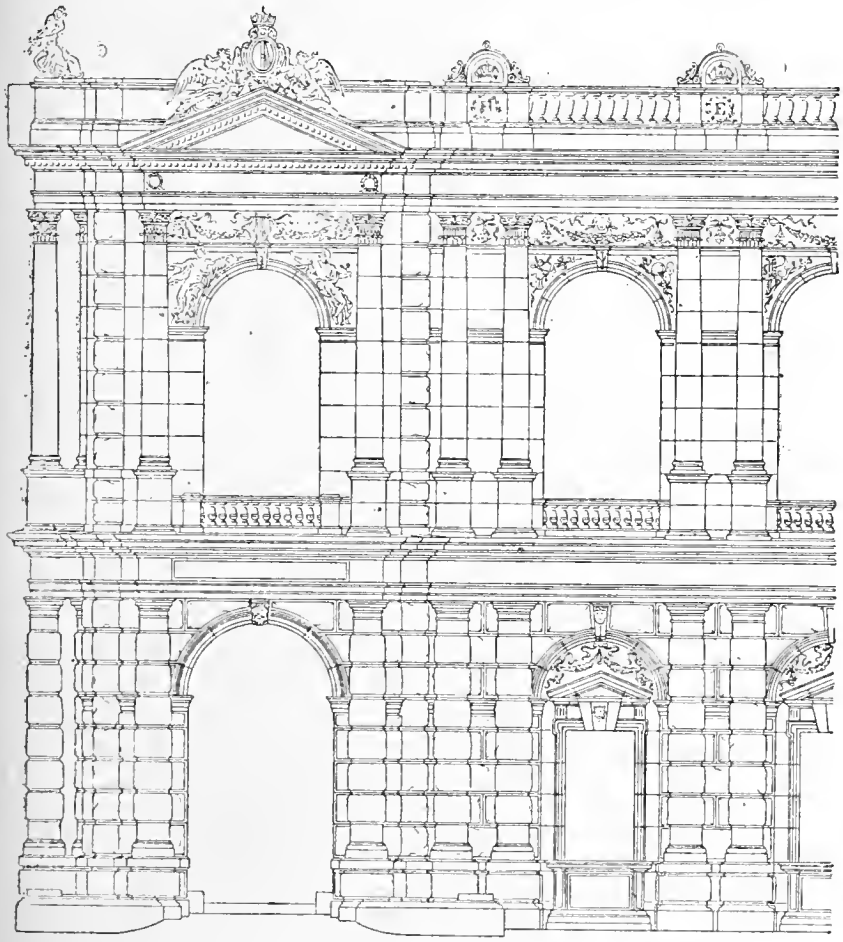
The Chairman said it was his privilege that evening to make an announcement which was yearly awaited by members with some amount of curiosity and even excitement—namely, the name which, subject to the approval of the members, the Council unanimously decided to submit to Her Majesty the Queen as a fitting recipient for the Royal Gold Medal in Architecture for 1898. Under the peculiar circumstances of the nomination he felt it would be scarcely sufficient to make the bare statement of the name to be submitted. He could confidently say that no name was more familiar to the members of the institute, than the one the council proposed to recommend, that of their President, Professor Aitchison, R.A. (some applause), and not only was he well known to his professional brethren in the United Kingdon, the Colonies, and on the Continent, but the President was also the representative of the literary side of the art, of that culture and erudition which were less usual among architects of the present day than of the immediate past. He should like to explain that this name was selected by the Council before they learned that Professor Aitchison had been chosen as a full Academician—a position which they were glad he had attained after undergoing the ordeal of a close election. Members were acquainted with their President's work in architecture and decoration, and many of them longed to see his Academy lectures collected in a series of volumes.

Mr. William Woodward said he rose with considerable reluctance to make a few observations on the announcement which had just been made—a reluctance which was increased by the hearty appreciation with which the nomination had been received, and in which he personally concurred. In making these remarks he did not intend the slightest reflection on the gentleman who had occupied the Presidential chair for the past two years. Personally, he yielded to no one in admiration for their President—his courtesy, geniality, good-nature, and perfect fairness in that chair were beyond praise, and the interest and charm of his addresses were gladly acknowledged by all. These very tributes to the President only formed the *raison d'être* of the observations he was about to make, and in which, he felt quite sure, he should have the meeting with him. Unless the award of this Medal was accompanied with the unanimous approval of the members, its bestowal became but a worthless bauble; but was their choice unfettered? If they referred to the wording of the Royal Charter, they would see that the Queen agreed to confer the Medal "at the recommendation of the Institute," and under By-law XI., section 63, it was provided that any twelve Fellows desiring to substitute any other name for the one recommended by the council, might sign a proposal addressed to the secretary containing the name to be substituted, at least fourteen days before the day of election. These extracts showed that the electorate was intended to be as wide as it was



"LESSING" THEATRE, BERLIN.

possible to make it within the ranks of the Institute. Now, what was the position of the members when the occupant of the Presidential chair was nominated by the Council for the Medal? It was almost impossible for members, however much they might feel the claims of some other architect had been overlooked, to vote for him in opposition to the President, and even should such a substituted name be generally accepted, it would detract very much from the value of an honour so conferred—indeed, the nominee so elected in opposition to the nomination of the Council would not be able to accept, at the hands of the President, the Medal with any degree of grace or self-respect. It was obvious, moreover, that rarely would a dozen Fellows be found to lend their names to such a candidature. The nomination of any former occupant of the chair was obviously not open to the same objection. The proposal of Mr. Aitchison's name was premature, and would have come with far more grace after he had vacated the chair. He would close by offering his most respectful protest against the principle in the proposal, and would ask that steps be taken to prevent such a nomination from being taken as a precedent. [The close of Mr. Woodward's remarks, which had been listened to in silence, was greeted with some applause from the younger members at the back of the room.]



PART ELEVATION, COURT THEATRE, VIENNA.

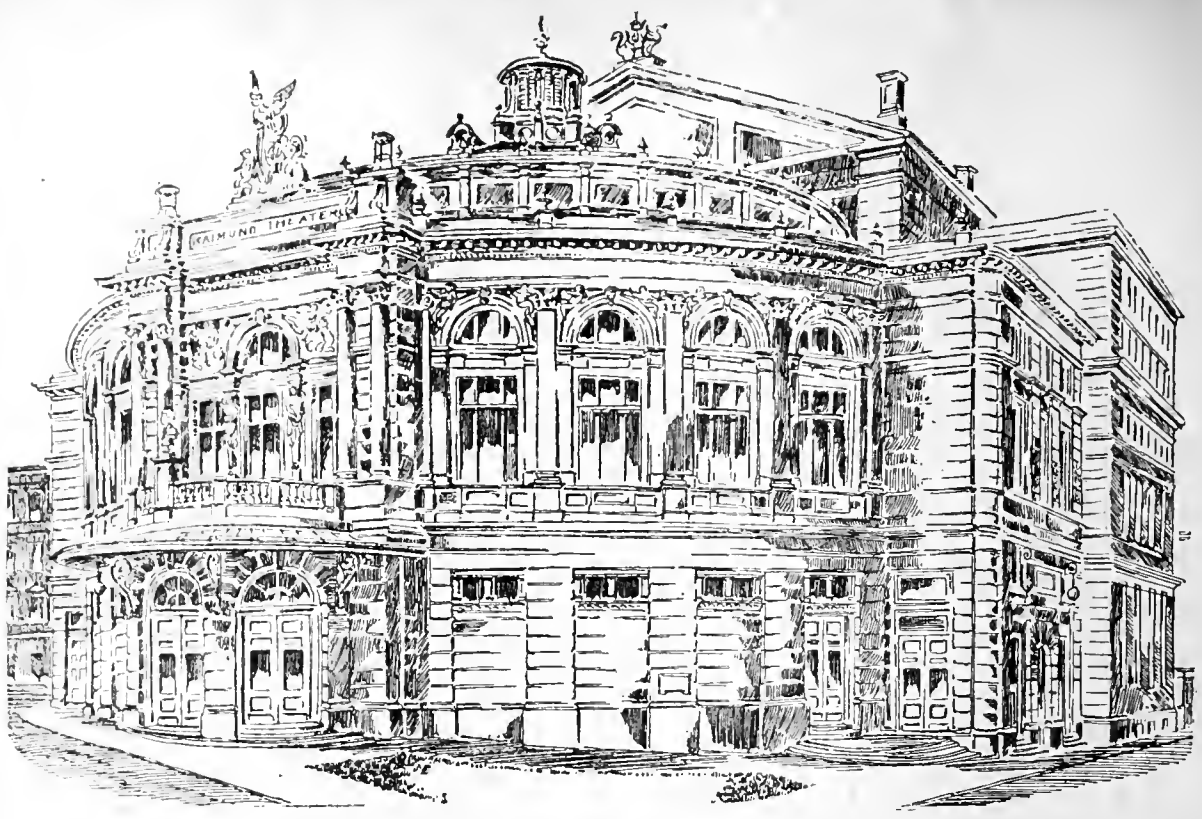
The Chairman: In reply to Mr. Woodward, I may say, firstly, that this is not an unprecedented action, a former president having been awarded the Royal Gold Medal during his term of office. (Mr. Woodward: Name.) I refer to Mr. Charles Barry; and, secondly, I may add that it seemed to us, as the Council generally, that in the year of Jubilee, in which architecture had not been specially recognised, some fitting honour should be bestowed on a leading architect. I think it will be felt by all that in this recommendation the Council have done well.

THE HOUSING OF THE DRAMA.

Mr. Edwin O. Sachs then read a paper on this subject, illustrating his remarks with a very large collection of drawings, some of which we reproduce. In his introductory remarks the lecturer explained that he did not propose to deal with questions of constructions or planning. His endeavour was to treat some of the aspects under which a playhouse devoted to the production of drama could be constructed, not only as a temple of art, but also as the pride of the nation or community to which it belonged. These aspects, he considered, demanded the attention of the architectural and allied professions; for, without the assistance of the architect of to-day and his co-workers, the successful issue of any movement for a better class of building was almost impossible. He asked: How was the drama, in its highest sense, housed to-day? How was it housed in the Metropolis, how in the provinces, how abroad? What principle guided the constitution of the home of the drama? What was the basis on which buildings devoted to the presentation of plays are erected? The answers to these questions the author held to be all-important when considering whether a playhouse fulfilled the function for which it was provided. They were also essential, if we wished to know the line on which a modern playhouse ought to be built.

LONDON PRIVATE THEATRES.

The author proceeded to show that London had no other form of playhouse than what was termed the private theatre. However high a standard might be reached by productions associated with individual examples, privates theatres could not be considered otherwise than having their basis in commercial enterprise. This commercial spirit was but rarely shaken off, even by a management of the highest order. It was important to define the distinction as to when a playhouse formed part and parcel of a theatrical business, and when it could simply be classed as an investment, the building being leased at its market value. It was shown, too, how for a theatre—whether built for direct management or as an investment—the site, the building, and the equipment were plain questions of rent-roll and £. s. d. What was more, the London playhouse was but seldom erected by the man who could sail an easy course with a large banking account at his back. With few exceptions, they



RAIMUND THEATRE, VIENNA.

found a most complicated financial basis, where questions of option, of mortgage, and the like predominated. The same held good for our provincial centres, with the one exception, that of the Memorial Theatre at Stratford-on-Avon, which had a special building fund, voluntarily subscribed, with the view of erecting a monument to Shakespeare. A like state of affairs also existed in our Colonies, and, with one or two exceptions, in the United States.

CONTINENTAL THEATRES.

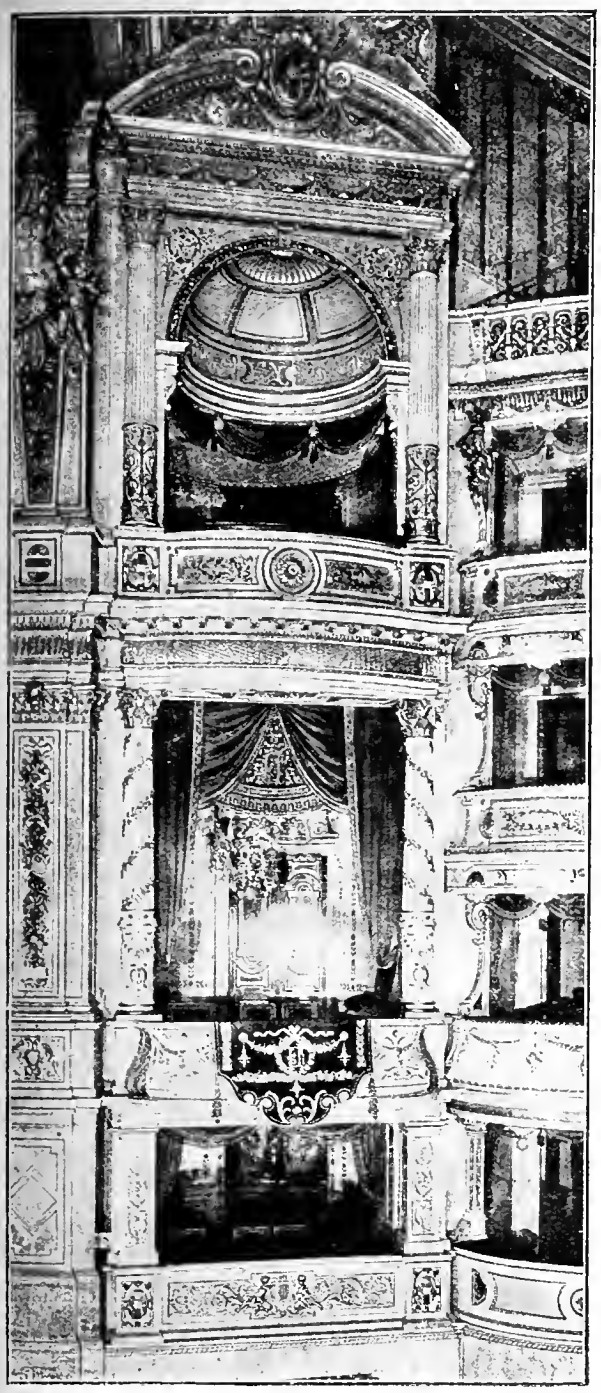
But on the Continent we found a very different state of things. Among Latin countries in the South of Europe the private theatre was met with to a considerable extent. We also found the private theatre in large capitals of the Teutonic countries in Northern Europe. We, further, had the private theatre, which was subsidised by the State or otherwise, notably in Paris and Northern Italy. The private theatre, however, he argued, was not the typical home of the drama for the Continent. Principally the Municipal, the subscription, or endowed theatres prevailed, and also, to a certain extent, court and national theatres. Commencing with the Municipal theatre, Mr. Sachs pointed out that its object was generally educational and recreative, the low price of admission enabling all classes to witness the performance. Beyond the original outlay on the building, the ratepayers either allowed some annual vote towards maintenance, or they simply guaranteed to meet any deficit, should there be one. It was merely a question of good stage management and the pricing of admission; for, as there were no profits to be made, the plays were practically presented at cost price. Next, the subscription theatre was a gift presented to the town, sometimes by one or more of their wealthy citizens, at other times by a large section of the community, who voluntarily desired to participate in providing the city with a suitable playhouse, and who contribute from a few pence to some thousand pounds, according to their respective circumstances. Finally, the endowed theatre was shown to be an institution for which land and building were presented, together with a sufficient sum put in trust to cover the maintenance of the block, and any reasonable deficit on the productions. It is the *bonâ-fide* endowed theatre of this description that rightly ranked with some of those generous gifts of endowed picture galleries, public libraries, and artisans' dwellings for which this country was distinguished. The most recent form of the subscription theatre was the "People's" Playhouse, voluntarily subscribed for by every class of the community, and conducted on co-operative lines, while a particular form of the endowed institution was the playhouse which had been provided for on philanthropic lines for the entertainment and elevation of the working-classes in the same way as many of our free libraries were established. Now, each of these—the municipal theatre, the the subscription theatre, and the endowed theatre—was essentially a public institution. The standard of its founders was a high one, and where this was the case it followed that the conception and rendering of both interior and exterior—in other words, the architectural lines—ought to attain an equally high standard. The municipal theatre practically always stood as a monument to the prosperity and culture of a locality, and the architecture of the subscription theatre was intended to give a similar impression. It was further shown that national, Government, and Court theates were primarily luxuries not so much intended to afford suitable homes for the drama as to serve as places of entertainment and ceremony for monarchs or state officials. Being the outcome of luxury, however, these buildings frequently became veritable palaces of luxury, for nowhere was the play more sumptuously housed than in these establishments.

THEATRE DESIGN.

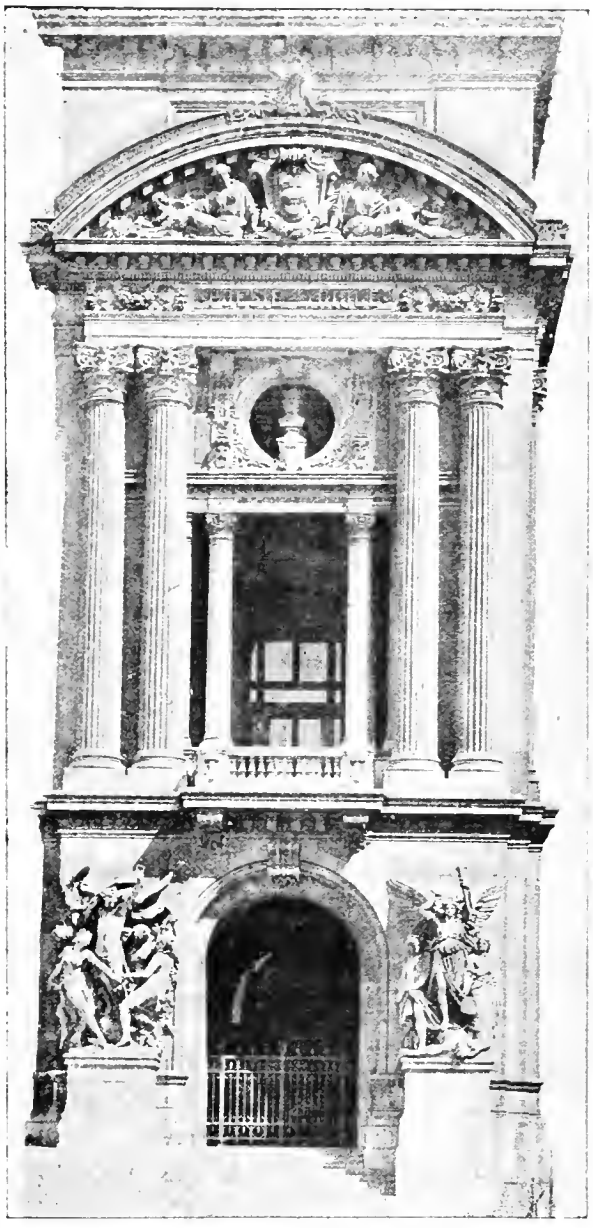
Mr. Sachs then referred to the circumstances which governed the design of a theatre, and explained how, in the private theatre, we had only a problem of economy to solve, and the only regard that had to be given to the architectural rendering was whether the individual holder or lessee considered that his audience required a little more gilt, a little more York stone, art in its best meaning, a semblance of art, or the gaudy treatment of an advertisement. A few managers, though risking their money, had thought of the suitable housing of the drama, independently of the absolute restrictions of £ s. d. Sir Henry Irving was an exception when he first put the old Lyceum in order in 1878. As a rule, the architectural merit of the playhouse was considered a matter of minor importance, as long as there was the customary supply of velvet and gilding in the auditorium. The London manager and his provincial colleague had only to cater for the pleasure of a sensation seeker practically devoid of any feeling for architecture, and with little reverence for dramatic art. The British public cared very little for architecture. It was otherwise outside our isles. With a genuine reverence for dramatic art, there was also on the Continent a genuine interest in architectural work, with the result that the play mostly found a worthy home amid appropriate and dignified surroundings.

THE THEATRE ARCHITECT.

The London playhouse was generally placed in the hands of architects who were merely good planners, good constructors, and business men, with a qualification of being able to provide for a maximum audience at a minimum outlay. With but few exceptions, it was of little importance if the so-called theatrical architect had the true feeling of art, if only he could secure the latest trick of the plaster manufacturer to catch popular taste. What counted more than any repute for architectural design was that the architect should have the talents and facilities of a financial agent, and be able to find money for the enterprise. The late Mr. Phipps told the lecturer that he would have frightened away his clients if he had spoken of architecture with a big "A." They would have thought him expensive, a faddist, or anything else but what they wanted. He purposely avoided trying even to make his façades or decorations presentable, for fear of being thought an art architect, and losing his theatrical *clientèle*. Of the many private playhouses that he designed, Her Majesty's theatre was the only one where there was any serious attempt made at architecture, and this was mainly due to Mr. Tree having indicated that he wished to have something above the commonplace. Of private theatres by other so-called "theatrical architects," the lecturer did not know of any that could boast of architectural pretensions. At present, the only theatre that deserved serious attention on account of its rendering was a small one at Cambridge, the work of Mr. Ernest Runtz. The same architect's new playhouse at Peckham promised, however, to show an architectural rendering of a much higher order. His variety theatres, by the bye, showed yet better work. Mr. Darbyshire, of Manchester, had also conceived some excellent plans, on true art lines, in connection with the variety theatre, and Messrs. Collcutt, D'Oyly Carte, and Holloway similarly did excellent work at what was now the Palace Theatre of Varieties. Abroad, the architect of a playhouse had to be an architect in the very highest sense of the term. Where a municipal monument, the gift of a subscriber, or a Court or Government theatre had to be dealt with, it was only natural that every effort should be made to obtain a good building, and even in the private theatre the necessity for



PROSCENIUM BOX, COURT THEATRE, VIENNA.



DETAIL, PARIS OPERA HOUSE.

catering for people who took an interest in architecture and respected the drama compelled the architect to be something more than a mere constructor. There was, in fact, no class of architectural work which put forward more numerous, complex, and essentially technical demands, and required at the same time that the rendering should not fall below the highest standard of taste, than that of the theatre.

EXAMPLES OF PRIVATE THEATRES.

Views and drawings of a very large number of theatres were shown and described with the object of illustrating Mr. Sachs's arguments. The collection embraced playhouses from all parts of Europe, including Russia, Scandinavia, Roumania, and other countries not popularly associated with the drama. The great superiority of design in the Court, national, municipal, and subscription theatres was indicated, particular emphasis being laid on the fact that of our own playhouses the Shakespeare Memorial was one of the few exceptions where considerable architectural merit was observable, and this was practically an instance of a subscription theatre. In London the late Mr. C. J. Phipps's Her Majesty's Theatre stood head and shoulders above the other West-End playhouses, Daly's came next, then followed several somewhat above the average, like the Duke of York's Theatre, and the Shaftesbury, and the Lyric; but none of these could be confused with a suitable home for the drama. If they glanced round the suburban theatres, they found a similar state of affairs. Turning next to the Continental playhouses built under almost identical conditions—i.e., those of a financial enterprise, with the one exception that the general public demanded that the play should be suitably housed and had some interest in architecture. In conception, in outline, and in planning some of these buildings took a very high position, and even in their architectural treatment merited considerable attention. The Lessing Theatre at Berlin was an excellent example of a private playhouse; but in every private institution it was evident that the architect had been cramped, even where the excellence of his intentions was obvious.

MUNICIPAL, SUBSCRIPTION, AND ENDOWED THEATRES.

The author next dealt in detail with examples of this class of playhouse, remarking that the only subscription theatre in this country was the one at Stratford-on-Avon, built at a cost of £20,000, where every possible care had been taken to invest a building with due dignity, and with due regard to its association. On the same basis we found so many interesting playhouses abroad, among which he had singled out Heinrich Seeling's three municipal theatres at Halle, Bromberg, and Rostock, the small municipal theatres of Salzburg in Austria, erected by Messrs. Fellner and Helmer, and their municipal theatre in Zurich. In these and in the subscription theatres they saw that freedom from monetary anxieties, reverence for the drama, and the demand on the part of the general public for the suitable housing of that art, as well as for good architecture, resulted in playhouses which fulfilled both ideal and practical requirements in every way.

COURT AND GOVERNMENT THEATRES.

It is among the court theatres that we had the most magnificent home of the drama extant. The Vienna Court Theatre, better known as the Hofburg, took the leading place among all dramatic houses. It was the greatest monument that has ever been erected in this direction. Erected at a cost of nearly £350,000, it was planned to hold an audience of 1,175 persons. It could be entered for the low price of sixpence. As an example of technical skill brought to high perfection, it was

the foremost home of the drama that had yet been created, both from the artist's, the architect's, and the actor's point of view. The structure was the outcome of the combined efforts of Gottfried Semper and Baron Hasenauer. The plan and the general lines of the design embodied the results of Semper's long study on the question of so-called radial planning, whilst the decoration and equipment gave expression to that wonderful delight in characteristic detail and ornament in which Baron Hasenauer excelled. Semper's experience at the Dresden theatres formed the stepping-stone for the general conception, and Baron Hasenauer's experience in the decoration of the great Vienna Court Museums also stood him in good stead. Apart from the ideal surroundings of this structure, which was situated on one of the most beautiful boulevards of the Austrian capital, it was the segmental treatment of the façade and its two wings which at once struck the eye, and gave this playhouse its individuality. The wings were due to the special requirements of the site and the desire to add to the importance of the block; but the segmental treatment was solely the outcome of the system of radial planning. The general grouping of the block was remarkable for the rational manner in which the exterior expressed every part of the interior arrangements. This characteristic was likewise very evident in the rendering of the principal façade. In the interior, the segmental foyer was certainly the chief feature, and the same formation was given to the grand vestibule and also to the minor lounge attached to the third and fourth tiers. As regarded the conception of the grand foyer, with its simple grouping of tiers of pilasters, its exquisite colour study and decoration, it was impossible for him to say more than that, with the aid of brilliant workmanship, perfection had been very nearly achieved. He also called attention to the manner in which the two grand staircases rose from the street level to the first tier in one broad flight, and in the auditorium, again, alluded to the great prominence given to the Royal boxes in the proscenium, and the central State box. The careful and varied decoration of the box divisions was remarkable, and in the ceiling there was a skilful blending of semi-relief work with painted surfaces which had a note of originality. In its construction the building was remarkable for the extensive use of iron and steel in the containing walls of the auditorium, which were practically composed entirely of metal plates so fitted together that the intermediate spaces were used as ducts for ventilation and warming. Having also described the Paris Opera House, designed by M. Charles Garnier, and the Raimund Theatre at Vienna, the lecturer closed with an

APPEAL TO THE BENEVOLENT MILLIONAIRE.

He argued that we could not expect from the private theatre what the other classes of structure gave us, while our national institutions were such as to make it highly improbable that we should, within reasonable time, have either a Court theatre or a State theatre; and, with the few exceptions in our most go-ahead cities in the North, he considered it unlikely that we should even soon see the municipal theatre. He asked if it was not time to consider the question of subscription and endowed theatres seriously. Why, if we subscribed to the erection of picture galleries and the homes of other arts, could we not subscribe to the theatre? If we endowed museums and libraries, why could we not similarly endow the theatre? If we wished to erect monuments to mark the culture and prosperity of our times, why should they not take the form of playhouses? And if it was the universal desire that facilities for education should be given, why limit our gift to the collection and distribution of books, or the collection and presentation of art treasures? Calling attention to the many institutions by which England had become great, Mr. Sachs advocated that the citizen should take the initiative himself, and, either by subscription or through endowment by the wealthier members of the community, give us that high standard of playhouse which we should rightly long have had. He concluded by urging that the architect should advocate the subscription and endowed theatre as the only practical road at the present time towards the drama being suitably housed with due dignity and full regard to the possibilities of architectural design.

In opening a discussion on the paper, Mr. BERNARD SHAW said, speaking both as a dramatic critic and as a member of a London vestry, he could see considerable and, indeed, almost insurmountable difficulties in the way of obtaining a municipal theatre. The multiplication of suburban theatres showed that private enterprise was taking good care of itself so far as the provision of houses for the drama was concerned. Nothing would, he believed, be expended upon theatres in England which were not directly remunerative, and he warmly sympathised with Mr. Sachs's endeavour to stimulate a demand for a better architectural treatment of the buildings.

Mr. WILLIAM ARCHER could not say he was entirely in sympathy with the author, but he felt that better surroundings for the drama would raise the general conception of the art. The drama suffered enormously from the fact that most of its temples were disguised as gin-palaces, or sandwiched in between them. He referred to the practical difficulties which beset subscription theatres, and protested against the supposed necessity for more Ibsenism in our theatres; while he was also certain that managers and actors could not live on Shakespeare or any other exclusive revival of old plays.

Mr. ALFRED DARBYSHIRE said that in Manchester some enthusiastic idiots, of whom he happened to be one, were endeavouring to take steps for the establishment of a municipal theatre. He paid a tribute of respect to the memory of Mr. C. J. Phipps, remarking that his best work was his last one, Her Majesty's Theatre.

Mr. CECIL RALEIGH humorously remarked that, as a working dramatic author, depending on royalties for a livelihood, he had been shocked to find that Mr. Sachs held up for admiration as the ideal theatre the Court at Vienna, which held an audience of less than 1,500, with sixpence as the rate of admission. He would ask what did it matter what the outside of a theatre—or, for the matter of that, the inside—was like? The play was the thing people went to see, and if they were only inclosed in four square brick walls, it would not matter a cent. to the spectators.

A vote of thanks to the lecturer was heartily accorded on the motion of Mr. E. A. GRUNING, seconded by Mr. THOMAS BLASHILL, and was acknowledged by Mr. Sachs.

THE ARCHITECTURAL ASSOCIATION.

THE seventh ordinary meeting for the present session of the Association was held on Friday evening, the President, Mr. Hampden W. Pratt, F.R.I.B.A., in the chair. Messrs. E. S. Curran, A. H. Longhurst, H. E. Sabey, and D. Stewart were elected as members. The President announced that the class of elementary physics would begin on Thursday, the 10th inst. (yesterday), and that for specifications and estimates on Friday, the 18th inst.

HAMPTON COURT.

A full and interesting paper on this palace, illustrated by a series of drawings and plans—some from the author's forthcoming work on the "Later Renaissance"—others executed by Mr. H. P. C. Maule*, and to which the R.I.B.A. silver medal was awarded two years ago, also by plans of Wren's period, lent by H.M. Office of Works, and by some excellent lantern views, was read by Mr. JOHN BELCHER, F.R.I.B.A. The lecturer explained that he should treat his subject from the architectural standpoint, and then endeavour to trace the architectural developments found necessary to meet advanced requirements. Most palaces came under the category of "Public Buildings," but Hampton Court had the further distinction of being a combination of domestic and public building. Its beginnings probably imparted to it the homely character it still retained. Before it became a Royal palace there was a country mansion on the site, and to this Wolsey probably added his palace. It belonged after the Conquest to the De St. Valery family, who in 1217 handed it over to the Knights of St. John of Jerusalem. About three hundred years later, this estate, with the Manor House which had always been known as "Hampton Court," was leased for 99 years to Cardinal Wolsey, at a rent of £50 a year. From this time, its history as a palace commenced, and building operations on an extensive scale were proceeded with. But it is not very clear whether there was any architect, for such works were most frequently carried out by a combination of artists who worked together on traditional lines in perfect harmony—the architect, the master mason, the master carpenter, and all the several artificers keeping within the limitations of their respective crafts. No doubt there was a leader or supervisor, whether called surveyor of works or clerks of works or (later) architect. He was "first amongst equals." Seventeen years later, when the work was carried on by Henry VIII., there were two names mentioned in the Hampton Court bills—Henry Williams, a priest, "Surveyor of Works" at Hampton Court, who would appear to have supervised all the details, and Eustace Maseal, who was "Clerk of Accounts." The latter was sometimes spoken of as the "Clerk of the Works," and was also clerk of the works under the Cardinal for his college at Oxford, where the details were similar to those at Hampton Court. These titles were still kept up at Hampton Court—there were still the "Clerk of the Works," the "Master Mason," the "Master Carpenter," and so on. These and the traditional methods had been passed down from the 16th century without any break. Mr. Law, the able historian of Hampton Court, had found, after an examination of the carefully preserved accounts for the several works during the reign of Henry VIII., that the workmen were all Englishmen. Mr. Belcher pointed out, however, that both Wolsey and Henry VIII. had part in bringing about the Renaissance; they both imported Italian workmen, and they both employed them at Hampton Court on decorative work. These foreigners were not builders, but only carvers and decorators, and we could trace their influence in the work of the Englishmen. Another example is in the plaque containing Wolsey's arms,* also in terracotta. These and the roundels had well-developed Renaissance details, which were evidently not regarded as in any way incongruous by Wolsey or Henry VIII. On the other hand, the great pendants of the hammer-beam roof of the Great Hall, which were Italian in character and feeling, were the work of a Londoner, Richard Ridgo, who had come under the refining influence of the Renaissance. It was not improbable that the old Manor House, which he found on the site, was incorporated by Wolsey in his new building, but no trace of this was left. Wolsey's palace was evidently quite up to date in its arrangements and appointments. It was natural that the plan should partake of the collegiate quadrangular form. Yet on the west front there was a new departure, for at the western entrance two projecting wings formed a three-sided court, each wing, however, containing smaller internal courts. Hampton Court soon became a Royal palace, and from Henry VIII. to George IV. alterations and additions were in frequent progress. Those made by Henry VIII. considerably added to its attractiveness and importance. His work consisted largely in decorating and beautifying the existing structure and in remodelling certain parts to make these suitable to the Royal requirements. He affixed the Royal Arms and added badges and heraldic devices to the buildings. Parapets and pinnacles were added, and the whole building "restored" quite in the modern manner. It was this treatment which increased the enjoyment of the archæologists, who were apt to look coldly upon the subsequent additions by Sir C. Wren, about which no mistake could be made, and where there was nothing to argue about on the score of date. Perhaps the first thing that strikes us in the earlier work of the Tudor period is, Mr. Belcher continued, the beautiful colour effects, partly due to age and atmosphere, but partly also to deliberate design. No doubt it was convenient to use local materials as far as practicable. The bricks came from Brouxham, Taplow, and other adjacent localities. Some of the stone came from quarries in Reigate, Barrington, and similar places; but Caen stone was also used where these were unsuitable. The oak was brought in large quantities from Dorking, Holmwood, Leatherhead, Banstead, Berewood, and St. John's Wood. With regard to the external effects, the beautiful texture was obtained by the inequality of the bricks, and the use of vitrified bricks in squares and lozenges. It is this which imparts to the whole that purple tone which is so admired. I am inclined to believe that Henry VIII. did not rebuild Wolsey's Hall, as has been thought; but that he merely put on a new roof or otherwise finished it. The use of chimneys, especially of shafts or terminals, was recent, and attention was drawn

* These drawings were reproduced in the BUILDING NEWS for Oct. 9, Nov. 6 and 20, 1896.

* Illustrated in the BUILDING NEWS for Aug. 16, 1897.

to this aristocratic novelty by the elaborate and varied treatment of the shafts. It is this frank treatment of a new feature or requirement which we do well to note. Its purpose is recognised, while it is used as a decorative feature. Most, if not all, of these cut brick chimney terminals have had to be rebuilt, and pipes have been introduced to make them more operative. As a picturesque feature they are so successful that they have been imitated, though not rivalled, during the Gothic revival, whereas the men of the Later Renaissance, such as Wren, discarded the separated shafts for the practical reason that by grouping or combining several flues in a square mass they gained in effectiveness. In the "Clock Court" are the entrances to the Royal apartments. Opposite to the Clock Tower is the entrance to the Queen's Great Staircase. This has been disfigured by some Gothic revivalist in the reign of George II., who has somewhat needlessly affixed the date 1732 to his work. On the south side is the entrance to the King's Great Staircase, and here we have our first taste of the Later Renaissance work. The magnificence of that colonnade in scale and proportion impresses us at once. It is the exquisite proportion, the subtle setting out of the spaces, which entrances the beholder. That trick of coupling the columns, which Wren learnt of Bernini in Paris, and which he employed at Chelsea and Greenwich Hospitals, is effectively made use of here. But instead of what is known as "Wren's favourite Dorie," just look at those Ionic caps! You must go and sketch them carefully to appreciate them. The irregular setting out of the ceiling is the only thing I have never quite liked. Standing in this court you can take in the condition and progress of architecture from Wolsey's time in 1514 to George II.'s in 1732. If at Hampton Court the transition to the Renaissance may seem sudden, we have to remember that no structural additions of any importance were made from Henry VIII.'s time until William and Mary's reign—*i.e.*, 1530 to 1690. Only in the internal fittings and decorations is there any indication of the Early Renaissance. Little was done in Elizabeth's reign, except in the garden; only a few rain-water heads have her initials on them, and these are decidedly Renaissance in character. In James I.'s reign, Inigo Jones was appointed surveyor in 1615, but I cannot discover any work of his in existence. His time was probably taken up in arranging the masques in the Great Hall for the Queen, and his imagination was exercised in wonderful architectural vistas and scenic effects. It was fortunate for William and Mary that with the occasion for additions, there was the man at hand. Wren was set to work, and fortunately for him there was no society for the preservation of ancient buildings in his time, and not being a sentimental person, and having no great sympathy for Tudor work, or for that part of it which was irregular and broken up, he did away with the irregular and inconvenient south and east fronts. Wren's plan was determined by the long canal on the east side. A centre line drawn from this to a point cutting the lines of the converging avenues would, to the mathematically-minded Wren, give the centre and building line of the new front, and this front would be at right angles with the centre line. Behind these fronts was an old court, called "Cloyster Green Court." The position of this court could not be altered by Wren in his reconstruction, and he therefore built on the old lines the new court known as Fountain Court, without reference to the centres of the new south and east fronts. The court is 116ft. 10in. on the north and south sides. The east side is 110ft. 1in., but the west is 1ft. 1in. shorter. This arises, as we may gather from the plans, in effecting a junction with the old and irregular walls. These works, commenced in 1689, were left unfinished at the death of Queen Mary in 1694, and little further was done until 1698, when the destruction of the Palace at Whitehall by fire determined the King to complete his palace at Hampton Court. From Wren's estimate for "Finishing Part of Hampton Court," dated April 28, 1699, we gather that the east and south sides were externally completed, and the upper rooms, but that the State rooms and staircases were not. But the King contemplated further extensions, and there is a plan, belonging to H.M.'s Office of Works, showing what had been a part of Wren's scheme from the first—the formation of a new and grand approach on the north side. Such new entrance was to be made commensurate with the grandeur of the new buildings then in hand. Its stateliness was to be enhanced by a 60ft. drive through the park, a mile in length. And in contrast to the straight piece of water on the east side, a circular basin of water, 400ft. in diameter, 5ft. deep, was to be formed at the palace end of the avenue, which at this point widened out so as to embrace a view of the whole palace. The chestnut avenue in Bushey Park and the Diana Basin are the only parts of this great scheme which were carried out. Like many another scheme of Wren's, it was set aside. In carrying out the work at Hampton Court, Wren was hampered for want of funds. As the work proceeded, the funds ran short, and the Portland stone he loved was not forthcoming, so that he was compelled to use Bath stone dressings in many places—for instance, in the Fountain Court windows and on the south front. The upper range of windows on the east side of the court have all been renewed in Portland stone during the last few years. Sir John Taylor, in whose excellent hands the care of the structure is now placed, is also at work on the south front. To such a strait was Wren reduced that, until a few years ago, the central part of the south front was in cement. Now it is in Portland, as originally intended. The work at Hampton Court may be said to be after the Dutch manner. It is lighter and less severe in treatment than many of Wren's other works, though without any loss of dignity or of monumental effect. Through it all, however, he has retained the English tradition. Whatever he assimilated he beautified. Mr. Maule, who has kindly lent the beautiful drawings and studies he has made of Hampton Court, has pointed out a curious, and, to me, unaccountable, difference on the east front. On the south-east angle there are twelve stone quoins, and only eleven on the north-east corner. You will see this on Wren's original elevation, so it would appear to be intentional. There are other variations. The width of the windows does not always correspond on the outside and on the inside, as you will find in the rooms at the south-east corner. They are divided into four divisions by sash-bars, but inside there are only three divisions. Here Wren sought to reconcile the need for uniformity in the exterior with that for proportion in the interior. Mr. Law severely criticises the pediment on the east front as being more or less a sham; but his opinion as to what Wren should have done I do not think will commend itself to an architect. He considers the pediment should rise above the balustrade, and stand out with only the sky as a background! No; Wren was quite right, and I might cite numerous good examples of this decorative treatment. The carving on the pediment of the east front is by Caius Gabriel Cibber, and represents "The Triumph of Hercules over Envy." The master carver was Grinling Gibbons; but he was not a figure sculptor. Grinling Gibbens is responsible for the rest of the carving, though William Emmett did some of it. Gibbons was excellent as a wood-carver; but these heads and keystones on the arches of the ground-floor windows in stone are so undercut, especially those with the initials of William and Mary in monogram, that most of the latter, at least, have had to be recarved—and, what is somewhat unusual, they have been quite as well done as the original. Beautiful as they are, however, the material has not been recognised, but has been treated as wood. There were originally metal figures above the columns on the south front; but these were removed to Windsor by George IV. Lately two figures have been sent from Windsor by the Queen to occupy what is said to have been their old position against the central piers on the south front. The stone pedestals are there, and the figures appear to fit them. They represent Hercules and Mars. These figures are found reproduced on a small scale as supporting the firedogs in one of the fireplaces of the State apartment. Mr. Law has brought to light the important fact that the ironwork of Hampton Court was designed by Jean Tijou, a Frenchman. It was carried out in England, and Huntington Shaw, who has hitherto enjoyed the sole credit, most probably worked on it. Passing through the King's Guard Chamber, we can only stop to notice the carved architraves and beautiful panelling in Norway oak, with garlands in lime-wood by Gibbons, and the large panels of excellent detail and proportions, which are characteristic of Wren's work. The chimney-pieces have bold and varying architraves. The King's rooms, which occupy the south block, lead one into the other. The Queen's apartments are on the eastern side, which is in the principal front. The Queen's Gallery is hung with tapestry, which looks remarkably clean and new. This tapestry was discovered thirty-five years ago by the present courteous superintendent at Hampton Court, Mr. W. H. Pleasants. A picture having been removed, a defect in the woodwork behind made it apparent that some material was at the back like tapestry. Mr. Pleasants reported his suspicion to Lord Mount Temple, who at once sent word that he would make an inspection of the Palace, and that some of the woodwork was to be removed. The woodwork was removed, and although dust and cobwebs abounded, the tapestry was in good order, and, after a good brushing, it looks now as fresh as ever. It may have been covered up by Queen Caroline in 1735, for in Hervey's memoirs it is stated that she (the Queen) was very fond of pictures, and brought a number from Kensington Palace. The private rooms are interesting. The private chapel, being without external windows, is lighted by a pretty dome. The public dining-rooms, the Queen's private rooms in the rear, and the Presence Chamber and Guard Chamber were only finished in the reign of George II. The details of the large rooms are rather coarse and lacking the refinement which is to be found in Wren's work. Mr. Law demonstrates that it is the work of Kent. If we draw a centre line through the Chapel, pew, and Great Hall, we can see that they have been planned in relation to each other. Unless Henry VIII. destroyed Wolsey's Chapel, &c., as well as the Great Hall, this is additional evidence that the Hall was not enlarged by him. The Chapel was refitted and altered by Wren, and its carving by Gibbons and inlaid wood reredos reminds us of Trinity Chapel, Oxford. The kitchens are well worth a visit. Notice the double arches over the chimney openings, the single keystone serving for the relieving arch as well as the stone arch under with its joggle joints. In conclusion, Mr. Belcher observed: In Hampton Court the student has a great storehouse of architectural treasures. Let me advise you to make separate studies of the chimney-pieces, the fire-backs, and fire-dogs, the old furniture, consisting of bedsteads, chairs, curtains, and needlework, old card-tables, and a perfect collection of silvered looking-glasses and old china. Then there is the ironwork, wrought and cast, which is a subject worthy of special notice. And, further, the gardens, with their inclosing walls, piers, gates, steps, and terraces, might form the subjects of many papers. All these treasures are so accessible, and sketching orders so easily obtained, that Hampton Court should long remain a prolific mine to the student.

A short discussion followed, in which Messrs. Ernest Law, H. H. Statham, W. H. Seth-Smith, Percy Hunter, and the President took part, and a vote of thanks was accorded Mr. Belcher.

SURVEYORS AS ARBITRATORS.

At the ordinary general meeting of the Surveyors' Institution held on Monday evening last, the discussion was resumed on Mr. A. A. Hudson's paper, read at the last meeting, and bearing the above title (see our issue of the 28th ult., p. 123), by Mr. P. E. Pilditch, who thought that Mr. Hudson might well have extended the title of his paper, for there were many cases other than building ones which came before surveyors as arbitrators; for instance, that large class of cases in which the valuation of property other than buildings was concerned. Under the Building Act there arose a class of cases in connection with party-wall disputes, for which a very simple procedure was laid down, and one which answered, he thought, all the four requirements which Mr. Hudson had mentioned as prominent in the minds of litigants. A surveyor acted on each side, and a third was nominated to settle any differences between them which might arise. The were also the large number of cases to which Mr. Hudson in his modesty had not referred) which were simply, economically, and satisfactorily settled by the Tribunal of Appeal created by the Act of 1891. The scale of costs authorised by the Tribunal were certainly most moderate, and cases coming before it need not, unless the litigants chose to employ counsel and solicitors, involve any very great expense. Four *desiderata* were laid down by the author as those to which litigants attached importance.

They were, briefly: An intelligent understanding of their case by the Tribunal trying it; next, strict legal rights, then prompt hearing, and, lastly, economy. Bearing in mind these points, it seemed that a building case could best be settled by an arbitration before a surveyor who was also an architect.

Mr. T. Rickman said he could hardly agree with the author's view of the question under discussion. He thought he had hardly laid sufficient stress on the importance of an arbitrator having the fullest possible opportunity of inspecting the work, and the necessity that the Court should sit within a reasonable distance of the building which was the matter of arbitration. He was not quite sure whether the author had made it clear that the R.I.B.A. conditions stipulated that the arbitrator to be nominated by the president should be a Fellow (and not merely a member) of that body. The arguments in favour of the architect of a building being the sole arbitrator in case of dispute arising were cogent, although there were cases in which an independent arbitrator should be a man accustomed to act for one side or the other in the matter of a contract; but building surveyors were so used to acting sometimes for one party and sometimes for the other, that he thought they might well be relied on to judge fairly in any dispute submitted to them. He did not think it quite fair that where, by the terms of a contract, certain matters were left to the decision of an arbitrator, the owner should have power to nominate him after the dispute arose. The arbitrator's name should be inserted in the contract before it was signed. With reference to accounts, in the old days, when a builder made out his own estimates, it was his business to make out his own costs; but the quantities were now almost invariably supplied to the builder, who tendered for each item at a particular price, and added the quantity surveyor's fees. Where there had been omissions and substituted extras, the charge for valuing them should be added to the amount in fairness to the contractor. A Technical Court such as had been proposed would, he imagined, have to decide cases of dispute as to the value of work done, and of intermixed property and party-walls. The London Building Act of 1894 had rendered the settlement of some of these matters much easier; but in the country there was still much difficulty in deciding them. How the ideal court should be constituted he was not sure, or what should be its powers of inspection or of calling evidence. His own view was that in building disputes the building itself was the principal witness, and parole evidence was only useful to explain the circumstances.

Mr. H. Northcroft was of opinion that it did not so much matter whether an arbitrator were a surveyor or an architect, so long as he was a strong man, and well acquainted with the technical matters in dispute. He supposed that three-fourths of the building disputes in the country came before arbitrators for decision; but the remaining fourth kept the Courts well supplied with business. A trial of a professional case before a judge was, to a professional man, a hopeless matter. Everyone concerned was ignorant, in the nature of things, of the technical details, and the result often depended on a mere side issue. Every surveyor who had experience of technical cases before the Courts would heartily agree with Mr. Hudson's proposal for the establishment of a professional tribunal, which should, he thought, not confine its jurisdiction to London, where the Building Act fairly provided for such matters, but should take cognisance of building disputes throughout the country.

Mr. A. Vernon said he did not know of any tribunal which had more satisfactory methods of settling points of law and of fact than the High Court; but, in dealing with technical matters, the judges were necessarily at a disadvantage. There could not be insuperable difficulties in the way of establishing a satisfactory system of arbitration in professional cases. The question of costs had been mentioned, and it was possible that these were often not much more satisfactory in an arbitration case than if the matter had been before the Courts.

Mr. W. H. Strudwick said he thought that for the settlement of building questions the mode at present in vogue was as satisfactory as any that could be suggested, and he quite agreed that a surveyor who, in the course of his ordinary business, was accustomed to act first on one side and then on another, was the most suitable person to select for an umpire.

Mr. C. J. Mann said that, while he agreed that an umpire might attach weight to the evidence of witnesses in proportion to what he knew of their experience and practice, he believed that every umpire would most carefully consider the facts as stated in evidence as the true basis of his decision. If, as he understood Mr. Hudson to say, the only power which the High Court had in cases involving accounts was to refer the action to an official referee; the matter was on a rather unsatisfactory basis. It would seem to be much better that the Court should be able to refer to an arbitrator or a technical tribunal. He was afraid that cases were now very often decided on a side issue; witnesses finding it very difficult to bring out important points when once the referee and counsel on both sides had got hold of what seemed to them a test point. He, of course, spoke with all respect. If an arbitrator could be named in a contract before it was signed, many disputes would be settled.

Mr. H. T. Steward said that no doubt the best way of settling building disputes was to bring them before a professional man as arbitrator—whether with or without counsel must depend on the nature of each case. In disputes under contracts with the Office of Works it was specially agreed that there should be no counsel employed in the arbitration. Of course, if points of law arose, it was advisable that counsel should appear. He was sorry to say that he must endorse the statement that counsel did sometimes add to the time occupied in an arbitration. He, when acting as arbitrator, rather preferred to have counsel present, for they were in the habit of arguing points without developing any undue heat, which the litigants themselves were not always capable of doing. He was pleased to notice, in many contracts with which he had to do, that the president of that institution was appointed to nominate an umpire in case of dispute.

Mr. Arnold Statham said that one of the difficulties to be faced by surveyors acting as arbitrators was that they had often been employed in other cases by one party or the other to the dispute brought before them to arbitrate upon; but he was glad to believe that in such cases they did their utmost to preserve an unbiassed mind, and he was sure that no member would accept a reference where there could be any suggestion of doubt as to his impartiality. Mr. Statham went on to quote a case where an umpire, acting for a railway company in one case, was held not to be biassed in deciding another case to which the same company was a party ("Haigh *v.* L.N.W.R.," 1896, 1 Q.B.) As to quantity surveyors, they were generally valuers, and the distinction between a valuer and an arbitrator could not be too clearly accentuated. As to allowing assistance to either side in a reference, it was generally better for the arbitrator to allow than to exclude any assistance that might be material. Such assistance had been held by the High Court to be allowable.

Mr. Hudson having replied on the whole discussion, and thanked the members for the patient way in which they had listened to his paper and the friendly criticisms which they had passed upon it, the chairman (Mr. Robert Vigers, vice-president) briefly summed up the discussion, and the meeting then adjourned.

THE SURVEYORS' INSTITUTION ANNUAL DINNER.

THE dinner of this admirable society was an unqualified success on Wednesday evening last, at the King's Hall, Holborn. Mr. Christopher Oakley, the able and ever-courteous President, was fittingly supported by the Earl of Jersey, Sir Richard Webster, the Attorney-General; Mr. Jesse Collings, M.P.; Judge Meadows White, Q.C.; Sir John Wolfe Barry, President of the Institute of Civil Engineers; Sir I. F. L. Rolleston, Mr. R. Vigers, Sir Ernest Clarke, Sir A. R. Binnie, Mr. A. Chancellor, the Mayor of Richmond, and many others well known in the legal, architectural, and surveying professions. The Royal Institute of British Architects was not, however, officially represented, and the President, Mr. George Aitchison, R.A., himself a leading district surveyor, was conspicuous by his absence. The following particulars were incorporated in the speech of Mr. Wheeler, Q.C., who proposed the toast of the evening, "Success to the Surveyors' Institution":—The institution was founded in 1868, and incorporated by Royal Charter in 1881. The first ordinary general meeting of the institution was held in November, 1868. The society then numbered 150 Members and Associates. It now numbers about 3,000 of all classes, representing a growth from 150 to 3,000 in 30 years. In 1868 two gentlemen shared between them the honours of the students' class, and Mr. Wheeler stated that he himself was one of those two. There are now nearly 300 students on the roll. From the numerical standpoint the institution now occupies the second place among professional societies, omitting, of course, from this comparison those ancient corporations, the Law societies and the two branches of the medical profession. In the same 30 years the institution has endowed the profession with a literature comprising some 40 substantial volumes. It has introduced a system of professional examinations of a most practical character carefully adapted to the requirements of the various branches of the profession, and has actually examined 3,228 candidates in the last 16 years. It has accumulated funds sufficient for the construction of a handsome building, now in course of erection in Great George-street, at a cost of some £30,000, from designs by Mr. Alfred Waterhouse, R.A. The Institution has a large branch in Ireland, comprising all the leading land agents in that country, and another branch in Scotland. It possesses a valuable library of about 8,000 volumes, and various collections, including a forestry museum, for which ample accommodation will be provided in the new building, which was illustrated in the Building News for Jan. 1 and June 4, 1897.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—XVI.

By an Assoc. Inst. Elect. Engs.

WIRING (*continued*).

THE *Cleat System*.—In this system the conductors are supported by means of hardwood *cleats*, grooved, as shown in Fig. 44 I,

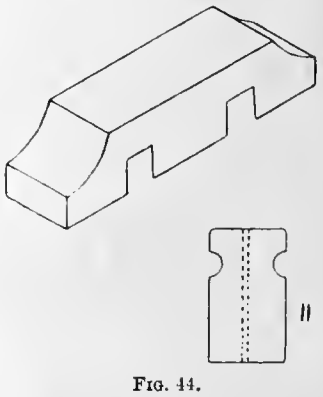


Fig. 44.

varying in length from 1½in. to 6in., and from ½in. to ¾in. in width, according to the conductors supported. These cleats are fastened to the walls or ceilings by means of a screw passing through the centre of the cleat. The cleats are placed about 1ft. apart at a high level, and in running the circuits it is customary to strain the conductors like telegraph wires; and since the size of the grooves are such as will grip the conductor when the cleats are screwed up, there is no difficulty in keeping the wires stretched and in producing a neat appearance.

This system is more especially adaptable for temporary work, and for factories and workshops, although it is not recommended for permanent work in any case, as it is deficient in mechanical protection. As an example of open work it is inferior to the method shown in Fig. 44 II, in which a wire is shown secured from the wall by means of porcelain knobs or cleats. In some "fire rules" in which the cleat system is allowed, the rules state "that the continuous and permanent separation of the + and − conductors from each other must be secured by a space of at least 2in., and from walls or the like by a space of at least ½in., or by a porcelain or wood backing at least ½in. thick."

Damp-proof, Fireproof, and Impenetrable Tubes Systems.—The third system of supporting conductors includes a number of special systems, two of which demand more than passing notice, both on account of their specific characteristics and

the advance they make in the quality of the protection and insulation introduced. The first which we shall consider is known as the *conduit system*—has already been largely adopted in America and in Germany. This method of wiring originated with Mr. E. H. Johnson, who was connected with the Edison Companies of America, and consists essentially of a tube of insulating material through which the cables are afterwards drawn, and which displaces the

FIG. 45.

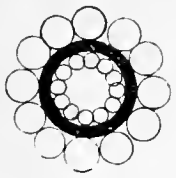

FIG. 46.

wooden casing. A variety of materials have been used for making the tubes; but we shall only refer to those introduced by the Interior Conduit Company. The insulating material employed is a specially prepared hydrocarbon of the bitumen class. The necessary strength in tube form is obtained by using a peculiar grade of fireproof paper material which admits of impregnation. The result is that these tubes are very light, easily manipulated, smooth, damp-proof, fireproof, and very tough. This type is known as *plain* tubing, and there are two other varieties, the brass-covered and iron-armoured. These coverings give additional mechanical strength, and render them more impenetrable. In each of the three types the tubes are made in 10ft. lengths, and suitable couplings and junction-boxes have been designed for rendering the system as perfect as possible. The method of drawing the wires in is simple and interesting. "The wires or cords for drawing them in when required are drawn in by a fishing wire consisting of a narrow band of steel about 60ft. long, with brass balls at the ends, the interior of the tubes being lubricated by blowing in powdered soapstone. It is found that this lubrication, combined with the smoothness of the tube, affords complete immunity from the abrasion to which insulated wires are liable on being drawn into ordinary iron piping." A section of an insulated steel tube is shown in Fig. 45.

In connection with the use of iron pipes without interior insulation, it may be remarked that the tendency to rust inside tends to diminish the insulation of the cables, and that burrs and other internal roughnesses may cause serious mechanical damage to the insulating material as the wires are being drawn in. The following are the essential advantages claimed for the conduit system of wiring:—

Durability.—The insulating lining, being a non-conductor of heat, prevents any temperature changes from promoting internal condensation within, and deterioration of, the steel pipe. It preserves also the insulated conductors contained within the pipe, under the least changeable conditions, and is, therefore, conducive to their greatly-increased durability.

Safety.—The insulating lining provides smooth cushioning interior surface, which will not abrade the insulating covering on the conductors, and resisting the effect of an internal "arc," prevents danger from fire risk due to any "short-circuiting" or "fusion" of the conducting wires. The lining proves more trustworthy than "fuses," and provides a "safety factor" which no method of testing can insure. Also the insulating properties of these tubes is such as to provide (approximately) an additional "300 megohms per mile" insulation resistance to the wire. The bituminous material used in the insulating tubes is inert in its nature, and exercises no deleterious influence on the insulating material of the wires themselves.

Convenience.—The waterproof insulating lining being "steel-armoured," cannot be damaged, and therefore guarantees a certain standard of insulation resistance under all accidents of material or workmanship. The insulating conduit method of wiring provides a system of electrical installation analogous to that of gas or water, and checkmates the ignorance or carelessness of unskilled workmen.

Accessibility.—The insulating lining gives a smooth, frictionless surface, over which conductors can be easily drawn, and thus makes possible any alteration or extension without fear of mutilating valuable decorations. A lined conduit can be guaranteed free from the internal "fins" and "burrs" incident to plain pipe-work, both before and after erection.

Economy. — Steel-armoured insulating-lined conduit provides absolute protection for the conductors, mechanical and electrical; immunity from fire risks; convenience for alteration and extension; and doubles the life, whilst greatly

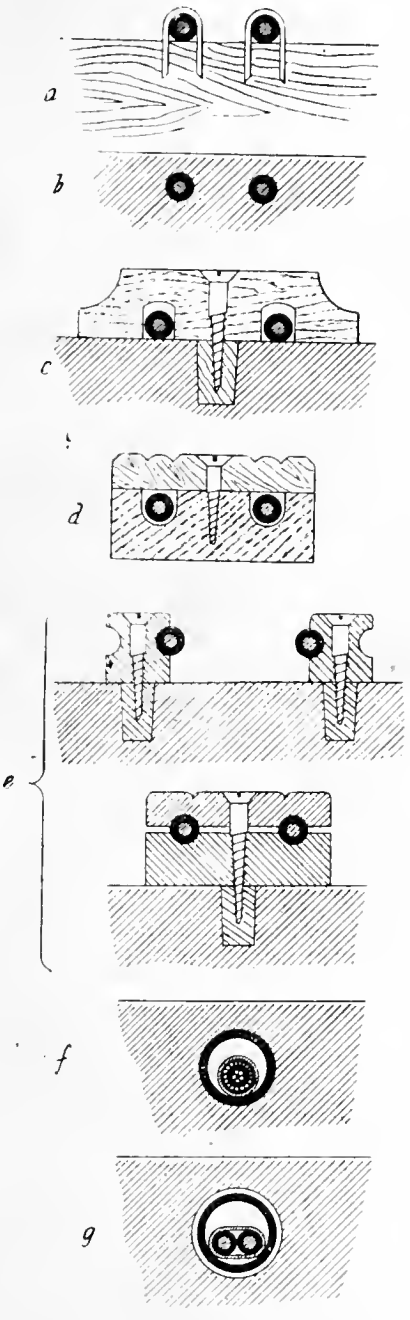

FIG. 47.

increasing the efficiency of, the lighting system, with an increased cost of but 5 per cent. upon the total expenditure for complete installation.

The second system to which we must refer is that known as *concentric wiring*. Several varieties of this system have been introduced by different inventors; but we shall only deal with general principles. In this system of wiring a central conductor or strand of wires is thoroughly insulated by vulcanised indiarubber, which is everywhere surrounded by an uninsulated outer conductor or metallic sheathing of conductivity equal to or greater than that of the core. The inner conductor consists of copper wire or wires, whilst the outer, which has a much larger area than the inner, consists of galvanised iron wires, and forms the armouring of the cable. As in the conduit system, no casing is used, the armoured cable being laid directly in the plaster, so that the outer conductor forming the return wire is completely earthed, and it is therefore evident that, by earthing this conductor, it is always at zero potential—i.e., earth potential—and there cannot be any risk whatever of shock or spark being experienced from it. A section of this cable is shown in Fig. 46, and as there is only one vulnerable conductor—and this, with its insulation, being incased throughout its entire length in the metallic sheathing formed by the outer conductor—it is well protected against injury.

In the case of the concentric conductor, if it should be crushed, or a nail be driven into it, the instantaneous result is a dead short-circuit, and the melting of the fuse. If the insulation should be punctured and moisture gain access, the distance across the insulation between the conductors is so small that the fault immediately develops into a short-circuit, and the spark passes from the centre conductor to the inner surface of the metallic sheathing, and being entirely within the sheathing, it cannot communicate fire to its surroundings. Concentric conductors are thus self-testing. Faults cannot endure. They cut themselves out automatically. Probably the most conspicuous advantage of concentric wiring is that it may be so easily and so effectually made waterproof. The cables may be inclosed in lead sheathing, laid under or over the outer conductor, and hermetically sealed to the various apparatus into which the cables are led. As this is a special system of wiring, special fittings and junction boxes have been designed. Whenever a joint is to be made, or the cable led into a switch or fitting base, the centre wire is soldered to its contacts, and the outer conductor and its lead sheathing are received and terminate in a jointing pocket cast upon the switch-box or junction. The central wire and its insulation are thus inclosed throughout their length in a hermetically-sealed metallic sheathing. The switches and fuses should be in the central wire and inclosed in the metal case.

As a means of showing the different systems of wiring, we give in Fig. 47, examples of the following:—

(*a*) Wires secured on the surface by metal staples.
(*b*) Wires directly imbedded in plaster.
(*c*) Wires secured on surface by wood cleats.
(*d*) Wires secured on surface within wood casings.
(*e*) Wires secured on surface by means of porcelain knobs or cleats.
(*f*) Conduit-wiring beneath surface with twin (concentric) conductors.
(*g*) Armoured conduit wiring beneath surface with twin (parallel) conductors.

We may now compare wood-casing with the newer and special systems. Wood-casing no doubt owes its extensive use to two desirable attributes—*ease with which it is installed* and *accessibility* (when not concealed). Compared with the newer systems of protecting cables, it is cheap, and lends itself fairly well for surface work. At the same time, the cost of labour in fixing the cables is greater, and as a mechanical protection for the wires it is imperfect; and it is as deficient in insulating protection, because it is neither fireproof nor damp-proof. It also expands, contracts, and warps, and may possibly cause the plaster to crack, and it is altogether unsuitable for use in damp places.

Fittings.—As an introduction to that part of our subject termed "fittings," we give here the good and bad points of some of the chief materials used as insulators. The bases and supports for switches and other fittings should possess high insulation properties, and it is essential that they should be non-combustible, not readily breakable, nor affected by atmospheric changes. Wood, porcelain, slate, marble, and red vulcanised fibre possess the following properties:—

Wood is easily worked, but is soon affected by moisture, and is liable to expand, contract, or warp. It is also combustible and readily chars, unless covered with some uninflammable substance, in which case it may be used for the bases of cut-outs, although it is not recommended in any case. It is a fairly good insulator when thoroughly dry.

Porcelain is an excellent substance for bases, and is a thoroughly good insulator. It is, however, brittle, and if subjected to much strain is easily broken; consequently care is required in fixing porcelain bases. It is non-combustible.

Slate is a very good insulating substance, and is tougher than porcelain. Unless varnished, it is liable to absorb moisture, which diminishes its insulating qualities. It is non-combustible.

Marble is an excellent insulating substance and is tougher than slate, and is not liable to be affected by moisture. It is non-combustible.

Red vulcanised fibre is a very good insulating substance, and is specially adapted for insulating handles, being easily worked, mechanically strong, and tougher than wood. It is not brittle, and, although charred by fire, it is not inflammable, and, if varnished, is not affected by moisture. Its insulating qualities are somewhat diminished if subjected to variations of temperature.

STABLE FITTINGS.

Messrs. Hayward Brothers and Eckstein, Limited, of Union-street, Borough, London, S.E., have published a new catalogue of stable and cow-house fittings. The old-established "Cottams" fittings, so favourably known to stable-builders and architects, now made by this firm, have been supplemented by the addition of many improved patterns which experience has suggested. In looking through the illustrated catalogue on our desk, we notice several of these improved fittings. Some practical hints are given on the planning of stables, and suggestive plans for fittings are shown well worth the architect's attention. The cubic space per horse is given as 1,500ft., and the height should not be less than 12ft.; stalls 6ft. wide, and 9ft. or 9ft. 6in. from wall to outside of post. Loose-boxes should be about 12ft. by 10ft., with doors opening outwards. The stall divisions show a space below bottom rail for ventilation, with straight and curved ramp-rails. The stall division, for converting loose-box into two stalls, is a good arrangement. Several patterns of ventilating ramps of wrought-iron bars are illustrated. These have cast-iron heel-post 10ft. high, iron halter rings, guard-bar, bottom sill with shifting piece. The woodwork is 1¾in. to 2in., and the prices are moderate, and suit every stable. The loose-boxes illustrated show many improvements. We note a capital arrangement for ventilating stalls and loose-boxes by a patent ventilating iron sill, perforated, with the top flange formed with a groove for receiving the woodwork of division. Several pages are devoted to self-fixing cast-iron bases for heel-posts and manger sets. The new safety manger fittings of Messrs. Hayward Brothers and Eckstein are excellent: they avoid all sharp angles, the top plate is "barrel-fronted," there is a manger-pot, tip-up gruel-pot, hay-rack, patent silent tying apparatus, &c. We advise the profession to take note of these improved mangers and fittings which this company have introduced into the stables of Lord Dudley, Messrs. Maple and Co., Ltd., J. Andrews, and others. We recommend our readers to send for the catalogue.

A COAT OF PAINT.

A coat of paint is an object familiar to all of us; but how few—even those persons who lay on a "coat" of paint—know much about the constitution or composition of such coat. Painters all their lives may have been laying on coats of paint on all sorts of materials, which have been subjected to all kinds of influences—heat, cold (internal and external), air, &c.; but, although the process of producing the "coat" is practically the same in all cases, the conditions of permanency, durability, or wearing qualities are materially affected by the conditions under which the paint is laid on, and by the nature of the material overlaid with such paint. In this and subsequent articles it is the writer's intention to expose the reactions that occur in a coat of paint. In a former article the vagaries of a paint were laid bare as regards the phenomenon technically known as the "sinking-in" of colours; in that article the chemical reactions producing this optical effect was given and advice also for the prevention of same. In the present article it is the writer's intention to consider the nature and cause of

BLISTERING OF A PAINT.

And in subsequent articles to consider the cause of peeling, cracking, wearing away, &c., of a coat of paint. The primary operations are best detailed, so that a clear conception of what is to follow will be obtained. These preliminary operations will, in a great measure, be controlled by the quality of the painting to be done. For the purpose of our present paper we will consider the question of painting a superior job on wood, one which has to be painted to perfection. The quality of the finished work depends on the preparatory work of laying on the priming coat. The first operation should consist in rubbing down the rough places in the wood by means of sand or glass-paper wrapped round a block of wood. For the moulding, a stick can be used, or the sandpaper rolled into a cylindrical form.

After smoothing the surface of the wood, carefully inspect it and remove all traces of resinous or gummy matter that exudes from the knots or cracks in the wood. If a long slit-like crack shows itself in the wood, scoop or scrape out any resinous matter and carefully fill in same with hard putty. It will be noticed that the knots are apparently full of resinous matter. This matter cannot be forced out of the knot, and although what is on the surface may be removed, that which is retained in the fibre by the knots will eventually come to the surface by the contortions caused by alterations of temperature to which the wood will be subjected, and as a consequence these later exudations of resinous matter will dislodge the paint that is laid over them, and either cause the paint to remain soft and sticky, or else cause it to peel off. Now the usual method to prevent disaster of this kind in the future is to lay over these knots a compound called "knotting." These knotting compounds usually consist of shellac varnish for best quality work (*vide infra*, for formula for preparing these knotting compounds), white or bleached shellac being used for wood that is to be painted in light colours or varnished, and orange or ruby (sometimes called black shellac) used for wood that is to be painted dark. In any case, the writer has found that the knotting will, in course of time, show itself in some undesirable form, either by causing the paint over it to shrink or shrivel up, exposing wide cracks or fissures in the paint, or else causing a discoloration in the paint or varnish itself by reason of the confined resinous matter in the paint, in its endeavours to exude from the surface of the paint, causing chemical and physical reactions with the knotting compound. Now the writer, from what attention he has given to this subject, has found that it is far better to extract all possible quantities of the resinous matter before laying on the knotting compound, than it is to imprison the resinous matter under a hard, unyielding, but brittle, coat of shellac. The resinous matter may be extracted by brushing the parts over with benzine repeatedly, or sulphuric ether; these fluids will penetrate the fibre of the knot and combine with the resinous matter contained therein, and by diluting the gummy matter allow it to come to the surface freely, and thus easily removed. The operation takes some little time; but by repeated application of these solvents all the free resinous matter may be removed, and then, when the "knotting" is laid over the knot, it will be on a hard solid surface, from which no exudation in future will occur. Another substance that will combine with the confined resinous matter is a strong solution of caustic soda, which will form a resinate (*i.e.*, resin soap) in the fibre of the knot, whereby the soft expanding resinous matter becomes converted into a solid, hard-drying body, which will not exude in the future. Formula for knotty compounds:—

No. 1.—Ingredients: 1 gallon of methylated spirit, 24oz. of amber resin powder, 56oz. of shellac.

No. 2.—Ingredients: (*a*) 8½oz. of shellac, 30 fluid ounces of methylated spirit, 1 fluid ounce of water. Mix the spirit and water, after having dissolved the shellac in the spirit.

(*b*) Ingredients: 32oz. of Kauri copal powder, 3oz. of methylated spirit, 1oz. of turpentine. Dissolve by slow digestion.

For use, mix 3 parts of *b* with 1 part of *a*[1]. After covering over the knots in the wood, the next step is to putty up all holes and cracks. If the painting is to done in two coats only, the putty used should be composed of common whiting and white lead ground in oil, the mixture being prepared of the right consistency. To putty up nail-heads, it is best to apply the putty after laying on the first coat. If the painting is to be done in three coats, the putty used should be composed of linseed-oil and whiting—i.e., pure linseed-oil putty, and the puttying should be done between laying on first and second coats. After allowing for the knotting to dry, the next step is to lay on the priming coat: this is generally white lead which has been just tinged with red lead to give the priming coat a pink hue. This priming coat is always laid on very thin (it is mixed of almost a fluid consistence), and after laying it on, the puttying is done. Instead of a pure white or a pink being used for a priming coat, it is better to tinge the colour of this coat with the same colour pigment as the finishing coat is to be. Thus, if green is to be the colour of the finished coat of paint, a small quantity of some green pigment should be mixed with the white-lead used in the priming coat, and it is a good practice to make the early coats darker than what the finished coat of paint is to be. This will give a solid appearance or "good-quality" finish to the painted surface. Where the coat of paint consists of three or four layers of paint, it is not an infrequent practice to colour the first or second one a slate grey by mixing lampblack with the white-lead. It is, however, better to use each coat of above similar to what the finishing one is to be. If by any means the previously laid-on coats become greasy, smoke-begrimed, or otherwise soiled, it should be sponged over with turpentine. This will remove the grease, and is better than soap, potash, or soda-and-water. These last bodies will remove the grease; but they will also partially unite with the oil in the paint, and convert some into a soap. Such soap will show itself by making the surface of the coat of paint slippery, and as a consequence the next coat of paint will not firmly adhere or combine with the previous one. Of course, in the case of repainting old work, this does not apply, as the oil in the old paint has become so hardened as to be unacted on by the alkali, and then soft soap or soda is the best body to use for cutting and removing the grease. The proportions of the ingredients of each part vary according to the nature of the pigment to be used. This is necessary because the chemical composition of pigments are very diverse, some being sulphides, others oxides, others carbonates, &c., and although oxides as a rule require less oil vehicle than most other pigments, yet the nature of even those of the same chemical classes are so different that no general hard-and-fast rule can be laid down for the proportions of oil and pigment when mixing into a paint. Thus, oxide of zinc is a very light amorphous powder, while oxide of lead is a very dense heavy one; and while the latter pigment readily combines with the oil used in grinding it up into a paint to form a homogeneous compound, yet excessive grinding of zinc oxide and oil will not cause them to combine in the manner lead oxide does. In small shops it would not pay to grind up one's own colours into paint, except by the aid of a hand-mill: but in large concerns, where an enormous amount of paint is used weekly, it would pay to do so, as then the user of the paint would be able to guard against fraudulent adulteration. The actual process of grinding up the dry pigment in the oil vehicle is done by first roughly mixing the pigment with sufficient oil to form it into a stiff paste or dough, and then put this through the mill with the remainder of the oil. The compound will require to be put through more than once—until, in fact, it is of the desired workable consistency.

The superficial area covered by any paint will depend on the nature of the paint, as some colours spread over a larger area than others when taken weight for weight, or bulk for bulk. In the following tables are given the approximate amount of each ingredient for compounding paint for first, second, third, and fourth coats to cover 100sq.yds.

In addition to these, there will be required for the same area 5lb. of putty, 2½lb. of white-lead, and for exterior work exposed to the atmosphere, where only two coats of paint are required, 1 pint of turpentine and 4 pints of boiled oil should be given on both coats in excess of what is named in the table. When the paint is required to dry quickly, more turpentine than stated is required in all the coats. It should be mentioned that the estimated quantities in the table below are for freshly worked up pine; on other materials the superficial area might be larger or smaller, according to its roughness, porosity, &c. The area covered also depends on the state of the

[1] The above is known as patent putty. The older form of such compound was composed of red-lead, litharge, and boiled oil or spirits of turpentine.

weather when the paint is being laid on, whether warm or cold, wet or dry, or hot.

No. 1. For interior work not flatted. Priming coat: Red-lead, ½lb.; white-lead, 16lb.; driers, ¼lb.; raw linseed oil, 6 pints. (More red-lead and less driers may be used.)

Second coat: White-lead, 15lb.; driers, ¼lb.; raw linseed oil, 3½ pints; turpentine, 1½ pint.

Third coat: White-lead, 13lb.; driers, ¼lb.; raw linseed oil, 2½ pints; turpentine, 1½ pint.

Fourth coat: White-lead, 13lb.; driers, ¼lb.; raw linseed oil, 2½ pints; turpentine, 1½ pint.

The priming coat for walnut or dark colours is best prepared by using a mixture of Venetian red and lampblack ground up in boiled oil, and the compound used very thin, so as to stain, rather than paint, the wood. For mahogany, a priming of a paint composed of red ochre, stained with a little red-lead, may be used, while for oak, maple, and other light colours yellow ochre should be used. The object of using a dark priming, or one which is similar to the finished colour, is to avoid showing a white surface beneath the paint should it be scratched, chipped, or cracked.

After the priming coat is laid on and dry, fill up all indentations, nail-head holes, &c., with pure linseed-oil putty, and then smooth the surface by rubbing with fine sandpaper. This rubbing should be carried out with each coat when dry enough, before proceeding to lay on the next one. After the second coat is dry, inspect the work to see if there are any soft parts under the knotty compound. The third coat should not be put on until the second one is sufficiently dry, and the same remark applies to the fourth coat, and the last or finishing coat should not be at all sott or tacky if it is to be varnished. The varnishing should never be done in a moist or damp atmosphere, neither should a draught of cold air strike the varnish after laying it on, for if it does, the resins in the varnish will be more or less deposited, and show their presence by imparting a bloom or milky appearance to the varnish, or, or, in technical language, the varnish becomes chilled. H. C. STANDAGE.

(To be concluded.)

The Stonehaven Harbour Board are contemplating making a considerable extension of the harbour area. The Loan Commissioners have offered to advance £13,000 on comparatively easy terms.

The docks committee of the Bristol Corporation have appointed Mr. Thomas A. Pearce, M.Sc., as chief assistant to the docks engineer, at a salary of £400 a year, and have raised the salary of Mr. H. C. Parkinson, mechanical engineering assistant engineer, from £250 to £300 a year.

"BUILDING NEWS" DESIGNING CLUB.

A SMALL PUBLIC LIBRARY.

THE Christmas holidays seem to have interfered with the work of the members of our Designing Club, unless it be that the problem of designing a Public Library on outline instructions proved too great a task for some of our usual contributors, seeing that some of the best of them are conspicuous by their absence on this occasion. We intentionally left the competition particulars somewhat vague as to the relative sizes and location of the several rooms, because it seemed to us best to give a wider scope to the designers, and, moreover, it appeared desirable in their own interest that they should study up the subject for themselves, and not always be fettered by too many leading-strings.

It cannot be said that any of the designs realise a model type to be followed. We did not expect the plans would do se, and we admit the apparent tiresemeness of criticism which sometimes is taken to be little better than fault-finding. If, however, we do find fault, our intention is not limited by any such narrowness of idea. Indeed, we wish to help the members to improve, and we always heartily welcome, therefore, any good points in their work. "Centaur," on the whole, is the best. "By Go" comes second; and the third position is taken by "Maggot," though we do not consider his design calls for illustration. The following are the conditions, which ought to be read somewhat carefully in judging as to how far the competitors have carried out the scheme therein indicated. Where a lead was necessary it was given, though such aids were by no means always acted upon.

"Third List of Subjects.—C. A Small Public Library for a suburban district, the site being a corner one in a main thoroughfare, with a frontage of 110ft. and a depth of 80ft. The return road is on the left-hand side of the frontage which faces north, and main façade is to be set back 5ft. A porch or bays may project. No rights of light can be obtained on the right hand of the site. The accommodation required is to comprise a large newsroom, a magazine room, a reference room, and a lending library, all on the ground floor. A ladies' room and a boys' room, as may be contrived, and a librarian's room is necessary. Upstairs, a flat for his accommodation is to be provided, befitting an educated man with a limited income and small family. A filing space and workroom for the staff is necessary, and in the basement a heating-chamber, and lavatory, &c., for staff. The problem is to properly appropriate the relative sizes ordinarily required for the respective departments in a library of this class, remembering that ample counter-space for the lending library is essential. Style left to the taste of designer. Cost, £5,000. Materials, red brick and stone. Scale, 8ft. to the inch for elevations and sections. Plans, 16ft. to the inch. A sketch view wanted."

"Centaur" is the best; but there is an absence of central control which in a small library such as this is a great fault, making extra supervision absolutely necessary. The librarian is too publicly placed, for he is not a janitor, and needs quiet to do his work, much of which is of a clerical kind. The borrowers' counter is too restricted and confined, and the attendants are needlessly shut off from the rest of the public rooms, which do not include a boys' room on the ground-floor room. The public w.c.'s are not wanted, and are best left out, particularly in conjunction with a ladies' room. The contrivance of the plan is ingenious and well thought out; but there is a want of connection between the parts. The boys' room upstairs isolated from control would never do, and the author does not seem to have thought at all about the need of supplying boy readers with books. A big staircase is contrived to lead up practically to this one room, and the lifts shown from the book-store in the basement do not rise higher than the ground floor. The filing room and mending room are cut off too much from the public rooms, as well as stack rooms, to make a convenient arrangement. The librarian's house is situated on the first floor, as required, with a separate entrance up the return-street, and he has a garden too. The provisions are ample; but the scullery difficulty has not been overcome, neither do we like the top light for the servants' bedroom, or the long dark corridor connecting the landing with what is called the hall. Externally, the building is not very attractive, though it is well defined and not unsuitable in style. Anyway, it is the most satisfactory of those before us. The author has done his best thoroughly, and undoubtedly deserves no little commendation.

"By Ge" has made a more compact type of plan, and his scheme is much more to the purpose taken as a whole. The officials are in the centre of things. The great defect is the shortness of counter-space, and the small area in front of it; the borrowers' hall is all doors and windows and no room to move. Fancy several persons waiting at the counter and several others going in and out of the news-room. Nothing could be more inconvenient, not to mention the additional traffic in progress to the other rooms, all leading out of this circumscribed hall. The reference room, instead of occupying the most retired position available, is thrust to the front, overlooking the main thoroughfare, and the news-room, where the larger number of casual readers assemble to look at the papers, instead of being situate close to the entrance, is put at the back of the block. The librarian's house, which was specified to take the form of a flat on the first floor, is made an adjunct, and hardly carries out our intention. It is much more difficult to plan a house as "Centaur" has done than to make a separate tenement such as "By Go" has shown. The elevation is poor, and suggests a regulation Post-office sorting department rather than a suburban public library.

"Maggot's" plan is very compact, but the arrangement is disjointed, with parts out of proportion in area. The elevation shows ability, though the external façade does not emphasise as it should do the interior requirements. The librarian's rooms, lighted by big dormers, would not be very comfortable apartments. The central hall is too small, and the counter is not long enough. The boys' room is cut off from the library books department, and the reference-room is not in a quiet position as it should be.

"Gossip" does not do himself justice. He draws so roughly and carelessly. The lending library has a good counter, but the reference-room has no connection with the stack space, while the librarian is put meaninglessly at the end of a corridor in a sort of watch-box between the reference-room and the newspaper room. The ladies' room is on the first floor. The public rooms are warmed by open fireplaces—a most objectionable mode to adopt, even though they are supplemented by a heating chamber in the basement. Architecturally, the design is one of the best. "Pantile" adopts what may be called the fashionable style of sprawling curved pediments and curiously proportioned other features. This he does with some cleverness; but he has little knowledge of library arrangement, and less concern as to the comfort of the librarian, if we may judge by the height and shape of the windows in the big dining-room, which is, if anything, too large. "Bernard" puts too many walls in his library, and, by wedging the hall of the librarian's house between the reference-room and the lending library, renders two stack-rooms or bookcase spaces necessary, leaving the librarian's room as the only means of communication between the two. The newspaper-room and magazine department are treated regardless of central control. The elevations are bald in the extreme. "Derige" is better in this respect, and in some ways has a good plan, though it is open to some of the faults already mentioned. The windows to the house are out of all proportion and quite inadequate. The author, who draws well, ought to have done much better than this. "Orb" is most careful. His entrance is too narrow, and has little public w.c.'s and lavatories on either side of it. The big public rooms are all at the back, connected one with the other. The plan, in fact, has many merits, both upstairs as well as down, and the elevations, though commonplace, are suitable. We recognise the author's care and painstaking, so that we regret not to be able to place him higher. "Dachs" shows originality and an endeavour to be up to date. His plan is worked out seriously, with not a few items deserving of praise; but he has not made an attractive design or drawn it particularly well. "Hotspur" is very inky in his perspective, which shows a tasteful design in spite of the paltry shafts at the main entrance. The rooms are nicely connected for supervision, but the borrowers' space is far too restricted. The house for the librarian is placed on the first floor. Domed lights occur over the public rooms in some cases. "Stone" sends a brick design badly drawn. His plan has a spacious central area surrounded by

the public rooms. The arrangement is rather good and on the right lines. The author has not worked it out sufficiently in detail, and his elevations we do not admire. "Phantom" is more crude still, and not so satisfactory. "Gib" has a great idea of balance. Without it his elevation would be nothing, and with it his plan is very badly contrived. Isolation dominates everywhere, and supervision would be most expensive and inconvenient. "Gib" is by no means devoid, however, of architectural notions. We hope he will do better another time. "Check-mate" sends a plan with a notion, but he has not properly worked it out. His elevation is excessively poor. His staircases are very bad. "Suburb" is next to a fault, and gives a big lending library. This is disconnected from the reference room, and the news-room is much too small. The elevation is commonplace, and there is no view given. The other designs are ranked in following order: "Wessex," "Klondyke," "Tee-Square," "Eric," "Excelsior," "Don," and "Don't Know," who has left his in pencil. He never will know unless he works better, though we do see some improvement in his present attempt. This should inspire him to make more effort another time, in spite of other attractions.

PAVEMENT AND OTHER LIGHTS.

WE have received from Messrs. Wilson and Co., pavement-light engineers, and makers of Wilson's patent dioptrical and other pavement-lights, of 24, Harrison-street, Gray's Inn-road, W.C., a new catalogue of their valuable "Dioptrical" and other pavement-lights for transmission of daylight to basements and underground premises. Wilson's "New Dioptric" lens is the latest improvement in this direction, and it is the result of many years' experience and study of optical principles. The inventors claim for this lens the dioptrical effect of the concave lens in diffusing light over a larger area than the semi-prism. Several illustrations show the application of this lens to pavement and floor lights, also to corridors, landings, stair-treads, inside floor-lights. They are made to prevent slipping, the upper part of the frames being of lead. Wilson's improved illuminating stallboards are made in several patterns, plain and ornamental, and of different sizes, to suit all requirements. The section of the bars under the lights enables the moisture of condensation to be carried away harmlessly. Several designs and sections are shown for floor and roof-lights worth the attention of the architect and builder of city business premises.

CHIPS.

The rebuilding and widening of Howford Bridge over the river Cart, near Paisley, has just been completed at a total cost of £2,630.

An important scheme which is being pushed forward by the Liverpool Corporation is that known as the Hood-street improvements. The demolition of property is being proceeded with; and when the undertaking is completed, Hood-street, which is now somewhat narrow, will be converted into a wide thoroughfare, and thus greatly facilitate vehicular traffic.

On Wednesday week, services were held in the church of All Hallows, London-wall, E.C., to celebrate the completion of the main features of the work of renovation. The church has been cleaned, repaired, and restored; the electric light has been installed; and a gilded cross, designed by Sir A. W. Blomfield, A.R.A., has been placed upon the top of the tower. The work has been in progress for seven years, and has cost £1,700.

The work of preparing for the erection of the new technical school, to adjoin the museum in William-Brown-street, Liverpool, is going on apace. The site has now been cleared of all the old buildings, and men are busily engaged in making the excavations necessary for the foundations for the building, to be erected from the plans of Mr. E. W. Mountford, F.R.I.B.A., of London.

In order to make future provision for the constantly growing traffic, the Directors of the Great Northern Railway Company have deemed it advisable, instead of doubling the three tunnels on the main line between Barnet and Potter's Bar, and duplicating the expensive viaduct and two tunnels at Welwyn, to seek Parliamentary powers next session to construct a loop line twenty miles long from Enfield to Stevenage Station, which will give an alternative route between Wood Green (about five miles from London), and the main line, a short distance south of Stevenage Station, where it will connect with lines already widened.

OBITUARY.

MR. MICHAEL DAINTRY HOLLINS, late of Whitmore Hall, died at Springfield Hall, near Newcastle-under-Lyme, on Tuesday. The deceased was the fourth son of the late Mr. Thomas Hollins, of Manchester, was born in 1815, and in 1841 he married Elizabeth, the daughter of the late Thomas Mackenzie, M.D., of Newcastle-under-Lyme, by whom he had a family of four sons and four daughters. His wife and sons predeceased him, but the daughters and several grandchildren survive. Mr. Hollins for some time practised as a surgeon; but in 1839 he came to Stoke to assist his uncle, the late Mr. Herbert Minton, the potter, taking charge of the manufacturing departments, while Mr. Minton retained the control of the commercial department. In 1849 the late Mr. Colin Minton Campbell became a partner in the firm, and in 1858 Mr. Herbert Minton died, and the business was subsequently carried on by Mr. Campbell and Mr. Hollins. In 1868 the partnership was dissolved, Mr. Campbell carrying on the manufacture of china and earthenware under the style of Mintons, while Mr. Hollins took over the encaustic tile branch. This business he afterwards carried on at the Cliffe Vale Works, under the style of Minton, Hollins, and Company, and obtained a wide reputation for the productions of his manufactory. The deceased gentleman was a D.L. and J.P. for Staffordshire, and for some years discharged the duties of chairman of the Newcastle Petty Sessional Division. Mr. Hollins was the first captain of the Stoke Company of what is now the 1st Volunteer Battalion North Staffordshire Regiment.

MR. ROBERT HOWE, who for a quarter of a century has been clerk of the works in the Office of Works Department at Windsor Castle, died suddenly on Saturday morning at his residence, within the Palace precincts. Mr. Howe, who was 68 years of age, formerly held a similar position at Kew, and since his appointment to Windsor Castle in 1873 had charge of all the alterations and improvements at the Royal residence and the buildings in the Home Park. He also supervised the reconstruction of the Lord Chamberlain's stores next the Winchester Tower, the arrangements for an improved water service for the Castle, and other works.

THE death occurred on Tuesday, at Broomlands, Hatherton, Cheshire, of Mr. C. J. MARE, ship and bridge builder. He owned shipbuilding yards at Blackwall, Millwall, and Northfleet, and constructed the Britannia tubular bridge over the Menai Straits, Saltash Bridge, and Westminster Bridge. He married the eldest daughter of the late Mr. Peter Rolt, once member for Greenwich. Mr. Mare was elected as Conservative member of Parliament for Plymouth in 1852, but was unseated on petition in the following year.

THE death occurred on Saturday morning of Mr. JOSEPH LEES, of Lytham View, Ashton-on-Ribble, Preston, aged 52. The deceased was an ex-Mayor of Bacup, which town he left in 1889. He was articled to Mr. Dawson, late of Newchurch, as architect and surveyor. Before the term for which he was articled had expired, Mr. Dawson gave up business, and Mr. Lees was transferred to Mr. Bell, of Accrington, where he remained until his articles expired, and then became an assistant surveyor to the Over Darwen Local Board, and afterwards was appointed surveyor to the Middleton Commissioners. For 4½ years he held this position, and then succeeded, in conjunction with his eldest brother, Mr. B. Lees, to the proprietary of collieries long held by their father, the late Mr. Robert Lees. Mr. Joseph Lees was a member of the local board and afterwards of the Corporation of Bacup, becoming mayor for 1887-8. Shortly after retiring from the chair he removed to Ashton-on-Ribble, as managing director of the Oxheys Spinning Company, Preston.

The town council of Birkenhead have decided to erect public baths at the north end of the town, at a cost of £13,000.

The Earl of Jersey presided over a Board of Trade inquiry held at Grimsby, on Friday, into the proposed light railway from Saltfleetby to Cleethorpes and Grimsby. On behalf of the promoter, it was stated that the scheme was estimated to cost £53,212, of which £2,000 had been left for incidental expenses. No objection was raised to the scheme as a whole, and the Commissioners decided to recommend the order to be made.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BATH MASTER BUILDERS' ASSOCIATION.—The annual dinner of this association was held on Tuesday night at Fortt's Restaurant, Bath, under the presidency of Mr. Geo. J. Long. The toast of the "National Association of Master Builders of Great Britain and the Federation of the West of England and South Wales" was given by Mr. G. Parrin, of Bristol. Mr. A. Krauss, of Bristol, responded. Mr E. W. Wood gave "Architects and Surveyors." Messrs. T. B. Silcock and H. W. Matthews responded. Mr. F. N. Cowlin, of Bristol, proposed "The Bath Master Builders' Association," and the president replied. Mr. W. Dyer, of the Weston-super-Mare Association, responded to the toast of "Kindred Associations."

EDINBURGH ARCHITECTURAL SOCIETY.—The first meeting of the session in connection with this society was held on the evening of Feb. 2nd in Dowell's Rooms, George-street, when there was a large turn-out of members. Mr. W. N. Cumming, the president, occupied the chair. The awards in the various prize competitions held during the past session were announced. These were as follows:—Hon. president's prizes for "A design for a branch free library, museum, and picture gallery"—first, Mr. W. A. Mellon; second, Mr. W. Fairbairn. President's prize for "Six sheets of measured work," Mr. J. H. Rutherford. Vice-president's prize for "Design for reredos and altar frontal for a country church," Mr. Percy E. Nobbs. Mr. Cumming announced that Mr. John Kinross, A.R.S.A., had consented to accept the honorary presidentship, and then proceeded to sketch briefly the work proposed to be undertaken by the society during the session upon which it had entered.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—Mr. Wm. H. Thorp, F.R.I.B.A., lectured before this society in the Leeds Institute on Monday evening on "Early Renaissance Sculpture in Tuscany." Mr. Thorp gave a sketch of the chief characteristics of the three great schools of sculpture—the Greek of the time of Pericles, the early Renaissance of the 15th century, and the culminating period of the Renaissance.

NOTTINGHAM MASTER BUILDERS' ASSOCIATION.—The annual dinner of this association took place on the 3rd inst. at the Albert Hotel, Derby-road. Mr. J. Wright, president of the association, occupied the chair, and Mr. W. Edgar, vice-president, the vice-chair. Mr. J. Woodsend submitted "The Mayor and Corporation of Nottingham," and Councillor A. Pyatt replied. The chairman next proposed "Success to the Master Builders' Association." He congratulated the members upon the activity of the past year. Another source of congratulation was the fact that they had had very little trouble with the workmen during the past year. Last year they announced that they had reconstructed the Master Builders' Association, by which a committee representing every trade undertook the matters relating to the different sections. A very voluminous report prepared by Mr. Hodson, their energetic secretary, recounted the work done by those various committees, upon which they had to congratulate themselves. As an association, they were on satisfactory terms with the Architects' Association, and they had recently had a meeting with members of the Architects' Association, at which they put before them various points which they wanted them to consider in framing and drawing up future contracts, and the association received them in a very cordial and business-like manner. Mr. Henry Vickers and Mr. Frank Hodson responded to the toast. The vice-president proposed "The Visitors," to which Mr. Starkey (Leicester) and Mr. Belcher replied; and Mr. F. Fish gave "The Chairman." The speeches were interspersed with songs.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—The monthly meeting of this society was held on Tuesday evening. The chair was occupied by Mr. Joseph Smith (vice-president). Mr. Hugh Stannus, F.R.I.B.A., of the Royal College of Art, delivered a most interesting and useful lecture on "Proportion."

The Bishop of Rochester dedicated the new church of St. Hugh, Southwark, on Saturday afternoon. The church, which is situated in Crosby-row, Tabard-street, one of the narrow and old-fashioned streets at the rear of the site once occupied by the Marshalsea Prison, is in connection with the Charterhouse Mission.

"THE QUEST OF SIR PARSIFAL."—NATIONAL SILVER MEDAL DESIGN FOR A SMALL ART DEPARTMENT.—READING ROOM, HOTEL MARQUARDT, STUTTGART.—TECHNICAL SCHOOLS AND LECTURE HALL, WEST HARTLEPOOL.—DESIGNS FOR A PUBLIC LIBRARY.—CHAPEL AND SCHOOLS, WAVERLEY PARK, NUNHEAD.—OLD AND NEW DECORATIVE METAL WORK.

Our Illustrations.

"THE QUEST OF SIR PARSIFAL": NATIONAL SILVER MEDAL DESIGN.

AFTER five years' wandering in search of the Castle of Carbonek, where he must go to fulfil the quest of the Sangreal, Sir Parsifal comes at length to a tree in which he sees a vision of two children. They give him news of the road he must travel, and vanish. The cartoon illustrating this incident, which we publish to-day, was awarded a National Silver Medal last year, and has since been bought by Sir William B. Richmond, R.A., who gave his permission for its publication here. Miss Violet M. Holden, of Knowle, is the author of the design.

NATIONAL SILVER MEDAL DESIGN FOR A SMALL ART DEPARTMENT.

THIS design, for a small art department, is in the Early Roman style. On the ground floor there is a large central hall, lighted from the central dome above, which is also intended to be used as a sculpture gallery. To the right of the hall on entering is a library and librarian's room; on the left a large gallery for paintings. A hoist from the basement is provided for taking pictures to this gallery. There is also a lecture theatre on this floor to seat about 40 or 50 students, also ample cloak room and lavatory accommodation. The basement is used for picture stores and heating-chamber, &c. D. MCKAY STODDART.

HOTEL MARQUARDT, INTERIOR OF READING ROOM, STUTTGART.

MESSRS. EISENLOHR AND WEIGLE are the architects of this somewhat sumptuous building, which is furnished throughout in accordance with the style displayed by this apartment, wherein cabinetwork of a refined type is made to play an important part. The heating radiator is located in a sort of sideboard, after the fashion of a buffet, the sides of the lower part or body being filled with a metal grille. The newspaper-holders on the table give, of course, a singular effect in the picture, but are handy enough for use when the habit has been acquired. The photograph given by us to-day was sent us by Herr Ernst Wasmuth, the well-known architectural publisher, of Berlin, and it forms one of the plates appearing in his excellent folio publication, entitled, "Architektur der Gegenwart."

TECHNICAL SCHOOLS AND PUBLIC HALL, WEST HARTLEPOOL.

THESE buildings are an extensive range erected by the Town Council of West Hartlepool for mechanical science and art instruction, and are an attempt to give a large amount of accommodation at a minimum of expenditure, the contract having been let for £11,230 to Mr. Thos. Dickinson, of Middlesbrough, by whom the buildings have been erected, the cost per cube of contents not reaching the sum of 4d. per foot as measured in the ordinary way. The buildings have been extended beyond the accommodation provided by the competition plans, and as they occupy in length the whole site from front to back, the plan had to be accommodated to the awkward angle formed by the building-line of the Hart-road front with the square of the side streets, and seating having to be provided for 1,400 people in the large hall to this front, it necessitated every inch of space being utilised to the best advantage. The several fronts are faced with the best Accrington red pressed bricks with dressings of Dunhouse stone. Inside the walls are plastered and distempered suitable tints. All the halls, vestibules, and corridors, with lavatories, &c., on each floor, are of fireproof construction, and paved with marble mosaic to former, and granolithic cement paving, with border in colour, to latter items. The staircases are of hard York stone, with spandrel soffits, and the floors of classroom, lavatory, &c., of wood-block construction, and all the fittings internally are specially designed to be in character with the building, while keeping in view the required limitation of cost. The whole of the ranges are heated by hot-water pipes on the low-pressure system, with radiators and air-valves of the latest pattern. The drawing from which this view is taken is a hurried sketch in colour by the architect to explain the general idea of the block of buildings to the committee, made by their desire at a day or two's notice from immature plans, before the working drawing were elaborated; but it shows the scheme generally as carried out, and from lack of time is all that is available. Mr. H. A. Cheers is the architect.

"BUILDING NEWS" DESIGNING CLUB: A SMALL PUBLIC LIBRARY.

(FOR description and awards, see page 197.)

NEW CHAPEL AND SCHOOL, NUNHEAD.

THIS block of buildings has recently been erected in the Ivydale-road, Nunhead (a district known as Waverley Park), for the Methodist New Connexion. The site was given by the adjoining owner, and measures 100ft. frontage with a depth of 90ft., none too large for the accommodation required—viz., a chapel to seat not less that 400, and a hall or schoolroom to accommodate the same number, besides accessories. By uniting the two in one block, as shown, space has been economised, whilst ample light is secured to the chapel by clerestory windows above the roof of the hall, which is kept at a lower level. There are no galleries; but provision is made for such in future when required. The walls are of brick, with dressings of Monk's Park stone. The upper part of turret is of oak. The design is the result of a limited competition, Mr. R. Clamp, of Woking, being the architect. Mr. E. Jones, of Nunhead, is the builder, and the cost was under £3,000.

DECORATIVE METALWORK, OLD AND NEW.

THE sheet of sketches which we publish amongst this week's illustrations contains an elaborate and beautiful design in scroll ironwork, which forms the top of a reading-desk in a church near Mantua. The long arm to the left is for the purpose of suspending a lantern to light the lectern. The door-handle from Ulm is decorated with a couple of freely-treated dolphins, joined at the snouts and tails. C and D are suggestive examples of door furniture from a house in Wertheim-on-the-Maine, whilst A and B are modern designs by Professor Ohmann for the palace of the Hradschin at Prague.

Mr. J. Palfreman, late of the Royal Courts of Justice, commenced his duties on Tuesday as works resident engineer at the Houses of Parliament, having been appointed in succession to Mr. W. J. Prim, who has retired upon a pension.

At Newhailes House, N.B., on Friday afternoon, Sir Charles Dalrymple, Bart., M.P., was presented with his bust in marble from the Grand Lodge of Freemasons. Sir Charles has been Grand Master for three years, and the gift was in recognition of his craft. The bust, which stands on a marble pillar, has been executed by Mr. W. Grant Stevenson, R.S.A., of Edinburgh, and after exhibition at the Royal Scottish Academy will be placed in the Freemasons' Hall.

ROYAL ACADEMY DRAWINGS, 1898.

THE last day this year for sending in architectural and decorative drawings to the Royal Academy is Monday, March 28th next.

We have to acknowledge many promises to lend us drawings for reproduction before they are sent in, to be illustrated in our pages after the exhibition opens as in former years. We shall be glad to receive other offers of drawings intended for the Royal Academy, and they should reach us as early as possible, not later than March 24th. Contributors who may wish us to receive and deliver their drawings for them to Burlington House (and we are willing to undertake this free of charge for contributors) must fix a label on the back of the picture and attach another by means of a string. These labels must give the title of the subject, and also the name and address of the sender. The labels can be obtained from the secretary of the Royal Academy of Arts, Burlington House, Piccadilly.

CHIPS.

The Bishop of Ely has presented an altar frontal to his cathedral as a thank-offering for the escape of himself and a party of friends, who were in the gallery of the episcopal palace when the floor gave way. The frontal has been worked by the Wantage Sisters, after a design taken from a fifteenth-century vestment in Rheims Cathedral, and the gold material was brought from Moscow.

A meeting of the Hartlepools timber merchants was held the other day, presided over by the mayor, to consider the regulations submitted by the railway company for working the timber trade, whose leading members have recently expressed complaints respecting the very inefficient accommodation provided for the discharging of cargoes. The general opinion expressed respecting the proposals of the company was that the trade would be seriously harassed thereby, and a committee was appointed to ascertain the feeling of the trade upon the subject, and to report thereupon.

Mr. George Bradbury, the surveyor to the Diocese of Liverpool, has been engaged for several months in collecting information with reference to St. George's Church, Liverpool. The present building is not in any part, except the internal columns and fittings, the original erection, as the outside walls were at one time pulled down separately and rebuilt as they are to-day. Furthermore, the present spire was only erected by the municipal authorities in 1818, the original spire having been demolished some nine years previously.

At the last meeting of the town council of Salford the salary of Mr. Wilson, principal of the technical institute, was raised from £350 to £450 per annum; and that of Mr. Turner, the borough electrical engineer, was increased from £260 to £300 per annum.

Works of heating and of hot and cold water-supply have just been completed at the workhouse at Northallerton. Mr. F. Graham Fairbank, of York, was the engineer, and Mr. Bedford, of Northallerton, the contractor. The cost was £540.

The demolition of the Elephant and Castle and adjoining buildings forming an island block of properties facing Newington-causeway, Walworth-road, and Short-street, is in progress. The London County Council have voted £9,550 towards the contribution by the Newington vestry for the widening of the thoroughfare at this important centre. We illustrated the new hotel and premises, which are to be built from designs by Mr. John Farrer, of Finsbury-pavement, in our issue of the 21st ult. The contract has been taken by Mr. H. L. Holloway, of Deptford, at £35,000.

The Wolverhampton Board of Guardians have finally decided to purchase, as the site for the proposed new workhouse, the New Cross estate of 50½ acres, the price paid being £11,128.

In St. Mark's Church, Noel Park, London, a pulpit has been dedicated in memory of the late Bishop of Wakefield. A carved Litany desk, the gift of the Boys' Guild, was also used for the first time on Sunday morning. The design of the pulpit, which is of Caen stone, has been given by the architect of the church, Mr. Rowland Plumbe. In the central niche is a figure of St. Mark bearing the patriarchal cross of Alexandria, and it is proposed, when funds allow, to fill the other niches with figures of Bishop Walsham How and St. Chad, Bishop of Lichfield.

A new hall is in course of erection at Muriestonroad, Dalry, N.B., for the Salvation Army. For adult work the building will accommodate 350, and for juvenile services 200. Officers' quarters are also provided. Site and premises will cost nearly £1,000. The foundation-stone-laying ceremony took place on Saturday.

Building Intelligence.

HOYLAKE, CHESHIRE.—The new town-hall was opened by Colonel Cotton-Tedrell, M.P., on the 2nd inst. The council offices are all situated on the ground floor, and are approached from Market-street by a central porch. The council chamber, which measures 38ft. by 22ft., stands at the right of the main entrance, and possesses a lofty coved and recessed ceiling, filled with enriched panelling. By pilasters the walls are formed into panels, the lower portion having an oak dado. The public-hall, which is on the first floor, provides accommodation for 500 persons. The stage has been provided with a movable proscenium, and there are also ladies' and gentlemen's dressing-rooms, lavatories, refreshment-rooms, promenades, and a caretaker's residence. The remaining departments included in the scheme are the fire-station, and the technical classrooms. Heat is supplied to the buildings by means of hot-water pipes, open fires, and a ventilating radiator. The general contract has been carried out by Mr. W. H. Forde, from the designs, and under the superintendence, of the architect, Mr. T. W. Cubbon, of Birkenhead, who was placed first in open competition by a professional assessor. The total cost, including furnishing, has been about £6,500.

LEEDS.—The business of the National Provincial Bank in Leeds was transferred on Friday from the old premises at the junction of Albion-street and Bond-street to the new structure in Park-row, opposite the site of the old post-office. Messrs. Perkin and Bulmer, of Leeds, are the architects for the new bank, which is two stories in height, and in the Renaissance style. The lower half of the elevation is faced with grey granite beneath and black Labrador granite above. The upper half is a mixture of scarlet bricks from Berkshire and Yorkshire stone. Light green Westmoreland slates cover the roof. The back of the building has a frontage to Basinghall-street, and here salt-glazed Leeds bricks and timber-framed windows, painted white, are used. The bank-chamber is 70ft. by 42ft., the walls being panelled in teak to a height of 12ft.; above this there is a lining of marble, and the frieze and ceiling are wrought in fibrous plaster. The counter is of teak, and has a highly-wrought aluminium grill. The floor in front of the counter is of marble mosaic, and behind of oak blocks. The electric-light fittings are of aluminium. A strong-room of steel is provided, and close to it is a lift. On the second floor accommodation has been provided for the clerks, including a luncheon-room; and rooms for the porter are situated above the second floor. The general contract has been carried out by Messrs. Armitage and Hodgson, of Leeds.

MELTHAM.—A town-hall, which has been presented to the growing district of Meltham, near Huddersfield, by Mr. Edward Brook, was formally opened on Saturday. In style the building is semi-Gothic, and the shell is constructed of Yorkshire rock-faced wall stones, relieved with ashlar dressings. The entrance opens into a vestibule and corridor, the clerk's, surveyor's, and other offices being on the first floor. It was thought unnecessary to provide accommodation for an assembly-room, and accordingly the council chamber and committee-room have been allocated to the first floor. Both apartments are furnished in solid mahogany, and upholstered in tapestry and plush. A four-dial turret-clock surmounts the building, and, exclusive of the site, which was also given by Mr. Brook, the cost of the building and furnishings is £2,882.

The death of Mr. Robert Chapman Garland, of Potternewton-lane, Leeds, took place on Saturday afternoon. Mr. Garland, who was in his 73rd year, died from heart-disease, after ten days' illness. For many years he carried on business in Leeds as a builder.

At a meeting of the subscribers of the Royal Alexandra Children's Hospital held at Rhyl last week, it was reported that the committee had selected a tender of £15,689 for the erection of the new hospital block and one of £12,041 for the administrative block, making a total of £27,710. The total assets at present amounted to £17,757, and the committee thought it desirable to proceed only with the erection of the hospital block, and to defer the other work until the funds had been augmented. The report was adopted.

Engineering Notes.

LEITH AND NEWHAVEN EXTENSION RAILWAY.—Messrs. William Beattie and Sons, Edinburgh, who have secured the contract for the first section of the extension of the Caledonian Railway Company's Newhaven and Leith extension, have already begun operations. Although this section of the work is scarcely a mile in length, the contract price is about £50,000. The portion of the extension now commenced leaves the present Leith line at two places, the one at Lixmount, near Newhaven Station, and the other at a point a little nearer Leith. These two short lines unite at a short distance, and following a south-easterly course, the new line passes through Blair Park and beneath Ferry-road, after which it crosses by heavy bridges first the North British Railway, and then the Water of Leith. The line proceeds on a brickwork viaduct. The Bonnington-road is crossed diagonally by a skew bridge, and the contract terminates in the grounds of Pilrig. In the short mile described there is not only a good deal of heavy cutting, but seven bridges, a viaduct, and three foot bridges over the line have to be erected. The other contracts, which have not yet been let, will carry the line in an easterly direction, by way of Craigentinny, to a terminal fork, the one branch ending to the east of the Edinburgh Dock at Leith, and the other branch ending at a proposed goods station on the site of the Bath-street soapworks.

A stained-glass window, in memory of the late rector, the Rev. W. H. E. McKnight, has been placed at the east end of Silk Willoughby church, near Sleaford. It has been designed and executed by Mr. C. Whall, at a cost of £300.

Mr. Thomas J. Brady has been appointed as superintendent of buildings for the boroughs of Manhattan and Bronx, near New York. Mr. Brady was for six years in charge of the Building Department of New York.

A Local Government inquiry was held at St. Austell on Thursday in last week by Col. Hepper, relative to the application by the urban district council for sanction to borrow £1,275 for the acquisition of public offices and a fire station.

New business premises have been erected on the sites of three houses in Fore-street, Ipswich, for a firm of ironmongers. The buildings are three stories in height, and have been erected by Messrs. Thomas Parkington and Son, from designs by Mr. Thomas W. Cotman, also of Ipswich. A supper to the workmen engaged on the job was given on Wednesday week.

The town council of Godalming have decided to purchase the Public Hall and Stone House for £3,525, as a site for proposed municipal buildings to be erected at an estimated cost of £10,000. They have also determined to advertise for competitive plans from architects, offering a premium of fifty guineas for the design should it not be carried out. A letter was received from Mr. S. Welman, of Godalming, stating that in 1887 he was instructed by the council to obtain particulars for municipal buildings, and he did so, preparing plans, designs, estimates, and reports for several sites. None of that work had ever been paid for, and the only compensation he had had was the expectation that when the buildings were proceeded with, he should be allowed to continue the work upon which he had already bestowed so much thought. No action was taken.

The whole of the work to be carried out in connection with the restoration of Wesley's House, including the outfit, the new roof, and the entire reconstruction of the basement in concrete, with underpinning of foundations, will cost £1,080, or £480 in excess of the original estimates. The Wesley's House Committee, however, have unanimously resolved to face the entire outlay. The contract has been intrusted to Messrs. Holloway Brothers, of Battersea, and the works, including the decorative sections, which will be in 18th-century style, are to be carried out under the direction of Messrs. Gordon, Lowther, and Gunton, architects, of Blomfield-street, E.C.

A Bill will be introduced into Parliament next session to incorporate a company with powers to construct an underground electric railway at Brighton, from a point near the terminal station of the London, Brighton, and South Coast Railway Company to a point under King's-road, but with openings under the parade communicating with the beach. The total length of this railway will be five furlongs 7·25 chains, and the capital proposed to be raised for its construction is £120,000. The maximum fare proposed to be charged is 2d. for the whole distance.

COMPETITIONS.

SOUTH KIRKBY.—In a limited competition for a new Wesleyan church and Sunday-schools at South Kirkby, near Pontefract, the design of Mr. Geo. F. Pennington, M.S.A., of Central Chambers, Castleford, has been accepted. The building is designed in the Late Gothic style, and has accommodation on the ground floor for 250 and an end gallery for 100. The school will also seat 200. Also choir and preacher's vestries are provided. The cost will be about £1,500.

WESTMINSTER.—For the Poster Competition in connection with the forthcoming Art Metal Work Exhibition at the Royal Aquarium, Westminster, the following members of the Council of the Exhibition have been elected judges:—Messrs. George Frampton, A.R.A., Lewis F. Day, George C. Haité, Maurice B. Adams, Ellis Marsland, and Josiah Ritchie. Professor Banister Fletcher, the chairman, is ex-officio a member of this committee of judges. The designs are to be received on Feb. 28.

CHIPS.

The restoration of the parish church of Wellington, Salop, has been decided upon. The church will be closed after Easter Sunday. The architect will be Mr. C. R. Dalgleish, of Wellington, who will carry out the work, with Sir Arthur W. Blomfield, A.R.A., as consulting architect.

Professor Francis W. Chandler, of the Massachusetts Institute of Technology, has been appointed as the chief architectural supervisor of Boston, Mass. The architectural division is taken from the buildings department and attached to the engineering department of the city. During the past year Professor Chandler has been architectural adviser to the mayor.

A new academy, erected by the Leith School Board on the site of the old Leith High School at the south-west corner of the Links, was opened for teaching about a week ago. Mr. Craig is the architect.

Admission will be by ticket only on the occasion of the opening of the new building of the Passmore Edwards Settlement, Tavistock-place, to-morrow (Saturday), at 8 p.m. Applications for tickets should be made by letter to the Warden.

In the case of Joseph Goode, of Fernlea-villas, Palmerston-road, Walthamstow, E., builder, the order of discharge from bankruptcy has been suspended for two years ending Jan. 13, 1900. In that of Joseph Edwards and Robert John Edwards (trading as Edwards Brothers), of Lingfield, Surrey, builders, the order of discharge has been suspended for three years endieg Jan. 19, 1901.

The vicar of St. James the Great, Bethnal Green, is appealing for £4,000 with which to carry out the necessary works of restoration. "The church," he says, "is practically unfit for service. There are great holes in the roof—the stonework will have to be renewed—and such things as lead-work, pipes, gutters, &c., are either gone or broken. Internally the plaster has fallen down from the ceilings—damp and mould disfigure the walls—and a heating apparatus must be supplied."

The London Technical Education Board has made a special grant of £1,000 towards the erection of the new workshops for masons' and plasterers' classes which are to form part of the buildings associated with the great hall of the Battersea Polytechnic. A donation of £100 has also been made by the Clothworkers' Company towards the building fund for the hall. The buildings are to be proceeded with at once; but £1,400 is still required to meet the cost, so that the new building may be opened free from debt. The hall is designed to seat about 1,000 persons, and the estimated cost is £6,500.

Colonel W. R. Slacke, R.E., Local Government Board Inspector, held an inquiry at the Public Offices, Egremont, on Friday, into an application by the Wallasey District Council for power to borrow £930 for public pleasure-grounds.

A new wing is being added to Cardiff Castle for the Marquis of Bute, to contain a suite of state apartments. The plans have been prepared by Mr. Frame, and the contractors are Messrs. W. Thomas and Co., of Cardiff.

The partnership hitherto subsisting between T. S. Tilley, E. J. Tilley, and G. C. Tilley, general contractors and artesian well engineers, Walbrook, E.C., and Walbrook Works, Cambridge-road, E., under the style of Thomas Tilley and Sons, has been dissolved so far as regards T. S. Tilley.

The school board for Dundee have raised the salary of their architect, Mr. Langlands, from £30 to £100 a year. This is to cover the work of general superintendence and attention to repairs and alterations, he being paid, as hitherto, a commission on new works.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

LANDLORD. (The obvious way is to consult a respectable architect.)

"BUILDING NEWS" DESIGNING CLUB.

FIFTH LIST OF SUBJECTS.

E.—A Small Convalescent Home for 24 men, by the seaside, on a site overlooking the shore at the head of the cliff, where the land is practically level. The position is exposed, and the building, which is to be built in local coursed stone, must be planned accordingly. The aspect is south-west on the sea-front side. The accommodation is to provide a dining-room, recreation-room, small writing-room or library, two dormitories, a superintendent's residence, comprising parlour, adaptable as an official room, a living-room 14 by 14, or of that area, a kitchen, scullery, and offices. A bath-room with two baths, lavatory with 12 basins; five w.c.'s and urinals, for the use of the inmates; also a boot-room, cloak-room, and box-room. The whole of the accommodation is to be provided on the ground floor, excepting one dormitory and the superintendent's two bed-rooms and two bed-rooms for the female servants. A house-yard and small laundry, well separated from the patients' departments, to be provided. The building is to be suitable for 24 men, exclusive of the staff. The roofs to be covered with tiles. The style is to be suitable for stone. Two plans, two elevations, one section, and a view. Scale, 8ft. to the inch for elevations. Plans and section may be drawn to 16ft. to the inch.

DRAWINGS RECEIVED FOR MOUNTAIN CHURCH.—"Lady," "Hotspur," "Chuckle," "Olliwops" (no name and address), "Tee Square," "Phantom."

Correspondence.

CALIFORNIA UNIVERSITY COMPETITION.

To the Editor of the BUILDING NEWS.

SIR,—The Royal Institute of British Architects has been desired by the Marquess of Salisbury to give publicity to the international competition for the Phebe Hurst Architectural Plan of the University of California.

In consequence of this request, I should esteem it a favour if you would give me the opportunity of stating in your columns that programmes of the competition, together with maps of the site, can be obtained on application to the Secretary of the Royal Institute of British Architects, and that further photographs and a plaster relief map of the site are on view in the library of the Royal Institute.—I am, &c.,

W. J. LOCKE, Secretary.

9, Conduit-street, London, W., Feb. 9.

QUANTITIES AND TENDERS.

SIR—The inclosed correspondence is of such vital interest to architects who take out their own quantities, to the public whom they serve, and especially to public bodies who must by law advertise for tenders, that I venture to send it to you for publication.—I am, &c,

ROBERT WILLIAMS.

17, Effiogham-road, Lee,
London, S.E., Feb. 3, 1898.

(I.)

17, Effiogham-road, Lee, London, S E., Sept. 17, 1897.

DEAR SIR,—May I ask you to be so kind as to draw the attention of some of your members to the inclosed advertisement for tenders for the new wards at the Lewisham Infirmary?

May I also ask you to kindly let me know whether your Association has any rule with regard to advertised tenders? My reason for this is that some of the best London builders have written to me that (*a*) they have "found it necessary to make it a rule *not* to tender for advertised work"; and (*b*) "that the forms of tender are generally such as we cannot agree to."

Do you issue reports and lists of members as the R.I.B.A. does? And if so, and I might, I would be glad, by payment, of course, to obtain a copy.—Yours faithfully,

ROBERT WILLIAMS.

R. S. Henshaw, Esq., Secretary to the Builders' Institute,
31 and 32, Bedford-street, Strand, W.C.

(II.)

31 and 32, Bedford-street, Strand, W.C., Sept. 18, 1897.

DEAR SIR,—I am obliged by your letter of the 17th inst., which shall be laid before my council at their next meeting. The Institute does not issue lists of members and reports, therefore I regret I cannot supply you with one.—Yours faithfully, R. S. HENSHAW, Secretary.

Robert Williams, Esq., 17, Effingham-road, Lee, S E.

(III.) Oct 20, 1897.

DEAR SIR,—Your letter of the 17th inst. [September R.W.] was laid before the council of this Institute at their last meeting, and I am desired to say in reply to your first inquiry as to whether the Institute has any rule with regard to advertised tenders, that they have not.

There is no doubt but that as a rule leading builders in London do not tender for works which are publicly advertised, for this reason: that they do not consider the competition equal, as it is open to anyone to tender, and there is consequently a great deal of reckless tendering, and substantial men in very many instances find it a mere waste of time.

In reply to the last paragraph of your letter, the reports and lists of the Institute, and also of the Central Association, are private, and confined to its members.

In reference to the advertisement* itself (no responsibility for which they conclude rests with yourself), they desire to say that the terms are not such as to induce responsible builders to take any trouble in reference to the matter.

It is impossible to express any opinion as to the form of tender, as it is not before them; but they consider there is the greatest objection to tendering upon bills of quantities prepared by the architect, and though there is no rule in the Institute, there is a general understanding that bills of quantities should be prepared by a properly qualified independent surveyor.—Yours, &c.,

Robert Williams, Esq. R. S. HENSHAW, Secretary.

[* See copy at end.]

(IV.) Oct. 20, 1897.

DEAR SIR,—Allow me to thank you for your reply to my letter of September the 17th. I note your remarks about the advertisement for tenders for the Lunatic Pavilion at Lewisham, and beg to say that the copy was shown to me for approval, and, as I could see nothing in it of which I could not approve, I would be extremely glad (for future guidance) if you would kindly ask your Association to point out specifically what the objectionable terms were.

The last paragraph in your letter contains a statement of the most serious moment to architects who take out their own quantities. Would you, therefore, kindly ask your Association to be so kind as to inform me why "they consider there is the greatest objection to tendering upon bills of quantities prepared by the architect"? The paragraph ends by stating that "there is a general understanding that bills of quantities should be prepared by a properly qualified independent surveyor." Am I to understand from this that there are no architects "properly qualified" for taking out quantities?

I beg to inclose a copy of the form of tender,† to which reference has been made, and would be very thankful for your Association's remarks thereupon. Hoping you will convey my thanks to your Association,—I am, &c.,

R. S. Henshaw, Esq. ROBERT WILLIAMS.

[† See copy at end.]

(V.) Oct. 25, 1897.

DEAR SIR,—I must apologise for not having previously acknowledged your letter of the 20th inst. It shall be placed before my council at their next meeting.—I am, &c.,

Robert Williams, Esq. R. S. HENSHAW, Secretary.

(VI.) Nov. 8, 1897.

DEAR SIR,—In reply to your letter of the 20th ultimo, I am directed to say that in reference to the first part of your letter, the observation was intended to apply in a general way to such advertisements, and not particularly to the one in question.

Replying to the other part of your letter, the objections to an architect acting as quantity surveyor and architect on the same work must be obvious, and does not involve the question of qualification at all. The practice, if not against any rule of the Royal Institute of British Architects, is certainly discountenanced by its leading members—in the London district, at any rate‡. There is nothing in the form of tender except so far as it contains reprints previously referred to as objectionable.—I am, &c.,

Robert Williams, Esq. R. S. HENSHAW, Secretary.

[‡ Every graduate—i.e., certificated by examination, member of the R.I.B.A.—is examined in taking off quantities, measuring, and estimating. Clause 15 of "Professional Practice" specifically mentions quantities as part of the architect's work.—R. W.]

(VII.) Nov. 9, 1897.

DEAR SIR,—Allow me to acknowledge with thanks, your letter of yesterday's date in reply to mine of Oct. 20th. May I point out to you that you do not answer my earnest request to know why "they (the builders) consider there is the greatest objection to tendering upon bills of quantities prepared by the architect"?

You only tell me now that "the objections to an architect acting as quantity surveyor and architect on the same work must be obvious."

Now, a "grave objection," I confess, ought to be obvious; but to me it is not, and I still, respectfully, ask that the grave objection might be pointed out.

As an architect properly qualified to take out his own quantities, and who does so, I am, as far as I can gather, precluded from receiving tenders from members of your society. To be ostracised in this way seems to me to be a grave matter indeed, and I would be glad if you would kindly see your way to furnish me with a definite reason for this action.—Yours,

R. S. Henshaw, Esq. ROBERT WILLIAMS.

(VIII.)—*RE* TENDERS, ETC.

Jan. 28, 1898.

DEAR SIR,—May I point out to you that I have not yet received a reply to my letter to you of Nov. 9, 1897?

It is very important that I should have a reply, because it appears to me, from your letter to me of Oct. 20, that, as regards the mode of my carrying out my professional practice, I have the choice of two alternatives—cease from taking out my own quantities, or, have my jobs boycotted by the members of your society.

As this subject and this position is of great moment to practising architects (and I am sure you will admit this), it is my intention to publish these letters, and I would, therefore, esteem it a kindness if you favoured me with a reply as soon as possible.—I am, &c.,

R. S. Henshaw, Esq. ROBERT WILLIAMS.

(IX.) Feb. 2, 1898.

DEAR SIR,—Your letter of the 28th ultimo was laid before my council yesterday, and I was directed to say that when they replied to your first communication on the 20th October last, they had no idea or intention of engaging in a controversial correspondence extending over a considerable period. You asked them for information in reference to a difficulty you had experienced, which they presumed was a practical difficulty, and to the best of their ability they gave you information upon the points involved. Your letters of Nov. 9 and Jan. 28 being so controversial, my council prefer leaving them unanswered.—Yours, &c., R. S. HENSHAW, Secretary.

Robert Williams, Esq.

(X.) Feb. 3, 1898.

DEAR SIR,—Thank you for your letter of yesterday's date. A reference to your former letters and to the dates thereof will show you that neither the "controversial" nor the "extending over a considerable period" character of the correspondence was caused by any question raised by me or delay of mine.

In publishing these letters, I must express strongly my regret that your Council is unable to give me a reason for stating that "there is the gravest objection to tendering upon bills of quantities prepared by the architect, and though there is no rule in the Institute, there is a general understanding that bills of quantities should be prepared by a properly qualified surveyor."

Although I pointed out to you that architects were properly qualified (none ought to be more so), you were unable to give me a reason, but said that the grave objection was "obvious." The matter was thus shown to be not altogether one of qualification, as you, indeed, admit. This question of quantity-taking affects hundreds, probably thousands, of architects, and the question of not tendering affects all public bodies, who have to advertise if the contract be above £50.

Personally, as the correspondence shows, I have been refused tenders, and, so far as I can see, I must conform with the "general understanding" of your Institute, or my practice and living come to an end, so far as your Institute is concerned. ROBERT WILLIAMS.

R. S. Henshaw, Esq.

LEWISHAM UNION.

ERECTION OF LUNATIC WARDS.

TO BUILDERS AND CONTRACTORS.

Notice is hereby given that the Guardians of the Poor of the Lewisham Union will meet at the Union Offices, Lewisham, on MONDAY, the 27th day of September, 1897, at 4.30 p.m., to consider TENDERS from persons willing to CONTRACT for the ERECTION of LUNATIC WARDS at the Infirmary, High-street, Lewisham, according to plans and specification to be seen at the office of the Guardians' Architect, Mr. Robert Williams, 17, Effingham-road, Lee, S.E., on any week-day, except Saturday, between 10 a.m. and 4 p.m.

No tender will be received unless made out on one of the lithographed forms, which, together with a copy of the bills of quantities (prepared by the said architect), may be obtained at the office of the said architect, upon depositing with him the sum of £1 1s., which will be returned upon the receipt of a bona-fide tender for the works.

The Guardians do not bind themselves to accept the lowest or any tender.

Tenders must be signed and inclosed in envelopes duly sealed with sealing-wax, and endorsed "Tender for Lunatic Wards," and delivered at the Union Offices, Lewisham, not later than 4 p.m., on the said 27th day of September.

The person who may be accepted as the contractor must be prepared to enter into a bond with two sureties (to be named by him for approval) for the performance of

his contract in such an amount as the Guardians may determine.—By order, H. C. MOTT,
Union Offices, Clerk to the Guardians.
286, High-street, Lewisham, S.E., Aug. 10, 1897.

A TENDER

For erecting the proposed Lunatic Wards at the Lewisham Union Infirmary in the High-street, Lewisham, S.E.

To the Guardians of the Poor of the Lewisham Union in the County of Kent.

Ladies and gentlemen, ... willing to carry out the above works in accordance with the Drawings, Conditions, Specification and Quantities prepared by the Guardians' architect, Mr. Robert Williams, F.R.I.B.A., and to complete the same to his entire satisfaction within a period ... months from the date of signing of the contract, if not prevented by unforeseen circumstances, for the sum of ... £).

And ....submit the following names as Sureties for the due performance of the contract ... ...

Name . Name . .

Address .... Address ... ...

This Tender is delivered with the knowledge that the Guardians do not bind themselves to accept the lowest or any Tender.

Signed .....
Address .....
Date September 1897.

N.B.—Sealed Tenders endorsed "Tender for Lunatic Wards" are to be delivered at the Union Offices, 286, High Street, Lewisham, S.E., on or before the 27th day of September, 1897, at 4 p.m.

Intercommunication.

QUESTIONS.

[11897.]—**Penalties for Delay.—Liquidated Damages.**—Can anyone inform me what instances there may be of penalties for delay having been enforced? I have a case in hand. Considerable delay in finishing work has been incurred, and the builder smiles at the idea of the penalty clause, saying such is never enforced. If any of your readers can give instances, naming amount for week or day, total amount deducted, name of building, locality, architect, &c., I shall feel greatly obliged?—NEMO.

[11898.]—**Paint for Oak Joinery Work.**—A client of ours wishes his oak joinery work left natural off plane irons—viz., without any stain, polish, or filling in. We think oak joinery should be protected by something artificial, even if only filled in; but this will not be allowed. Can any reader suggest a treatment that will leave the oak to all appearances natural, and at the same time protect it?—A BUILDER.

[11899.]—**Damp-proof Course.**—In a villa which has been built nine years the internal plastering is breaking off up to about 2ft. from the floor, owing to the damp rising. I find the damp-course is of blue bricks set in cement. Can anyone advise me what is the best thing to do to put a stop to this?—A. S. C.

[11900.]—**Waterproofing Rough-Cast.**—A west random rubble-stone wall (18in. thick) rough-casted, in a most exposed position, is penetrated, in patches, during continuous drifting rain. Is there any solution which would not materially change the colour of the rough-cast which will render it rain-proof under all conditions?—ENQUIRER.

[11901.]—**Damp Wall.**—The 9in. walls of a house built some three years since, and facing south-west, are very wet, doubtless due to the porosity of the facing-bricks, for the dampness only occurs where these have been used. The brickwork has been treated with a patent solution, but without any benefit. Can any reader suggest a practical remedy? The tenant objects to have the outside plastered.—P.

REPLIES.

[11888.]—**Light.**—If the building erected be at the extremity of your land, the owner of the adjoining land can then demand a yearly payment for the enjoyment of such light and his own protection. Should there be any air space, such as a roadway or footpath, between your building and his land, which be yours, then you are not bound to pay him anything. Should your building be at the extremity of your land, as before mentioned, and you refuse to make yearly payment, he can then take steps to force you to block the light up, as it would depreciate the value of his land.—A. C. F.

[11888.]—**Light.**—If the owner of adjoining land has enjoyed an undisputed freedom from windows overlooking his land, I should advise "Mackenzie" to pay the 5s. as acknowledgment for the enjoyment of such light. Were there any windows overlooking the land before the warehouse was built? If so, you have probably a prescriptive right (if more than 20 years), and your neighbour cannot interfere with your lights; but if there were no windows overlooking, your neighbour is right in asking for a payment, or otherwise in blocking out your light, because should your warehouse acquire a 20 years' enjoyment of light over his land, you can prevent him from building to obstruct your light. He is only acting in self-defence. You do not state how long the land adjoining has been vacant, or whether there were windows overlooking it, or how long.—AN ARCHITECT.

[11889.]—**Protection of Iron.**—I should recommend "A. C. D." to use the "Angus" process, if possible. This is applied to the iron casting on all sides while hot. If it is an iron pipe, both the inside and outside should be coated. There are several new kinds of paint used for ironwork, but experience is wanted in estimating the value of them. Engineers now largely employ Dr. Angus Smith's process. For stable fittings, iron pipes, it has been used with good results. The ironwork is thoroughly scraped or cleansed from rust, and then it is dipped at a high temperature in a mixture of coal-tar, pitch, and linseed oil. This admixture coats the surface with a tough, bituminous, and firmly adherent substance, which does not peel off if the heat of the iron is maintained.—G. H.

[11889.]—**Protection of Iron.**—The cause of paint peeling off iron is due to the oxidation of the iron surface. Such oxidation, unless it occurs under a coat of paint, is due to the elimination of glycerine from the oil vehicle which has been used in grinding up the pigment. Glycerine is the part to which the fatty acids of the oil are united; these fatty acids combine more or less with the pigment, and the glycerine is set free. This free glycerine cannot escape through the dry skin of paint, so it is driven to the posterior surface of the coat of paint, and then comes in immediate contact with the metallic iron. As a consequence, instead of the coat of paint being firmly attached to the iron (like paint is when laid on wood), there is a layer of fluid glycerine beneath, which prevents the paint adhering. Hence, when the coat of paint has dried and hardened, it readily flakes or peels off. Besides this mischief, the glycerine causes the metallic iron to rust (*i.e.*, becomes oxidised), and, as a result, there is a film of pulverulent iron-rust beneath the coat of paint, which also decreases the adherence of the paint to the metallic surface. Red-lead paint is considered to be the best for painting iron surfaces, and, from a chemical point of view, it is so, because red lead, when ground up in linseed oil, combines with about ⅞ths of the glycerine which is eliminated, and thus decreases the amount of mischievous glycerine beneath the skin of paint. The nearest approach to a perfect paint for iron surfaces the writer ever came across is "Ferroror." This paint will adhere to any metal, and as a proof of its indestructibleness by chemical agents, the makers coat sheets of zinc with the paint, then steep the zinc in acids until the zinc is dissolved away, when the skin of "Ferroror" paint is left in a thin leaf or layer of paint, pure and simple.—H. C. S.

[11890.]—**Cement Tests.**—The results, published in the *Journal* of the Clerk of Works' Association of Jan. 28, that have been obtained from Portland cement mortar briquettes, may perhaps be of interest to your inquirer. The briquettes were made while the Portsmouth sewage outfall works were in progress to a specification by Sir Frederick Bramwell, Bart., F.R.S., and Mr. H. Graham Harris, M.Inst.C.E., the work of making them being intrusted to my care.—WILLIAM BAKER, 1, Chetwynd-road, Southsea.

[11890.]—**Cement Tests.**—"G." will find notices of recent tests in the BUILDING NEWS of the last year; but a good Portland cement of the requisite fineness, weight, and time of setting will be sufficient to insure strength or hydraulic properties. Consult Faija's or any modern handbook.—PRACTICE.

[11891.]—**Payments under Contracts.**—In some contracts payments are made at the rate of 75 per cent. from the date of delivery of goods, and the remaining 25 per cent. within, say, two months of the completion and delivery of the goods. The clause of conditions ought to state further that the castings and all bolts and fittings be supplied in accordance with the drawings and details and to the architect's satisfaction, who is to have power to reject any unsound casting or faulty material; all such defective materials and work so condemned to be replaced by the contractor to the architect's satisfaction. In default, the architect is to be at liberty to terminate contract, and to enter into any new contract for the completion of the work, and for the manufacture and supply of other castings, patterns, &c., without prejudice to any right of action by the employer against the contractor in respect of his default, and any amount due to him, or any material and plant on the site, shall be forfeited by him. These are the principal conditions required in any clause of the kind.—G. H. G.

[11894.]—**Fire grate.**—Our patent Manchester grates are just what your correspondent requires, having a warm-air chamber fed by inlet from inside, and provided with means for warming the room above. These grates have a firebox lined with firelogs. They are in use in buildings of every class throughout the country, and are the best grate of the kind we know of.—E. H. SHORLAND AND SON.

CHIPS.

The bust of Lord Randolph Churchill, subscribed for by members of the House of Commons, is now ready to be placed on its pedestal at Westminster.

A new high altar was opened at St. Alexander's Roman Catholic Church, Bootle, last Sunday. The altar, which is very elaborate, has been erected from the design of Messrs. Pugin and Pugin, at a cost of over £1,200.

An oak pulpit was dedicated, on Friday evening, in the church of St. Mary, Bickington. It has been erected to the memory of the late Mr. John Bickford, of Wrigwell, Newton Abbot, for many years churchwarden, and is the work of Messrs. Harry Hems and Sons, of Exeter.

At the meeting of the Colne Town Council on Tuesday the chairman of the technical instruction committee stated that it was practically settled that the provision of new technical schools and a public library should now be undertaken with the corporation's consent upon the amended plans submitted by Messrs. Woodhouse and Willoughby, Manchesteter, at a cost of £10,000. The site selected was in Albert-road. The minutes were confirmed.

The first new buildings erected for intermediate school purposes in the county of Montgomery have been opened at Llanidloes. The new school, which is situate on the banks of the Severn, in ample recreation ground, provides accommodation for 78 students. It includes an assembly-hall, an art-room with top light, large laboratory, cooking and laundry-room, &c. The contractor was a local builder, Mr. W. J. Jones-Meredith, of Llanidloes, the cost of the erection being £2,150, and the architect was Mr. H. Teather, of Cardiff.

LEGAL INTELLIGENCE.

RE DREW-BEAR V. GUARDIANS OF ST. PANCRAS.—The Hon. Mr. Justice Ridley has sent an intimation that he will give judgment in this case on Friday, the 11th inst. (to-day), at 10.30 a.m., at No. 2 Court, Queen's Bench Division.

A BUILDING ACT PROBLEM.—At Guildhall Police-court on Tuesday, before Mr. Alderman Truscott, Mr. Edmund Woodthorpe, district surveyor of the northern division of the City, appeared to a summons at the instance of Messrs. Mason and Co., of the Barbican, the building owners of premises at 19, Australian-avenue and 1, Cotton-street, who were dissatisfied with his decision as to certain work to be done upon the premises, which was alleged to be in contravention of the London Building Act, 1894. Mr. J. R. Atkin appeared for the appellants and Mr. Woodthorpe conducted his own case. Mr. Atkin said that Messrs. J. B. Coates (the Central Agency) were the occupiers of the basement and the first and second floors of 1 and 3, Cotton-street, and as the business expanded they wanted to take the ground-floor of No. 18, Australian-avenue, and, in order to do so, though these were originally separate buildings, they were desirous of having only one ground-floor. To this Mr. Woodthorpe had given notice of objection, arguing that the place was not fit for one occupation. Now, the only object of this particular section of the Act was protection against fire. He submitted that the taking of a room at 18, Australian-avenue would in no way increase the danger in case of fire, and the premises were adapted for one occupation, thus meeting the construction of the Act. Mr. Flint, A.R.I.B.A., was called, and said these premises could be made to connect, and were adapted for one occupation. The risk by fire would be no greater, with the iron door it was proposed to place in the room. Mr. Woodthorpe held to his original notice. The Alderman remarked that he had paid great attention to this matter. He had visited the premises, and had left nothing undone that would assist him in arriving at a right decision. He came to the conclusion that he must uphold the notice of the district surveyor, but did so with considerable regret. He would be glad to state a case on the point, as the Building Act seemed to him a difficult problem.

A BUILDER HEAVILY FINED.—At the Ipswich Police-court on Monday, Thomas Parkinson, jun., builder, Crown-street, was summoned for omitting to lay drains as required by the by-laws. Mr. W. Bantoft, town clerk, prosecuted on behalf of the corporation, while Mr. S. A. Notcutt appeared for the defendant. Mr. Bantoft said that the sanitary inspector, finding a nuisance existed at St. Margaret's Coffee House, directed certain alterations in the drainage of the premises. The carrying out of these alterations were intrusted to the defendant, who was to put down watertight drains in a bed of 6in. of cement. When the drainage inspector visited the premises on January 27, he was somewhat suspicious as to the depth of the cement. The workman stated that it was the proper depth, but the inspector, on putting a shovel down by the side of the pipes, found that there was not more than 1½in. of concrete. Finding also a pipe with a broken flange, he had two others taken up, with the result that he found they were broken to even a greater extent. The bad work was done under the living-rooms of the house. Mr. Bantoft mentioned that the committee were unanimously for a prosecution, and added that he was told to ask for the maximum penalty. Arthur Hicks, inspector of nuisances, and Geo. Aylward, drainage inspector, gave evidence in support of Mr. Bantoft's statement. Mr. Edward Buckham, borough surveyor, deposed to visiting the premises, while Mr. G. S. Elliston, medical officer of health, said the defect was a serious one, and likely to have an injurious effect upon the health of those who lived in the rooms. Mr. Notcutt, in expressing regret on behalf of the defendant that the pipes should have been laid improperly, said that defendant's father undertook to superintend the work for his son. Nothing was said in the by-laws as to the pipes being laid in a bed of cement, and he submitted that as the joints were watertight there was no case to meet. The magistrates imposed the full penalty of £5, with £1 2s. 6d. costs.

TIMBER MERCHANT'S ACTION AGAINST AN ARCHITECT.—Before Mr. Commissioner Kerr and a jury, the case of Houghton Bros. v. Clark was heard on Wednesday week. Messrs. Houghton Bros., timber merchants, 24, Devonshire Chambers, Bishopsgate-street, sought to recover the sum of £50 3s. 3d. (the action having been remitted from the High Court of Justice) for timber supplied to the defendant, Mr. J. W. Clark, Peterboro-road, Harrow. In opening the case, Mr. Bartley said that the sum claimed was the balance of about £150 for timber which had been supplied by the plaintiffs upon the defendant's authority. The defendant was an architect, and the timber was supplied for the purpose of being used at St. Kilda-road, Harrow, where the defendant was engaged upon the erection of certain houses. The defence raised, shortly, was that the defendant neither ordered the timber nor received

it, and that a man named Pay, the builder of the houses, was actually responsible, he having personally given the orders. The real point which the jury would have to determine was whether Pay was the authorised agent of the defendant for the purpose of ordering the timber. In June, 1896, Pay was an undischarged bankrupt, and the plaintiffs were his largest creditors in the bankruptcy. Consequently, they knew all about his position. Pay had an interview with the defendant in regard to the building of seven houses in St. Kilda-road, Harrow, three of which were to be built for a Mr. Smith, and the other four for a Mr. Cooper. They were to cost in all something over £2,000. The defendant suggested that Pay should enter into a contract to build the houses, the defendant agreeing to advance the money required, the profit to be divided. That suggestion was declined by Pay, who eventually agreed to build the houses as the defendant's manager. For some reason the defendant did not desire his name to appear in the matter. That being so, Pay ordered the timber and other goods needed, and the defendant had made payments on account. Now he had declined to pay the balance due. Mr. Pay, builder, Thurstgrove, South Norwood, was called, and said he was still an undischarged bankrupt. He called on the defendant in answer to a letter, and agreed to build the houses as his manager. The arrangement was that the defendant should finance him. The defence was that defendant never gave the man Pay any authority to pledge his credit, and he did not know that it was being done. The plaintiffs never communicated with him in any form to intimate to him that Pay was ordering the timber in his (defendant's) name. Pay had no business to do anything of the sort. Mr. Commissioner Kerr told the jury that the simple question was, "to whom were the goods sold?" The parties consented to take the verdict of the majority, which was in favour of the defendant on all points. Judgment was entered for the defendant accordingly, and his costs of the litigation were allowed.

Dispute between Architects.—Hoffman v. Halley.—This claim, heard in the Lord Mayor's Court on the 2od inst., was made by the plaintiff, an architect, to recover £400 odd from the defendant, also an architect, in respect of professional services rendered in connection with certain property at Barnes. In October, 1896, the defendant was desirous of erecting six blocks of mansions at Castelnau Estate, Barnes, and plaintiff was instructed to prepare plans. At the beginning of 1897 plans were prepared, and in respect of that item the plaintiff claimed 2½ per cent. on the estimated cost of the buildings to be erected (£3,500). The defendant expressed satisfaction with the plans, and requested the plaintiff to introduce a builder to carry out the work. A builder was introduced, and for that introduction the plaintiff claimed £150. The defendant afterwards saw the plaintiff, and said that he was very sorry, but he had altered his mind as to the class of property he proposed to erect upon the site at Barnes. The plaintiff afterwards prepared fresh plans in respect of the defendant's altered scheme, and, as the builder whom the plaintiff had already introduced refused to take up the matter, the plaintiff was asked to introduce another builder. That he did, and for that service he claimed £240, making altogether the amount claimed in the action £477 10s. The defendant ultimately refused to carry out the transaction, and had not paid the plaintiff for his services. During counsel's opening the learned Recorder (Sir Chas. Hall) suggested that a little temperate advice might be of use in putting an end to the dispute between brother professional men. A consultation took place between the parties, and defendant's counsel said the suggestion of the learned Judge had been accepted by his client. The defendant denied liability, but agreed to give the plaintiff a certain sum. There would be a verdict for the plaintiff for £100. The Recorder, in giving judgment, said he was sure the defendant had been well advised.

At Tuesday's meeting of the London County Council the debate was resumed on the proposal of the Fire Brigade Committee for a large increase in the stations and appliances of the brigade, at an estimated cost of nearly £200,000, which were agreed to, with the addition of a recommendation that the question of the method by which the fire brigade expenditure is to be defrayed be referred to a joint committee for consideration.

It is proposed to carry out the following schemes of church extension in the diocese of Chester:—St. Hilary's, Wallasey, a new church, in the place of the present building known as St. Luke's, Poulton; St. James's, New Brighton, a new church, to seat 700 persons, at Upper Brighton; St. Mary's, Liscard, a new church, to take the place of the old mission-house at Liscard village; St. John's, Egremont, a new church at the bottom of Trafalgar-road, near the Presbyterian Church; St. Paul's, Seacombe, the mission-rooms to be enlarged and a new church to be built near the board schools, Poulton-road.

Our Office Table.

A Blue Book, just issued by the Department of Science and Art, states that the estimated total expenditure on technical education during the year 1896-7 in England and Wales was £807,864. In addition, the amount raised by loan on the security of the local rate, mainly for the erection of technical and science and art schools, was £131,164. In Wales and Monmouth the estimated total amount devoted annually to intermediate and technical education is £42,861. In Ireland the estimated total expenditure during 1896-7, under the Technical Instruction Acts and the Public Libraries Acts, was £4,658. There are now throughout the United Kingdom 169 schools of science in connection with the department. In 1896 there were 220 schools of art and a total of 56,175 students, the fees paid by the latter amounting to £35,770, and the payments on results to £45,610. There were 1,540 art classes, with 90,018 students. The payments on the results of art examinations in art classes and science classes together amounted to £27,613. There were 20,161 elementary day schools, at which 2,250,070 children and 18,209 pupil-teachers were taught drawing, the payments on the results of their examinations amounting to £176,224. The whole number of persons who received instruction in art in some form through the agency of the department was 2,445,785.

We do not know what apparatus is employed, but apparently mechanical ventilation is not appreciated by the members of the Bristol City Council, where, according to the *Western Daily Press*:—

Mr. Abbot complained that they were being stifled, the ventilating fan not being in operation. The Mayor gave instructions for the matter to be seen to. Ald. Davies now asked leave to move the adjournment of the house until Tuesday next to the Guildhall. Really that council room was unbearable. Mr. Levy-Langfield begged to second that. Some confusion resulted. Complaints of the draughts were made by many members, and Mr. Pembery asked: Do you object, Mr. Mayor, to our wearing our hats? The Mayor: Order, order. Members sitting on that side of the room then closed the ventilators from which the cold air was descending. Mr. Pembery: Will you, Mr. Mayor, give instructions to stop the ventilating machine. I would rather stifle than be killed in this way. The draught is terrible. The Mayor: If you will kindly take your seat I will have the matter attended to. It was understood that the ventilating fan was then put at half speed and business was resumed.

If the choice is really between stifling and "draughts," the ventilation of the Bristol Council chamber is a problem still unsolved.

A few weeks since we published a view of Wells Cathedral, and we mentioned at the time that Messrs. Frost and Reed, of Bristol, were about to bring out a series of etchings of "The Church Towers of Somersetshire," from the hand of Mr. E. Piper, R.P.E. The first part of this publication has now been issued, with a descriptive introduction and notes written for the work by Mr. John Lloyd Warden Page. Wells Cathedral furnishes the frontispiece. The two remaining plates are in illustration of Axbridge Church and St. James's, Winscombe. The former is a cruciform building, and has a central tower, with a richly-pierced parapet and handsome south porch. The 17th-century plaster ceiling over the nave is an instance of incongruity which has found many admirers, the late J. D. Sedding among the rest. The 18th-century altar-cloth of tapestry is another treasure to be seen in this handsome church. Three miles from Axbridge is situate Winscombe Church, perched on a knoll below Shutshelf Hill, one of the spurs of the Mendips. The tower is somewhat too tall for its size; but it distinctly belongs to the district in the leading characteristics of its design, which much resembles that at Axbridge. It is 95ft. high, and the walls of the church, with the exception of the chancel, are enriched by pierced parapets, at once so general and so typical of the Somersetshire Perpendicular style of building. The three leading classes of tower design in Somerset are described as the Taunton, the Bristol, and the Wrington types. The etchings in the volume before us are well produced, and the folio will find a welcome in many an artistic home, particularly in Somersetshire, for the drawings are faithful records, nicely executed. The letterpress has been written by one who has a wide knowledge of the architecture of his county.

The fourth annual dinner of the heads of staff of the firm of Young and Marten, Caledonian Works, Stratford, took place at the Holborn Restaurant on Saturday, the 29th ult., with Mr. H. H. Marten, proprietor, in the chair, and Mr. E. Montague Edwards, general manager, in the vice-chair. Mr. Frank Marten and Mr. Ernest Marten were also present. Mr. E. M. Edwards, vice-chairman, stated, in proposing the health of "The Proprietor of the Business, and Success to the Firm of Young and Marten," that it was the toast of the evening, and he regarded it as an honour that he was privileged to propose it. He spoke of the achievements of the firm, and the name they had gained through supplying goods of sterling value at a nominal figure, and with promptitude and despatch. They had gained a position in the building world which was envied by many. The future success of the firm, he felt, was assured; the catalogue just completed, and now being distributed among the firm's *clientèle*, he considered, without speaking egotistically, was one of the finest and most comprehensive that had ever been attempted: eulogies from all parts were flowing in to headquarters, and the trade Press had spoken most encouragingly of it. The toast was drunk with musical honours. The chairman, in response, thanked Mr. Edwards for the kind remarks made in proposing his health, and also for the eulogistic expressions used in reference to the firm of Young and Marten, of which he had the honour to be the proprietor. Last year he expressed the hope that 1897 would be a record year, and he was glad to say the volume of trade done justified that hope, as they had had a considerable increase in their turnover. The chairman, in submitting the toast of "General Manager and Staff," said:—I have now to propose what I consider is the toast of the evening—that is, the health of your worthy vice-chairman and manager, Mr. Edwards, and the staff of Young and Marten. No general in the army could possibly have a more energetic and loyal body of men than I see around me this evening. I thank you most heartily for all your services, and I rejoice to think the same unity of spirit, respect, and esteem still exist between us. I assure you that all the good wishes I know you extend to me are heartily reciprocated by myself. —The vice-chairman, in replying to the toast of his health, and that of the staff, proposed by the chairman, said that he appreciated on his own behalf the kind words of encouragement which had fallen from the lips of Mr. Marten; he felt also that the staff would in a like sense appreciate them. Mr. Marten was at all times liberal in his treatment of difficulties, and an instance was cited which elicited cheers from those present.

CHIPS.

The Sheffield City Council agreed, on Wednesday, to purchase the undertaking of the Sheffield Electric Light and Power Company.

The Examiner of the House of Commons passed on Tuesday the St. Helen's Corporation Bill for the construction of tramways at a cost of £50,000, and the extension of the boundaries of the borough.

At the meeting on Tuesday of the Wirral Rural District Council, the building surveyor (Mr. Hughes) asked for the direction of the council as to the control of the sewers, a difference of opinion having arisen between himself and the road surveyor (Mr. Davies) concerning some sewerage works at Ness. Captain Congreve asked if it was true that the road surveyor was the contractor for the council in laying that sewer. The chairman said that was not so; the contractor was the road surveyor's son. The subject then dropped.

In consequence of a recent outbreak of diphtheria at the cottage homes of the workhouse at Worcester, inquiries have been made, and the result was reported to the board of guardians at their fortnightly meeting on Friday. It was stated that, owing to the condition of the drains at the cottage homes, which are of recent construction, the sewage was finding its way into the soft-water tank, as there was no trap to the pipe taking the overflow from the tank to the sewer. It was further stated that sewage a yard in depth was discovered in the soft-water tank. It was decided to ask the architects, Messrs. H. Rowe and Son, to meet the cottage home committee at once.

At a meeting of the South Shields Town Council held on the 5th of January last, the borough engineer, Mr. Matthew Hall, tendered his resignation after having held the office for nearly thirty years. In consequence of Mr. Hall's long service, the town council unanimously agreed to appoint him as their consulting borough engineer for a term of seven years at a salary of £150 per annum. Mr. Hall will commence private practice in the town as soon as his successor is appointed and can take up the duties.

MEETINGS FOR THE ENSUING WEEK.

Saturday to-morrow.—Edinburgh Architectural Associon. Visit to the Prudential Assurance Buildings, Jenner's Buildings, and the Stock Exchange, St. Andrew's-square. 2 p.m.

Monday.—Clerk of Works' Association. Annual Dinner at the King's Hall, Holborn Restaurant. 6.30 p.m.

Society of Arts. "The Principles of Design in Form," Cantor Lecture No. 1, by Hugh Stannus. 8 p.m.

Bristol Society of Architects. "Some Ancient Roman Buildings." Gaston Green.

Tuesday.—Society of Arts. "The Goldfields of Klondyke and British Columbia," by W. Hamilton Merritt. 4.30 p.m.

Institution of Civil Engineers. "Stability of Channels through Sandy Estuaries," by P. M. Crosthwaite. 8 p.m.

Wednesday.—Society of Arts. "The Protection of Industrial Property," by J. F. Isebin, M.A., LL.M. 8 p.m.

Edinburgh Architectural Society. "Normandy," by J. E. Forbes. Dowell's Rooms. 8 p.m.

St. Paul's Ecclesiological Society. "Some Cathedrals of Northern Spain," by Joseph Grimshire. 7.30 p.m.

Thursday.—Society of Arts. "The Plague in Bombay," by H. M. Birdwood, C.S.I. 4.30 p.m.

Friday.—A.A. Lyric Club. Cinderella Dance. King's Hall, Holborn Restaurant. 7.30 p.m.

Birmingham Architectural Association. "Siena and Baldessare Peruzzi," by Francis W. Bedford. 6.15 p.m.

CHIPS.

The Public Hall, Northampton, is being ventilated by means of Shorland's patent exhaust roof ventilators and special inlet tubes, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Kirkcaldy is to promote a Bill in the present session of Parliament for the construction of a new harbour and a line of railway to the new coalfields in the neighbourhood.

Mr. G. F. Bodley, A.R.A., has inspected the west front of Peterborough Cathedral, and his observations will be laid before the Restoration Committee at their next meeting.

The Bishop of Beverley unveiled and dedicated on Friday the fresco which has been put in the Altofts St. Mary Magdalen Church. A few months ago the church was renovated, and was also decorated. Mrs. Meynell Ingram, who built the church 20 years ago, has had the space for the chancel arch treated with a figure subject, at her expense, the subject chosen by her being the "Annunciation." Mr. Gustave Hiller, of Manchester, has designed and carried out the work. The reredos and the organ screen are also being decorated at the cost of Mrs. Ingram.

The county council of Argyle decided on Tuesday to erect a court-house adjoining the new police buildings at Dunoon. Mr. William Fraser, Dunoon, was appointed architect.

In giving judgment on Friday, in an action brought by Mrs. Mary Barnes, of 5, Orsett-terrace, Bayswater, against the trustees of the Scantlebury Estate, arising out of the drainage of her premises, Mr. Justice Wright said it was clear that the defendants employed as their agent a member of the Paddington Vestry, that the agent employed as his builder another member of the vestry, and that the work of the builder was inspected on behalf of the vestry by a son of the builder. He thought it was a reproach to the whole system of local government that such a state of things should exist.

Mr. Hayter, civil engineer, of London, sat at Manchester on Tuesday and Wednesday as arbitrator with regard to a claim for £15,000 made by the Manchester Racecourse Company against the Lancashire and Yorkshire Railway Company, being the estimated value of a piece of land on the racecourse belonging to the claimants, which is required by the railway company for the extension of their line to the Ship Canal docks. It was shown on behalf of the claimants that the alteration would block access to streets leading to the barrier wall of the racecourse. The claim was not only for the value of the land, but also for injuring the prospects of the racecourse company in view of the alterations. The arbitrator has reserved his award.

A vacancy has occurred in the surveyorship to the vestry of St. Martin-in-the-Fields owing to the present surveyor, Mr. Chas. Mason, A.M.I.C.E., having accepted a partnership in the old-established business of Messrs. Foster and Pearson, horticultural builders and heating engineers, of Beeston, Notts. Mr. Mason's resignation was accepted with much regret at the meeting of the vestry on the 3rd inst., he having held the appointment for the past eight years. The question of appointing a successor has been referred to the works committee for consideration.

Trade News.

WAGES MOVEMENTS.

Cardiff.—The whole of the masons in the employ of two large firms of building contractors at Cardiff—viz., Messrs. Turner and Sons and Messrs. W. Thomas and Co.—are on strike against the practice of sub-contracting. A number of hands came out early last week, and on Saturday the remainder laid down their tools.

Leeds.—For some time past the master builders of Yorkshire have had under their consideration the formation of a federation of employers engaged in all branches of the building trade, on similar lines to that which exists in Lancashire. While the arrangements for mutual protection are being carried out, the masters in Leeds are confronted by a batch of demands from their employés for increased wages and improved conditions of labour. The operative plumbers have tendered a six months' notice, which expires on June 1, for an increase in the rate of pay from 8d. to 9d. per hour, and for the alteration of the rules relating to the number of apprentices, work on out-jobs, and the hours of work in winter. The plasterers have asked for an additional penny per hour, and for several minor concessions. The Master Builders' Association offered the men an increase of a halfpenny; but as this was declined, the employers have now withdrawn the offer. The joiners have given notice, which will terminate on May 1, asking for an increase from 8½d. to 9d. per hour. The masons are also seeking a similar increase, and practically the only workmen in the building trade who have not asked for an advance are the bricklayers. A disposition exists on the part of some masters to give the labourers an advance, though it is not definitely known that the feeling is anything like unanimous.

Rugby.—At the beginning of January the carpenters and joiners of Rugby made application to the master builders of the town to increase their wages from 7½d. to 8d. per hour, and also that overtime at the rate of time and a quarter should commence after ten hours' work instead of eleven, as hitherto. They further asked that on all buildings lock-up places for the safe keeping of tools should be provided. The masters have agreed to the first and last of the demands, but decline to accede to that relating to overtime, and the men have unanimously decided to accept the modified terms.

The town council of Edinburgh adopted on Tuesday a proposal to erect public baths, including Turkish baths, in Portobello. The resolution to put up the vacant site adjoining the new North Bridge, in one or more lots, at a total upset of not less than £230,000 was again confirmed, on this occasion by a majority of 25 votes to 12, and thus now becomes an Act of Council.

The Corporation of London have recently sanctioned a scheme for the extension of the Art Gallery at Guildhall, at an estimated expense of £1,600. The plan, which has been prepared by Mr. Andrew Murray, the City Architect, shows the absorption of the ground-floor offices of the Land Tax Commissioners and the Mayor's Court in Guildhall-yard. The newly-acquired space will consist of three rooms connected with each other, and lighted with separate skylights, a connection with the existing galleries being made. The total floor area of the additional rooms is about 1,700ft. superficial. It has, however, been decided that no steps shall be taken to carry the scheme into effect until equivalent accommodation at the existing rent has been provided, in or about Guildhall, for the tax commissioners, whom the proposal would displace.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2251.
FRIDAY, FEBRUARY 18, 1898.

NEGLECTED FEATURES.

"STRIVING to better, oft we mar what's well," is a truth lost sight of in a good deal of what is done in the name of improvement and architecture. Those who regulate our buildings and thoroughfares have widened and rebuilt at the sacrifice of health and comfort. Our straight and wider streets have been purchased at the cost of diminished area and light. Again, in our architecture we have copied almost every style under the sun, but have been remiss in attending to those essential matters which contribute to use or comfort. Our studies have been concerned with the general features, while we have overlooked the special ones which have given the *raison d'être* of much of the design. Let us take two or three features, and see how often we have missed what should have been fundamental! In the planning of our streets, especially at their junction, the desire is seldom to do more than cut the corner off if the streets converge at a rather sharp angle, or to form a curve where four or more meet—in short, to make a "circus." For the purpose of facilitating traffic, and of making a large and imposing area, we can wish nothing better; but architecturally it leaves much to be desired. It is easy to strike a circle at the meeting of several streets. It would not be so obvious, perhaps, to form a square or oblong space at their intersection, though the arrangement would give the opportunity for architectural effect. Take a junction of five or six thoroughfares in which they meet at different angles. Right angle and obtuse corners would be formed, and some variety of treatment might be expected. In the case of two equi-angular streets crossing at right angles, the square could be treated with better effect, as at each of the four corners there would be a square formed between the lines of the streets produced and the fronts of the building. This space could be laid out, turfed, and planted. Each corner building would then make an indent of two frontages, which would help planning, especially of corner entrances. On the other hand, very little effectiveness in elevation can be got out of an inverted curve. What have our Ludgate, Holborn, or Oxford Circuses to show in architectural treatment? They are atrociously commonplace and uninteresting. Where efforts are made to emphasise the angles, they are often vulgarised by ugly-looking roofs or mansards, and by huge advertising posters. Let us look at the cities of the United States. Take Washington. The plan or scheme of laying out was engraved in 1792, and is the nucleus of the present capital. The city was planned by Andrew Ellicott, C.E., after the plans of Major Pierre L'Enfant. The principles of arrangement are described thus:—"The grand avenues, and such streets as lead to public places are from 130ft. to 160ft. wide, and may be conveniently divided into footways, walks of trees, and carriage-way. The other streets are from 90ft. to 110ft. wide. In order to execute this plan Mr. Ellicott drew a true meridional line by celestial observation, which passes through the area intended for the Capitol; these lines he crossed by another one east and west, which passes through the same area. These lines are accurately measured and made the basis on which the whole plan was executed." According to this principle the streets are oriented on true meridians. Few cities have such noble streets on rectangles some in diagonal directions. The streets absorb 43 per cent. of the whole area, and what is worth notice is that the plan of Washington shows square and oblong spaces at the chief centres, instead of circular. In Paris the effect of some of the recently formed boulevards, is to cut or to cross at acute and other angles the older streets, and to render it necessary to round off or cant the corners of the building where the intersections come. Take, for example, any of the newer thoroughfares formed under the late Empire, such as the boulevard Haussman, or the boulevard Malesherbes, which runs from the Madeleine in a north-easterly direction. They intersect many old and narrow streets, as do the Rue Lafayette and the boulevard Italiens. These thoroughfares, as far as possible, have been made to terminate at some important centre, like the Grand Opera House or the Madeleine. But the minor intersections have been left to take care of themselves. Architects have done their best occasionally to emphasise them by Mansard roofs or other features, and, owing to the uniformity of the house-fronts in elevation and style, the result is not so incoherent or jumbled as they are in many of our new streets.

Corners and re-entering angles have been more cleverly managed by our French and Belgian neighbours. They are adepts at angle towers and turrets. The angle turret of the old Hôtel de Ville, Bourges, and that of the Hôtel de la Tremoille, Paris, are good examples of corner treatments. The Chateau de Chambord is a noble Renaissance instance of a palace with corner towers, circular in plan, crowned by slate conical roofs of bold design, enriched by dormers and tall chimneys, which impart a picturesque skyline to the building. Angle pavilions and roofs are important features of this kind. Those at the angles of the Louvre are of dignified size and importance, with which our English imitations compare unfavourably. Compare, for instance, one of these pavilions with any similar work in London. Notice, for instance, the pavilion of the Place Louis Napoléon—its palatial dignity, projecting insular columns on each front, the massive and profusely-carved dormers which rise high on each front of the roof, the angles of the roof itself, and its ornamental lead cresting. There is no stint here. The details of leadwork are massive and handsome. Tall chimney-stacks in some cases flank the roof and rise to a considerable height, and are enriched by panels and sculptured ornament on the sides. In other of the angles of the Court of the Louvre, as in the re-entrant angles, we find circular turrets crowned by low, hemispherical cupolas barely rising above the attic. The Hotel de Ville is another notable building where the lofty roofed pavilions are made the most of. Besides one at each corner of this large block, two stand flanking the handsome centre which faces the Place in front; the angles of these are emphasised by octagonal turrets, which are terminated by pointed roofs of the same plan at the level of the main roofs of the pavilions. Of the recent palatial residences in Paris, the house of M. Gaillard in the Place Malesherbes, designed by M. Fevier, architect, gives one of the best examples of pavilion roofing; the end roofs are of a sharp pitch, and the two longer planes meet in a crested ridge, the front ends of corner pavilion being semi-octagonal, which form is carried through the roof, producing a picturesque skyline. The architect, M. Corroyers, has taken as a *motif* the Chateau de Blois. Comptoir d'Escompte, Paris, is an imposing termination to a street. Its façade is pierced by one large arched recess, and is crowned by a steep quadrangular roof and bell-turret in the apex; sculptured groups of figures adorn the angles and make a monumental building of considerable effect.

Both in our civic and domestic buildings the entrance is often the meanest part of the composition. We cannot say why it is that the English architect has so neglected this feature. Has it something to do with the idiosyncrasies of the English people—their reserve, if not coldness of manner? It may have. We must attribute the smallness and insignificance of the doorway partly, perhaps chiefly, also to our climate. A large doorway makes a cold house. There is something exceedingly petty in many of the entrances of even our public buildings. Look at any of those which ought to dignify the façades of the Mansion House, the seat of civic hospitality, or the great official departments in Whitehall; compare them with those of similar buildings in France or Belgium, like those of the City Hall or the Palais de Justice, Brussels, or the Hotel de Ville, Paris, or any of the great town-halls at Bruges, or Antwerp, or take the ecclesiastical domestic buildings. Have we anything to match the doorways of St. Maclou, Rouen; of the Madeleine, of St. Augustin, to say nothing of the grand portals of Notre Dame, Amiens, Rheims, &c., or that of the cheateaux, of which the Chauteau Azay-le-Rideau affords one of the finest examples? It would fill a page to give a list of some of the most notable in regard to their size and architectural embellishment, to the sculptural accessories which are so prodigally lavished on them in France, or the beautiful and exquisite woodwork and bronze relief of the doors. The jambs and arch also are often enriched by the most beautiful carvings, and the door-posts are ornamental features. In our modern buildings we attempt nothing beyond a plain moulded jamb or door-frame. The transoms and arch is bereft of any ornament. We can mention a few instances of buildings of a public kind in which the doorways are very narrow, and the arches and tympana are left quite plain or filled with poor sculpture in bas-relief. Recessed entrances and vestibules are scarce, though in our climate they afford the most welcome shelter from the weather. The *porte cochère* so common in the larger buildings on the Continent is a feature that has not "taken hold," and what we see of it in our streets is confined to a cast-iron structure of atrocious design stuck on the front in the most perfunctory manner. The ordinary West-End entrance porch, with its columns carrying a kind of tester roof, such as we see hundreds of in Cromwell-road, Kensington Gore, and Grosvenor-place, is one of the worst features of the Classic Revival period; some have been made useful by erecting a conservatory on the top. Happily it is disappearing, and in the newer neighbourhoods the porch is no longer a half-portico stuck on to a flat wall, but is made to assimilate with the architecture of the front. Still, there is a want of dignified design in many of these; some of them are more adapted for back than front entrances, and few show any desire to put the best design in this conspicuous and much-examined position, so as to ameliorate the condition of London street life.

THE DUDLEY GALLERY ART SOCIETY EXHIBITION.

THE Dudley Gallery Art Society opens with a show of water-colours of unequal merit. Of course we have a large sprinkling of commonplace and of the pot-boiling class. The President (Walter Severn) sends several works marked by his usual style and care. We have surely seen "Caligula's Arch, Anglesey," before—a wonderful conformation of natural pipeclay rock, which closely resembles a flat arch, with abutments of stone on either side. Mr.

...n a good delineator of ... The ... of ... is well ... still ... "Corn ... Ave Maria" (Glen ... are ... pictures, ... and awkward ... in its ... is interesting. ... the ... Mr. ... and ... "Evening ... (69). A ... of ... "Nook Reeds" (no number, 196), ... sunny sky, with grey ... and ... on the rippled water, is another ... Landscape studies are very ... In the hands of such painters as L. Bergen Bredt, we expect soft ... effects like the "Golden Hush of ..., where the tones are subtly ... and the dark outlines of the land... against a waning light, and his ... "On the Wye" (58), and "On the ... Wye" (262). Bredt also ... one or two sunlight effects. His ... "An August Afternoon" is ... the clear sunny effect one sees; a meadow with poppies, the distant village peering over the bright pasture. His "Tintern Abbey" is spoilt by the uncertain drawing of the ruins. Evangeline Jex-Blake, whose delightful sketches are always welcome, is charmingly truthful and delicate in her "Evening on the Palace Moat, Wells" (16); her old houses at "Lannion, Brittany" (28), and other sketches in Brittany, &c. Hubert Medlycott sends many drawings of Continental interest. His view of Antwerp Cathedral from Rue de Chevalier, "In Dieppe Harbour" (130), "Calais" (141), and a sketch of Amiens (268), show the present bias of this prolific painter of picturesque subjects. Reginald Jones's "Sunset Glow" (23) is broad and pleasing, and his "Grey Evening, Poole" (33), is distinguished also by breadth of colour, the mass of dark trees against sky and the grey tone are pleasing. Walter Hayes's "By the Sea" is a clever study in strong sunlight; a girl reclining on a portable chair on the sandy beach; a crested wave is seen advancing; but it is the sunlight effect that we admire. His "Le Quai aux Fleurs" (45) is a brilliant piece of flower painting. Miss Maud Turner's very nice study of a little girl, "Peeling Apples" (31), is good in drawing and colour, and pleasant colour is seen in Fred. Jas. Aldridge's "A Strong Breeze" (39). We must pay a tribute again to the skilful drawing, accurate and delicate, of Chev. S. Campagni, who sends half a dozen subjects of architectural interest, "Stylobate of the Temple of Antoninus, &c., Forum, Rome" (42), is a delightful piece of perspective drawing and charming colour; the bases of the columns on the massive podium, which only we see, are painted with subtle skill, the roughness, chipped base mouldings, and texture of the stone are all here, with all the charm of colour. "In the Campagna" (34), the ruins of the Forum and its delicate bas-reliefs (78), a "Pelasgic Altar, Bellegra" (99), the "Peristyle of the Temple of Faustina" (190), and a sketch of rock (275) are other works by this consummate painter of Roman remains. Lexden L. Pocock's imposing "Forest Glade" (51), a hollow beech trunk and the flickering sunlight through the foliage is very careful and dexterous, though the particular tint of green is open to question. Mrs. Murtagh J. Moberly, in her "Little Woodwinder" (58), has given a nice head, and the colour is pleasing. J. Maud Peel, in "The Lost Lambs" (67), shows her favourite theme; there is sweetness in the colour and harmony. We also notice some delicate harmony and colour in her "Fishing Boats" (87). Another lady painter of promise is Rose Douglas; her "Water Meadow" (83) is very fresh. No. 68, "On the Qui Vive," by Walter Bothwell, is also of merit. Tameness of ... is often associated with careful drawing, as in Nos. 75, 80, and 82. In ... "In the Garden," R. S. Standen ... mistakes minuteness of finish for inspiration and true sentiment. It is a pity ... painters so devote their talents to such trivial objects as "afternoon teas" and other ... E. Dunsford's "Hush of Evening" ... is ... Lexden L. Pocock sends several pleasing subjects. "Great Expectations" (90) is one of them. Miss Agnes J. Hall (107) is broad and truthful in colour in her "Evening, Wilberswick," and Miss Maude Turner's "Waiting" (104) is gracefully drawn. Miss Margaret Bernard is indomitable; she sends half a dozen sketches, Nos. 115 and 122, sketches on Bournemouth Sands and on the Thames, are sharp and bright, and her dexterous touches and high lights tell; but her view of "Houses of Parliament" is weak in proportion and drawing. Harriet Skidmore in the "Breakers" is also promising. Another lady artist, Mrs. E. Heathcote, sends a nice study of a girl's head in profile, the tone being taken from the rich auburn hair. No. 139, "On the Moors," "Fishing Boats, Etaples," by Rose Douglas; an admirable drawing by David Green, "Wintry Weather," fisherfolk watching a rough sea breaking over wall of quay (144); R. Wane's fresh blue sea (158), and Miss Rudd's slight but effective sketch of Dunwich (157); S. C. W. Roscoe's "A Peep of the Dart" (152) very mannered, a fault which we notice in Sir W. Eden's woodland (162), No. 177, are other subjects. Rich colour and clever treatment are to be seen in Albert Stevens's "On the Moors, Bettws-y-Coed" (179), and the drawings of J. Carlisle of Kingsworthy and Avington, and N. Benett of Christchurch, Hants, and of Frances E. Nesbitt of "Harbour, Whitby" (211), and a few on the screen may be mentioned. Quite one-half the pictures might be spared with advantage.

A COAT OF PAINT.—II.

In the last article it was shown how the several coats of paint are composed and used on painting a good quality job in painting wood. In this article are considered the physical and chemical changes that occur in the paint compound that has been spread on the wood. It will be noticed that the ingredients which have been used are linseed-oil raw and boiled, pigment, white and red leads, turpentine, driers (a complex compound), and knotting (also a complex compound).

Let us now consider the physical and chemical nature of these bodies. The linseed-oil, when in combination with red-lead, unites therewith to form a very hard quick-drying paint, because this oxide of lead unites with the fatty acids of the oil, and also imbibes the glycerine base of the oil, and by this means the compound becomes a hard, quick-drying one.

In the case of the white-lead, a similar action does not occur. What does take place is this:—The linseed-oil becomes split up into its constituents, fatty acids and glycerine—and the white-lead, which is a mixture of hydrate and carbonate of lead, unites with these bodies only to a small extent, except in the case of the linoleic acid that is separated from the linseed-oil. These two bodies (white-lead and linoleic acid) unite to form linoleate of lead, a substance that is soluble in water. Meanwhile, the other constituents of the linseed-oil are more or less in a free state, the glycerine particularly so, as it will not combine with any of the bodies present. As a consequence, it is only the compound of linoleate of lead that dries to hardness: but the hardening of this body is retarded by the presence of the glycerine, which will imbibe moisture from wherever it can obtain it.

In the case of boiled linseed-oil that has been converted into a kind of varnish which will dry up into a tough, elastic mass. Turpentine is a volatile fluid chiefly, but it leaves a small residuum of resin behind after the volatile portion has flown away. The driers consist of a mixture of litharge and other lead salts with linseed oil, and in some cases of borate or sulphate of manganese, or of zinc with zinc oxide and linseed oil. These compounds assist the drying quality of the paint with which they are mixed, because they either supply the linseed oil with oxygen from itself, whereby it is enabled to become converted into a hard, tough, elastic skin; or else the drier acts catalytically—that is, it absorbs oxygen from the air at a quicker rate than what linseed oil does: and as it does so, a portion of the imbibed oxygen is conveyed direct to the linseed oil. It should be explained that the "drying" of linseed oil simply consists in its fatty fluids—chiefly the linoleic acid—being oxidised.

The composition of "knotting" was explained in last article.

Now, all the above reactions are legitimate ones—such as should always occur in the paint compound during its conversion from a soft, semi-fluid state to a hard, tough, impermeable skin or coat of paint. There are, however, many factors—atmospheric and chemical—which interfere with these legitimate reactions occurring, and it is this interference that causes a coat of paint to exhibit the vagaries of peeling, blistering, chipping, crumbling, &c., subjects which we will now consider. In the first or primary coat, the presence of the red-lead causes the thin coat laid on to dry very quickly, and practically form a thin layer of a hard cement-like body on the surface of the wood—one which will not allow the wood to absorb oil from the coats subsequently put on. If the primary coat consisted of all red-lead and oil, an impenetrable buffer would be found between the absorbent fibres of the wood and the remaining coats of paint put on; but the amount of red-lead is so small, and the amount of white-lead so large, that this impermeable coating is not sufficiently thick enough, as the white-lead allows a large proportion of soluble linoleate of lead to be formed, and it is this linoleate which allows future mischief to occur in the paint.

In all the subsequent coats there is this soluble linoleate of lead, together with glycerine which is eliminated from the oil. Now, as the coat of paint dries first on its exterior surface by reason of that portion being immediately in contact with atmospheric oxygen, the soft mass of lead linoleate has a difficulty in hardening, and the glycerine has no means of escape through the exterior surface of the paint. As the drying and hardening of the paint deepens, this glycerine is driven further and further into the interior surface, and, as we have seen the primary coat is not impermeable, the glycerine is brought into immediate contact with the wood, which, being of a porous nature, imbibes the glycerine.

Now the production of blisters is on this wise:—When the glycerine is driven to close proximity to the wood itself, the latter material, being porous, will absorb it, and as glycerine will mix with water in any proportion, any moisture that has not dried out of the fibre of the wood will unite with the glycerine. Now when the wood is subjected to alternations of temperature, particularly the sun's heat, then water will be gathered up into patches beneath the still soft paint and form the origin of the future blister: this is easily proved by pricking one of these newly-formed blisters which the paint covers. If it is soft, an aqueous fluid will exude, which, if tasted, will be sweetish to the taste (glycerine is a very sweet fluid). Now, as there is no escape for this watery fluid through the paint, its only source of escape is through the wood, which will absorb it as soon as the wood contracts with a colder temperature. As a consequence of this absorption, paint which has been bulged up by the watery fluid will not regain its former level, but remain bulged up, covering a void space. If you chip off the paint forming a dry blister you will see the plain wood beneath, or, at most, the priming coat, through which the watery fluid has been absorbed (owing to the presence in the priming coat of the soluble linoleate of lead). Now, if the wood has been subjected to the fierce rays of the sun, the paint forming these blisters will harden and dry at a quicker rate than the paint which still adheres to the wood, and, as a consequence, they become dry and brittle before the other coats of the paint have completely hardened, but still remain elastic. As a consequence, the slightest friction, rubbing, or vibration of the woodwork will cause these brittle patches of paint to fall off, and expose the wood beneath.

If the wood is a hard non-porous one, or if the primary coat has dried so hard as to prevent the

glycerine that has been eliminated from the subsequent coats of paint penetrating to the wood, the glycerine will be gathered up underneath the paint in a great number of small blisters, and these, if pricked while soft, will allow a sweet liquid to exude, which is the glycerine without the presence of water, but contaminated with other fluids that have been evolved during the decomposition of the linseed oil during the drying of the paint. These innumerable small blisters, when dry and brittle, will give the appearance to the paint of being pock-marked when they are rubbed off. It is only when the glycerine can absorb water from the wood fibre that large or big blisters result. The remedy for preventing the formation of blisters is to allow each coat to become more than half-dried before laying on the next coat; but the best remedy of all is to dispense with the use of driers in the paint and use a varnish vehicle instead, or else have the pigment ground up in an oleo-resinous one, such as was mentioned in the article on "The Vagaries of Paint."

THE PEELING OF PAINT

is caused by the non-adherence of the second and subsequent coats to the wood or the primary coat. This non-adherence is caused by the inability of the material on which the paint is spread to amalgamate or partially unite with the paint, and it is also sometimes caused by a too-quick drying of the coats of paint, whence the paint skin is not sufficiently elastic to retain its adherence, but, by drying up too rapidly becomes brittle, and then peels off the wood.

CRACKS IN PAINT

are caused by several influences. Thus, if the paint is exposed to a direct heat in one or two particular spots, leaving the remaining portion of the painted surface exposed to the normal temperature, the paint which is under the influence of the greater heat will dry at a greater rate than the other portions, and, as a consequence, contract or be drawn away from the slower-drying paints, and then fissures, long or irregular cracks, will be caused in the paint, leaving the primary coat on the wood itself exposed to view. The remedy for this defect is to allow the painted surface to dry at a uniform rate. This, of course, cannot always be effected, as, for instance, where there is a direct draught from a door, window, or other opening on to the wet paint; but a great deal may be effected as a remedial agent in employing a quick-drying varnish-paint, which, by its uniform rate of drying, will not allow the paint to contract or expand. Of course, such a paint should be shaded from the direct influence of the sun's rays.

Pitting in paint is often caused by the presence of water in the paint. This water is often introduced into the paint-pot by not having properly freed the brushes from the water in which they have been kept while not in use. It would be much better to keep paint-brushes in turpentine when not in use. Another cause of the presence of water is due to the paint having been spread during moist or damp weather, or on a damp surface.

One frequent cause of a paint coating, peeling or pitting is the fact of its being spread on green wood—*i.e.*, wood from which the sap has not been completely dried out. This sap is more or less acid, and as it dries out of the wood by rising to the surface, it prevents the paint adhering, and so causes one or the other of the above phenomena.

So far we have not yet touched on the employment of adulterated materials, but have considered that the best and purest materials procurable have been used on the job. When, however, the materials have been adulterated, or substitutes for linseed-oil or turpentine have been used, "confusion worse confounded" reigns supreme as regards the "deviltries" that may occur in a coat of paint. One example will suffice. If, as is frequently the case, benzine, or some other quickly-evaporating fluid, has been used as a vehicle in which to grind or mix the pigment, such volatile fluid will evaporate and leave the solid particles of pigment in a powder or non-adherent pulverulent mass. In other respects, such a fluid will leave the paint dull and bereft of brilliance.

The chemical and physical changes to which a paint is subject by the immixture of spurious materials are too numerous to be further mentioned here. They are, in fact, important enough to demand an article to themselves.

There is one particular body the influence of which has not been discussed in this article, and that is the legitimate and abusive use of "driers." These compounds are very inimical in a paint; but the vagaries their presence engenders are too varied to be now discussed, and can be more suitably treated in the article dealing with substitutes, adulterations, &c., used in paints, vehicles, and pigments.

H. C. Standage.

SEWAGE PURIFICATION: THE SALFORD EXPERIMENTS.

MR. H. GILBERT WHYATT, A.M.I.C.E., deputy borough surveyor for Salford, read a paper entitled "The Present Position of the Sewage Purification Problem," at a meeting of the Sanitary Inspectors' Association (Lancashire and Cheshire Branch) held at the Royal Technical Institute, Salford, on Saturday afternoon, the 12th inst. Mr. J. T. Shawcross presided, and there was a large attendance. At the outset of his paper Mr. Whyatt remarked that it would be possible to describe in two words the present position of the problem; he proposed, however, to take a comprehensive view of the situation. The first inquiry by the Local Government Board was undertaken over forty years ago, a second was commenced in 1865, and a third in 1868. The third inquiry was the most important, as it was directed to the rivers of typical manufacturing districts in England and Scotland. In their third report the Commissioners said they considered that the right way to dispose of town sewage was to apply it continuously to the land, as it was only by such application that the pollution of rivers could be avoided. Referring in detail to the first report of the 1868 Commission, which dealt specially with the Mersey and Ribble basins, Mr. Whyatt spoke of the importance then attached to the manurial value of sewage sludge. Eventually this idea of manurial value was dropped, and experimenters would have been content with a chemical treatment which would meet the remaining difficulties; but their efforts were futile, and now only "patentees" had any hope of success. The "international" and "electrical" systems were brought forward, and the former had been successfully adopted in many places. The "electrical" was very successful also, but its expense was great. Mr. Whyatt dealt at considerable length with the process of treating sewage by biological agency, which, he said, dated no further back than 1882 or 1884, and about which the report of Mr. W. J. Dibdin (late chemist to the London County Council) and Drs. Sorby and Dupre clearly established the position that the foul matters in sewage were ultimately destroyed by the action of living organisms—the process being biological, and not chemical; and it was when these organisms were not allowed full scope to exercise their beneficent life-action that putrefaction resulted. Scott Moncrieff, Lowcock, and others had conducted experiments on these lines. In Salford, experiments had been going on for about ten years, and much time had been spent on various patented processes, chiefly chemical. About five years ago the committee turned their attention to artificial filters. The first set of six filters were arranged at three heights with a ventilation floor between each 20in. of filtering material. Two filters were composed of gravel and sand, two of coke breeze, and two of cinders, and very good results were at once obtained from them all. Cinders proved the best filtering medium. The experiment was continued for 15 months at an average rate of 500 gallons per square yard per day, with very successful results. It was then wished to prove the advantage of a preliminary "roughing" filter and varying degrees of aëration: and this experiment was still going on. The filters were tried at varying rates of flow, and so long as a filter did not choke up the effluent was uniformly good. If the filter choked up it was found that by leaving it idle for a week or two it would recover itself, and again take the sewage perfectly. In 1895 two filters 8ft. deep were made, in order to ascertain whether a deeper mass of filtering material would deal with a larger quantity of effluent, and it was found that while a 5ft. filter would deal with 500 gallons per yard daily, an 8ft. one would deal with 800 gallons. In 1896 the filters were run practically continuously for 12 months at the rate of 1,000 gallons per square yard per day, then for a short time at 500 gallons, and now at 700 gallons, the only rest being for a short time daily, whilst the small pump supplying them was cleaned. Contrary to expectation, they stood that severe test. In place of the sprinkling troughs, spray jets were now used. The surface of the filter was perfectly open and water was not allowed to collect anywhere. There had been no appreciable growth of the brown sewage fungus since 1895, and the bacterial filters had been protected by a "roughing" filter of fine gravel. Some 25 precipitation experiments had been tried, and the effluent of all passed through the bacterial filters with good results. The Corporation had resolved to spend £80,000 in altering the works and laying down bacterial filters; but the Local Government Board had refused its sanction unless the corporation included a sum to cover the purchase of land over which the filtered effluent might be turned and further purified. Mr. Whyatt considered the time had come when the Local Government Board should be roused from its state of "agnostical immobility" and take upon itself to examine whether there was the efficiency in bacterial filters that was claimed for them. Mr. Whyatt was accorded a vote of thanks at the conclusion of the proceedings.

EXAMPLES OF GREEK AND POMPEIAN DECORATIVE WORK.*

A COLLECTION of measured drawings of Greek and Pompeian work is sure to find a welcome by all who value the subtle and the refined. The author, Mr. James Cromar Watt, visited the neighbourhood of Athens, Palermo, and Naples some years ago, and these drawings appear as the result of his study. The plates, which number 60, form a large folio volume, and the designs, mouldings, and ornaments have been drawn chiefly to a full size and photographed the same size as the drawings, by which means accuracy of detail has been insured. For the same reason shading has been omitted in many instances. The letterpress is limited to occasional notes in the list of plates: but these are in some cases quite inadequate. Many of the details are extremely delicate and beautiful. The first plate, for example, gives us details of the pedestal of white marble of the Niké of Paeonios, Olympia, erected about 420 B.C. The cornice and base of the triangular shaft are refined and simple in contour: the figure which surmounted the pedestal is from Grüttner's restoration. The sections of cornices and base are given to a full size. The white marble cornice from the National Museum, Athens, showing a bold cima-reversa, with leaf enrichment and honeysuckle at the corners, is a fine profile. The incised and moulded ornament from the Acropolis, in white marble with traces of painting in Plate 4, is wanting in the colour: the position and height are not stated, without which the colour of the ornament is greatly lost, and the same criticism applies to other examples in the volume, as in the full-size painted ornaments from cornices in terracotta, Olympia (Plates 12, 13, & 4), very beautiful developments of painted enrichments. The ornament is made up of the Greek zigzag, scrolls and frets, the darker parts being in one case purplish black, the lighter olive green on pale buff. One honeysuckle enrichment is buff-coloured on black ground. The cyma, in painted terracotta, from the Leonidaeon, Olympia, is a fine example. Very graceful and delicate is the white marble ornament honeysuckle from the Erechtheion, Athens, plates 6 and 7, probably friezes. The terracotta antefixæ from Athens (plate 17) and the examples of steles (plates 19-22) are fine. Among other instances we may mention the beautiful capitals in marble from the Propylæa, Eleusis, from the National Museum, Athens, from Olympia, Palermo, and Pompeii. Some of these are Ionic, and of good outlines: one is a simple volute from Olympia (plates 28, 30), and some more elaborate in sandstone covered with stucco. The Pompeiian capitals in grey marble, shown in plate 36, are very elegant adaptations of later Greek or Roman character, a Roman variation of the Doric type. The author gives several very beautiful drawings of bronzes, candelabra, from the Museo Nazionale, Naples: stands, vases, and lamps, which will be found full of suggestion for designers in metal-work. These are admirably and feelingly drawn, and are reproduced from the pencil drawings.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—XVII.

By an Assoc. Inst. Elect. Engs.

CONTROLLING DEVICES.

WHICHEVER system of wiring be adopted in an electric-light installation, it is essential that means should exist for controlling every circuit and appliance (lamps, motors, &c.) receiving electricity. The consumer requires, for instance, means for turning *on* or *off* any, or all his lamps whenever he may desire. The insurance companies also demand that means should exist for instantly breaking the circuit should an abnormal current traverse any circuit, or undue heat be produced. For the former, switches are used, and these, of course, are worked by hand; for breaking the circuit, if undue heating is produced, automatic devices are necessary, and these are known as *cut-outs*, which may be electro-magnetic appliances, or simply fusible cut-outs.

Switches.—A switch is a device introduced into an electric circuit for *closing* (making contact) or *opening* (breaking contact) the circuit readily and quickly. They are sometimes also used for diverting the current from one conductor to others. Since there are many ways in which a circuit may be made or broken, it is evident that there will be a large variety of switches in the

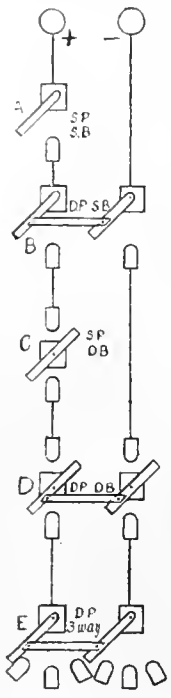

Fig. 48.

market, and all that will be done in these notes will be to explain some of the principles employed, to point out the good and bad points of switches, and also to point out how they should be used. A glance at the catalogues and price lists of the numerous makers will give some idea of the types in common use. In all cases, a switch consists of one or more movable contact pieces, two or more connecting terminals, an insulating handle and base, and the necessary connecting screws. In some cases carbon and sparking plates, covers, adjusting screws and keys are added.

To make and break contact, motion may be given to a pivoted or hinged contact bar, or by inserting or removing a plug. And since switches are used to control the main branches, the submain branches, lamp branches, and the lamps, they may be designated main, submain, branch, and lamp switches. It is also usual to denote the size according to the current they are designed to carry: thus there are 5, 10, 20, 25, 50, 75, and 100 ampère switches; and, as we shall presently see, it is essential that the dimensions of the various parts should correspond to the current they have to carry. Before explaining the various principles employed, it will be well to point out the special requirements of a good switch. When we remember that the introduction of switches and fuses introduce leakage points, and bring down the value of the insulation of the circuit, it is evident that it is an important matter to use none but the best switches.

Essential Qualities of a Good Switch:—

(1) It should be of ample size, so that no overheating can take place at the point of contact or

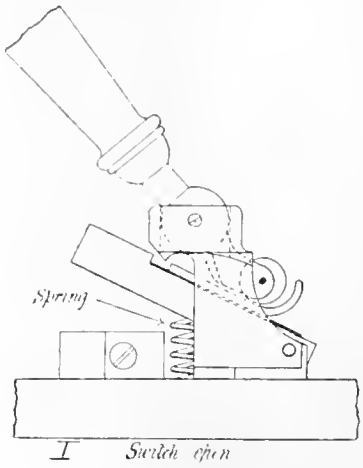

Fig. 49.

elsewhere. It should not carry more than 500 ampères to the square inch at any part.

(2) It should be solid, and have large contact surfaces. The contact surfaces should have twice the cross-sectional area of any other part, and the contacts should be intimate and adjustable.

(3) Contact surfaces should not deteriorate quickly, and they should be kept clean; rubbing surfaces under pressure clean themselves.

(4) There should not be too many parts or contacts, and they should be smooth-working.

(5) The *make* and *break* should be long, and be made easily and quickly, and when motion has

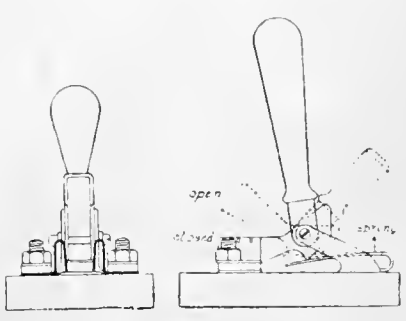

Fig. 50.

been given to the moving parts, they should not be able to take up an intermediate position between *on* and *off*, nor to take up a position so that a permanent arc can be formed. The permanent gap at *off* should be of sufficient length to prevent arcing.

(6) The current should not pass through the pin, pivot, or axle on which the moving arm works.

(7) The base and handle should be of good insulating and incombustible material. They should not readily condense moisture, nor facilitate the accumulation of dirt and dust.

(8) They should be protected from dirt and dust, and the cover should also be of incombustible material, and should preferably be either made or lined with non-conducting material. The covers of all switches should be kept clear of all the internal mechanism.

In connection with the requirements of a good switch, we may add the following rule, taken from the Institution of Electrical Engineers' wiring rules:—In order to ascertain that switches comply with the above requirements, samples should be selected from each pattern and size used, and should be tested at an E.M.F. and current 50 per cent. in excess of that which will be used on the circuits for which they are intended."

The method of using switches will be evident from Fig. 48, which is diagrammatic.

All kinds of switches are divided into two broad classes, the *single-pole* (S.P.) and *double-pole* (D.P.), and each of these are sub-divided into *single-break* (S.B.) and *double-break* (D.B.) switches. There are also *two*, *three*, or more way switches called *multiple-way switches*. Each of these kinds are shown diagrammatically in Fig. 48. At A, for instance, there is a single-pole, single-break (S.P., S.B.) switch; at B a *double-pole*, *single-break* (D.P., S.B.) switch; at C a *single-pole*, *double-break* (S.P., D.B.) switch; at D a *double-pole*, *double-break* (D.P., D.B.)

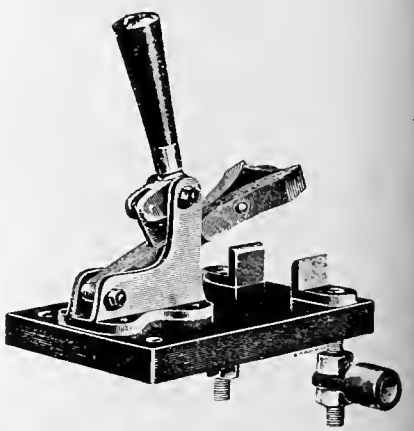

Fig. 51.

switch; whilst at E there is a *double-pole*, *multiply-way switch*.

The function of a single-pole switch is to open or close one, and only one, lead; but, as in incandescent lighting, the parallel system of distribution is universally adopted, and the lamps connected in parallel single-pole switches are seldom used, except as lamp switches. In no case is it advisable to control a circuit supplying current for more than four lamps by means of single-pole switches, as it is much more satisfactory to break both mains at once. In all cases where the supply is taken from the company's mains double-pole switches should be used, as they cut both the mains completely off when the lights are not required. A single-pole switch, of course, breaks the circuit and cuts off the light; but the whole of the house wiring is in connection with the mains, and the insulation is consequently subjected to the same strain as when the current is on. A double-pole switch, on the other hand, completely cuts off the house mains from the supply mains, and thus prevents any possibility of mishap occurring. To be satisfactory, double-pole switches should have the opposite ends of the moving bar thoroughly insulated from one another, and the two ends should break contact at the same instant, so as to prevent arcing. As is well known, sparking takes place whenever a circuit is broken; especially is this so when the circuit contains some electromagnetic appliance, in which case the spark is very intense, and if the length of the gap between the contact surfaces is too small, there is some possibility of an *arc* being formed; and as the temperature of an electric arc is very high, the metal is fused and the surfaces are damaged, in addition to which there is some

possibility of fire resulting should any inflammable material be near. To prevent this excessive sparking, double-break switches are recommended, by which means a main is broken in two places at once, and the sparking subdivided.

Good contacts require pressure, and in many cases springs are used for this purpose, and to give the motion of the lever or the bar a quick action. Figs. 49, 50, and 51 will give some idea of the principles involved in the construction of switches so as to produce a good rubbing surface and a quick snap action.

Figs. 52 and 53 illustrate multiple-way switches, the former of which is a simple two-way switch.

The *ring* or *claw* pattern, represented in Fig. 54, is a very effective switch. From the figure

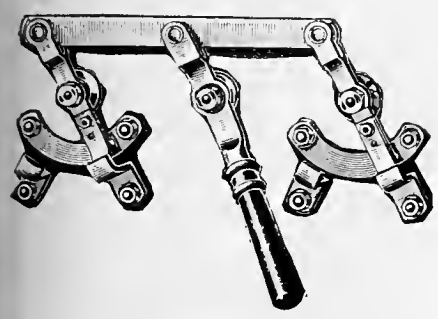

Fig. 52.

it will be noticed that the movable contact-bar passes between a slit in a piece of stout brass strip bent so as to form almost a circle. The ring is provided with a bolt passing right through the ring, by which means the grip may be adjusted so as to compensate for wear. The stiff working of the switch produces a kind of snap action, because there is a sudden release when the movable bar passes out of the ring. By snap action is meant that rapid movement or quick action which takes place when the spring is able to exert its power after the contact bar has moved through a certain distance. It is very essential that switches carrying large currents should possess this action, as it reduces the effects of sparking to a minimum.

In Fig. 54, II. the sweating socket, or thimble into which the conductor is soldered, is shown, and for large conductors this is the only satisfactory method of connecting the cable to the switch. For small lamps or branch switches the wires are often fastened by means of set-screws.

For the interior conduit and concentric systems

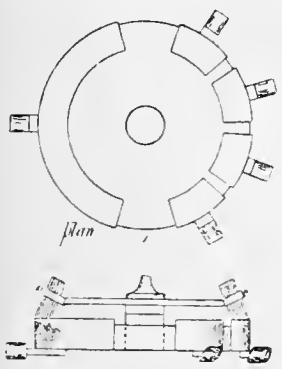

Fig. 53.

of wiring special switches are required, and as they are generally of the box form, they are known as box-switches. In the case of the concentric wiring, double-pole switches are dispensed with, since the second conductor is permanently earthed; consequently the switches used in this system are single-pole switches, and they are always connected to the inner conductor. They are, moreover, surrounded and insulated from a metal box, electrically and mechanically connected with the outside sheath of the conductor.

A form of switch not previously referred to is the *wall plug*. It differs from ordinary switches in that the movable part is completely removed from the base when the light is not required. Contact is made by two projecting pieces which fit into tapered recesses. They are used in connection with reading and other portable lamps.

Main switches should be placed close to the generators if the supply is generated within the building, or at the transformer if transformed within the building, or at the point of entrance of the conductors into any building supplied from an external source.

When all the three wires of a three-wire system are brought into a house, the member of

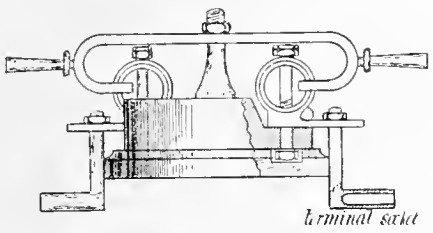

Fig. 54.

the switch connected to the middle wire must not make contact later or break contact sooner than the other two members; preferably the middle member should make contact *sooner* and break contact *later* than the other two members. Single-pole switches should not be on the middle wire of a three-wire system. In a five-wire system the same principles will apply.

Fuses and Cut-Outs.—The term "cut-out" is generally reserved for an appliance which *automatically cuts out* or *breaks* the circuit with a given excess of current, and a number of such devices depending upon electro-magnetic action are on the market, and may be relied upon to answer readily and quickly. They are, however, more particularly adapted for switchboard and

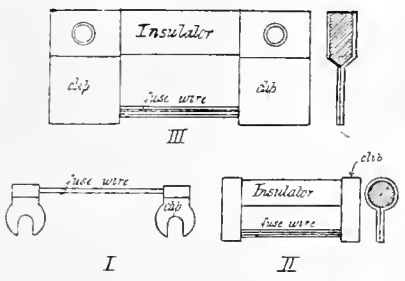

Fig. 55.

generating station work generally than for house fittings, in which case fusible cut-outs are used. A fusible cut-out, or simply a *fuse*, is a safety device, consisting of a short length of wire or strip of metal introduced into electric lighting circuits by being placed in series with a conductor to guard against the production of a dangerous excess of heat in any of the conductors, due to an abnormal increase of current. They should, therefore, be of such material and dimensions (length and sectional area) as to fuse, and thus break the circuit when the current increases by a given percentage. Their function is to *prevent* undue or dangerous heating of the leads, or the destruction of apparatus (lamps, &c.)

When we remember that every conductor has some resistance, and that this resistance which is offered to the passage of electricity manifests itself as heat, and that the heat produced is

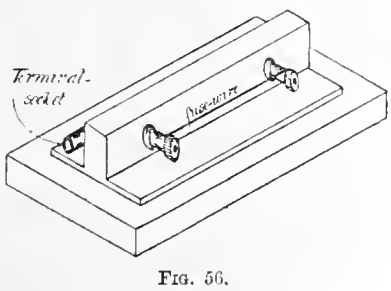

Fig. 56.

proportional to the square of the current, it is clear that the conversion of electrical energy into heat energy takes place very rapidly, and that an increase in current strength means a large increase of temperature.

Under ordinary circumstances, the sizes of the conductors are such as will prevent undue and dangerous heating; but as short circuiting may result (if a fault or an earth is set up), and irregular driving or racing of the engine may take place, there is some possibility of an abnormal current passing along a circuit; in which cases danger exists, and it is an advantage when means exist for automatically severing the circuit. This is what fuses are intended to do.

The requirements of a good fuse are:—

(1) It must be reliable and easy to replace. Figs. 55, II. and III. show very satisfactory fuses possessing an insulating bridge for readily inserting the fuses when one has blown. Reliability is, of course, the essential quality of a good fuse. The material should be cheap, have a low melting point, not fuse explosively, nor be liable to undergo oxidation or molecular change with

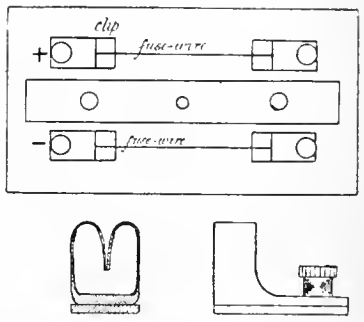

Fig. 57.

heating or lapse of time. The following particulars respecting some of the chief metals recommended will be useful.

Platinum has a high melting point (3,632° F.), is very costly, but is not affected by heating or time. Mr. Preece recommends this metal, but it is not advisable to risk such high temperatures before the wire melts.

Copper melts at 2,100° F., fuses explosively, and is liable to change its melting point after repeated heating, and it is not cheap.

Iron melts at 2,000° F., and although cheap, it very readily oxidises.

Lead has a low melting point (608° F.), is cheap, but very oxidisable.

Tin melts at 446° F., does not readily oxidise, and is cheap.

(2) It should enable perfect contact to be made between the fuse and the conductor, and the size of the parts should be such as will not permit too much conduction or radiation of heat. To insure good contact the fuse portions are often fastened

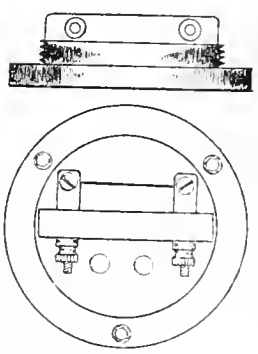

Fig. 58.

to copper contact tips or clips at each end, as shown in Fig. 55. For the smaller fuses the fuse wire is often wrapped round the terminal and secured by a nut. The contact area should be at least twice that of the sectional area.

(3) The base should be made of insulating and inflammable material.

(4) The whole should be provided with a non-combustible insulating cover if not for use on a fuse board placed in a box.

The materials of which fuses are generally made are tin, lead, or an alloy of 6 parts tin to 4 parts lead. And the point at which a fuse will break depends not only upon the material of which it is composed and upon the current passing, but also upon the length and sectional area, the temperature of the surrounding air, whether it is covered and to the degree of

exposure, and the material of the contact at the slip.

As regards the length of a fuse wire, it is important to remember that whilst the fuse should allow with ease the necessary current, there should be no possibility of arcs forming when such does occur, and it is usual in practice to allow not less than 1in. between the fuse terminals for 100 volts, and to allow 1in. additional space between the terminals for each 100 volts in excess of 100 volts. And in considering the length of the fuse wire for the correct strength, it is usual to allow 1½in. for 1 ampère and ½in. for each 5 ampères in excess of the first 5 ampères. Usually wires are used for currents up to 50 ampères. In deciding upon the dimensions it must also be remembered that the resistance per unit length should be great compared with that of the conductor, so as to concentrate the heat in the fuse, but it should not be so great as to affect the resistance of the circuit, and so produce waste. From a large number of experiments made by Mr. Preece, the following formula has been deduced for finding the diameter of the fuse wire for a given current

$$C = a d^{\frac{3}{2}} \text{ and } d = \left(\frac{C}{a}\right)$$

Where d = diameter in inches, C = current in ampères, and a = a constant for the material used. When d is in inches, the following are the values for a:—

Platinum	4,750
Copper	10,244
Iron	5,148
Lead	1,579
Tin	1,642
Alloy (lead and tin 2 to 1)	1,318

Whilst considering the proper size of a fuse, it will be well to mention that much difference of opinion exists as to whether 1 the size should be proportioned to the current they are intended to carry, or 2 the size should depend upon the size of the smallest conductor they should protect;

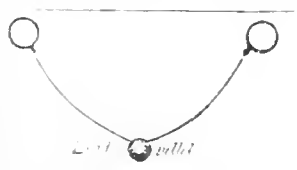

FIG. 59.

and of the two the former is probably the better basis, and is the one recommended. The percentage of increase on the advisable normal carrying current at which the fuse should break, the General Electric Company have found to be approximately:—

For fuses up to 5 ampères	.....	100	per cent.
,, ,, 10 ,,	.....	80	,,
,, ,, 20 & 30 ,,	.....	50	,,
,, ,, 50 ,,	.....	45	,,
,, ,, 100 ,,	.....	35	,,

Many insurance companies, however, fix the percentage of increase at 50 per cent. for all ordinary cases. Probably the best advice is that the actual size should be decided upon after an experimental trial has been made with the material to be used.

Fusible cut-outs are usually divided into single-pole, double-pole, main, and branch cut-outs. Fig. 56 shows a single-pole fuse and base, Fig. 57 a double pole for main circuits so that each main is protected, whilst Fig. 58 shows in plan a branch cut-out. It will be observed that in Figs. 56 and 57 a dividing ridge of porcelain is provided in connection with the base, so as to prevent short-circuiting, and to improve the insulation generally. To prevent oxidation, the fuse wire should be coated with shellac varnish: and we may mention here a very novel arrangement for insuring the fuse melting at the proper time, which was introduced by Cockburn, and is shown in Fig. 59. It is a weighted fuse, a pellet of lead being fixed as shown, which breaks the fuse wire as soon as it becomes soft, and so prevents uncertainty in the action of the fuse.

Generally speaking, fuses should be placed at the commencement of each pair of mains. On the main circuit, and as near the source of supply as possible, double-pole cut-outs should be used, care being taken that the fusible sections should not be in the same compartments. Fuses should also be placed at all branching points whenever a change in the gauge of the conductor occurs. Also, since an excessive flow of current would fuse lamp filaments, each lamp should be protected by a fuse, which may conveniently be placed in the lamp-switch. In all cases it is a matter of importance that fuses should be placed at accessible points, and should never be placed under floors or

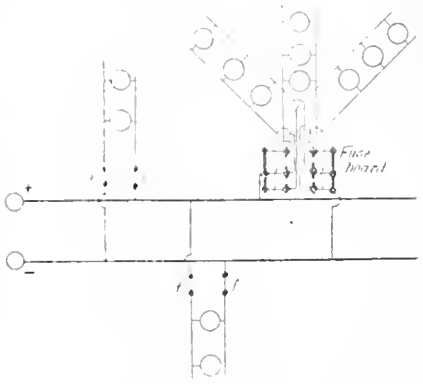

FIG. 60.

behind skirting boards, &c. In good work the practice is to use fuse-boards wherever possible, in which case a number of circuits are protected by separate fuses at the distributing point. Fig. 60 represents the disposal of fuses in practice. And whilst fuses must be used, it must be remembered that careless fixing and the injudicious use of fuses tends to a waste of energy.

Branches from all circuits should have fuse-boxes made of porcelain or other incombustible material on both poles, and the fuses in these fuse-boxes, if on the same base, should be in separate compartments. Where the tree, or tapered, system of wiring is allowed, fuses should be introduced at such intervals that each fuse protects the smallest branch between it and the next fuse; or, if there is no other fuse, then it must protect right up to the end of the circuit. If the above precautions are taken, it is not necessary to protect the ceiling roses which support flexible pendants, by fuses at the ceiling point of junction.

Whenever circuits not exceeding 5 ampères have fuses in each pole at the distributing point, fuses in the connectors are not necessary: should the current, however, exceed 5 ampères up to 125 volts, or 2 ampères up to 250 volts, all portable fittings requiring flexible cords, or adapted fittings wired with flexible cords, must be protected with a fuse at the point of junction with the circuit.

Where one of the conductors is connected to earth, all switches and fuses which will be single-pole should be arranged on the insulated side of the system. No fuses or switches should be placed in or at any point of the earthed conductor. Standard types of fuses should be so designed as to avoid the risk of inserting fuses intended for large circuits into the fuse carriers of small circuits, and *vice-versâ*. The covers of all fuse-boxes, whether these be separate or grouped on switch-boards, should be efficiently ventilated, so as to avoid risk of fracture by the sudden expansion of the air within them at the time the fuse melts, the covers being arranged to catch and retain the fused metal.

(To be continued.)

THE CLERKS OF WORKS' ASSOCIATION.

THE fifteenth annual dinner of this association was held at the King's Hall, Holborn Restaurant, on Monday evening, and was well attended. Mr. W. H. Seth-Smith, F.R.I.B.A., occupied the chair. Mr. John Brady proposed the toast of "The Architects and Surveyors," remarking that, while the architect was the best friend of the clerk of works who did his duty, or even made an approach to so doing, the surveyor understood the details of a builder's work better than anyone else who came upon the job—in fact, he claimed that the capable surveyor was a born clerk of works. Mr. G. H. Fellowes Prynne, F.R.I.B.A., in the course of an eloquent response, observed that in that association architects recognised a great guarantee for the proper supervision of their work. The clerk of works was the eye of the architect, and carried his reputation in his hand. The architect could not be expected by the client to look after every detail of the work: this task had necessarily to be delegated to the clerk of works, whose responsibilities were consequently enormous. Mr. Alan Paull, F.S.I., also responded. Mr. W. S. Woolacott, past-president, proposed the toast of "The Worshipful Company of Carpenters." Mr. Stanton W. Preston, the clerk to the company, in replying, said that during the twenty-one years he had been its clerk, the company had risen from comparative obscurity to an important position as a leading City guild. When they built their hall in London Wall, they decided to use it for promoting the welfare of the building trades as far as their means would allow. They organised exhibitions at which the quality of work submitted had steadily improved: courses of free lectures on subjects important to the building trades were instituted, and had been well attended: a series of workshops had been built on part of their estate at Stratford, where they trained 160 boys in the day and 280 in evening classes; and, lastly, they established the Technical Schools in Great Titchfield-street, W., which was now attended by 265 young men, it being made an essential that each student should be actually engaged in the trade taught. In conclusion, he referred to the valuable assistance rendered by the secretary to the association, Mr. F. Dashwood, and their successive presidents in carrying out the company's examinations. The Chairman then gave the toast of the evening, "Prosperity to the Clerks of Works' Association," coupled with the name of Mr. P. J. King, the president. Mr. King responded. The remaining toasts were "The Visitors," proposed by Mr. E. W. Nightingale, past-president, and acknowledged by Messrs. H. T. Hare and L. W. Solomon; "The Press," proposed by Mr. A. S. Flower, and responded to by Mr. W. T. Plume; "The Hon. Treasurer, Mr. J. Oldrid Scott," given by Mr. Spooner and acknowledged for Mr. Scott by Mr. Edmunds; and "The Chairman," proposed by Mr. J. G. Peacock.

THE METROPOLITAN ASYLUMS BOARD SOUTHERN HOSPITAL COMPETITION.

WE give now the names and addresses of the architects invited to compete for this building. This information, as we stated a few weeks since, was refused to us by the clerk to the Board on the somewhat curious ground that it was unfair to competitors that they should know against whom they were competing! As we then stated, *somebody* knew the names of the competitors, and was already writing to them offering to assist them in the preparation of their designs:—

H. P. Adams, 28, Woburn-place, W.; Arthur Ardron, 8, Delahay-street, Westminster; C. O. Ellison and Son, 22, Sir Thomas-street, Liverpool; Giles, Gough, and Trollope, 28, Craven-street, W.C.; Greenaway and Smith, 21, Queen Anne's Gate, S.W.; E. T. Hall, 57, Moorgate-street, E.C.; John Harvey, 47, Victoria-street, S.W.; B. S. Jacobs, Lincoln's Inn Buildings, W.C.; M. Macartney, 52A, Berkeley-square, W.; Newman and Newman, 31, Tooley-street; Pennington and Son, Hastings House, Norfolk-street, W.C.; Smith and Croggin, 14, York-buildings, Adelphi, W.C.; E. Thomas and Son, 7, Queen Anne's-gate, S.W.; Treadwell and Martin, 2, Waterloo-place, S.W.; Woodd and Ainslie, Broad Sanctuary Chambers, Westminster.

The competition has some objectionable features about it which will probably lead to unpleasantness. We think, for instance, the following clause in the "Terms of appointment" sent out by the Board is a very unfair one:—

> Any dispute or question between the architect and the Managers shall be referred to an arbitrator *appointed by the Managers*, who shall have such powers and authority *as the Managers may think fit to give him*, &c., &c.

A condition of this kind, once accepted, leaves the architect entirely at the mercy of the managers. We believe it has not been accepted by all the competitors without protest; but we should like to have been able to say that all had sufficiently valued their professional independence to join therein.

The work of re-hanging the bells and providing chimes for the clock has now been completed as part of the Canterbury Cathedral restoration scheme. The inauguration of the bells and chimes took place on Saturday.

The technical institute at Grantham was opened by Earl Brownlow last week. The premises were till recently a disused cigar factory, near the Guild-hall, and the alterations and refitting have cost about £1,000. The whole of the structural alterations have been executed by Messrs. Walker Bros. and Parks, of Grantham, from plans drawn by the borough surveyor, Mr. F. Morris.

Building Intelligence.

EXMOUTH.—The new church of All Saints, Exeter-road, Exmouth, was dedicated on Wednesday week. It is in the Pointed style of architecture and is built of Berry Head limestone, with windows and doorways in Bath stone. The piers of the arcades are of Polyphant polished stone. The flooring of the chancel is of marble and marble mosaic, with solid wood block flooring elsewhere. In plan the church consists of nave, north and south aisles, north and south transepts, chancel, morning chapel (occupying the site of the future tower), baptistery, organ chamber, and vestries for the clergy and choir. There is sitting accommodation for about 700 persons. The cost of the building will be about £8,000, exclusive of the tower. The seats are of unvarnished pine. Among the special gifts are the alabaster reredos, the font, and organ. The architects are Messrs. Gate and Harvey, of Exeter; while the builders are Messrs. Luscombe and Son, with Mr. J. Pullen as clerk of works.

LIVERPOOL.—The corner stone of the new building for the Royal Insurance Company in North John-street was laid on Friday by the chairman of the directors. The architect is Mr. T. Francie Doyle, of Liverpool, whose plan was out first in competition by the assessor, Mr. Norman Shaw, R.A. The style is Classic, adapted to modern requirements. The substructure will be of grey Aberdeen granite to a height of 30ft. above the pavement level. The superstructure will be composed of white Portland stone, and roofed with green slates. To the Dale-street front will be a gable rising 110ft. above the pavement. In North John-street will be placed the main entrance, which will be surmounted by a tower 150ft. high. At the south end will be the entrance for tenants, which also has a tower, but of less importance. A feature in the building is the steel construction, introduced to obviate the necessity of columns on the ground floor, which for the entire length will be utilised as the general offices of the company.

MOSELEY.—The parish church was reopened yesterday (Thursday), after undergoing considerable enlargement, upon a plan adapted to further developments at some future time. The alterations have been designed by Mr. J. A. Chatwin, whose plan provides a large chancel, a chancel aisle, and also a south transept, which will provide 100 additional sittings. It is proposed hereafter to divide the present body of the church into a well-proportioned nave and south aisle, and to form large clerestory windows. The east window consists of seven lights, so constructed as to bring in the three stained-glass windows of the former chancel. The chancel and transepts externally are faced with Bromsgrove stone. The floors are laid with wood blocks, while the portion of the chancel within the altar-rails is paved with glass mosaic. The roofs are covered with slate. Messrs. Collins and Godfrey, of Tewkesbury, were the contractors. The outlay has been between £2,000 and £3,000.

STOCKPORT.—The board of guardians of the Stockport Union considered, on Monday, eight tenders for the erection of the proposed new workhouse at Stepping Hill, near Hazel Grove. The highest tender was £160,467, and the lowest £138,476. A committee had previously opened the tenders and recommended, by eight votes to four, that the work should be divided into two contracts, and that the tender of Messrs. T. and W. Meadows, of Stockport, for No. 1 section of the buildings at £68,614, and for the roads at £4,362, and the tender of Messrs. Storrs, Sons, and Co., Limited, of Stalybridge, for No. 2 section of the buildings at £63,163 be accepted. The chairman said there was a private letter on the subject to the clerk. The representatives of the Press were requested to leave the Board-room whilst the letter in question was read to the guardians. Upon their readmission the vice-chairman said that the architect (Mr. W. H. Ward, of Birmingham) had told them they might let the two sections separately, and now there was a letter to a different effect. It was very mysterious indeed. It was ultimately proposed to adopt the recommendation of the committee, and an amendment was moved to give all three contracts to Messrs. Meadows. The amendment was defeated by 23 votes to 11. A further amendment, to adjourn the question to a special meeting of the board and to request the architect to be present, so that he might be given an opportunity of explaining why he now asked the majority of the building committee to "eat their own words," was passed by a large majority.

CHIPS.

Mr. George Cartledge, headmaster of the Rochdale School of Art, has been appointed headmaster of the important art school at Hanley, his native town. Mr. Cartledge has been in Rochdale only about 18 months. He succeeded Mr. R. B. Dawson on that gentleman's removal to Kidderminster.

The City Art Gallery at Manchester was reopened to the public on Monday. The permanent collection has been transferred to the eastern side of the building and rearranged.

Mr. Ogden has been elected headmaster of the school of art at Canterbury, in succession to the late Mr. H. Allen.

At the quarterly meeting of the Inverness District Asylum Board on Friday tenders for the construction of additions to the Inverness Asylum were accepted at £13,141. A total of £25,000 has been expended during the past two years on the extension of the building, the demands upon which have greatly increased.

There was a very large gathering in the Central Hall of the new Mount Pleasant Schools, Southampton, on Thursday in last week, when Sir George Kekewich, G.C.B., performed the opening ceremony. The architect was Mr. J. H. Blizard, architect to the Southampton School Board, and his designs have been carried out by Messrs. H. Stevens and Co., contractors, of Southampton.

On Friday last, at the Grosvenor Hall, Buckingham Palace-road, between 300 and 350 employés of Messrs. Drake and Gorham and their friends attended a smoking concert organised for the staff, and a very pleasant evening was spent. Mr. Drake stated that 1897 had been the firm's record year in turnover, in spite of increasing competition, and that during the past 12 months £1,000 had been distributed among the employés in the form of bonuses.

Mr. James F. Smith, one of the best known civil engineers in Pennsylvania, died at Reading, Pa., January 31. He was born in Pittsburg and started in his profession in 1831, when he was appointed assistant civil engineer of the Allegheny Portage Railroad. He was chief engineer of the Schuylkill Navigation Company from 1859 to 1876, and during the later years of his business life was consulting engineer of the Philadelphia and Reading Railroad Company. He retired from active life about 10 years ago.

Last week was a quiet one at the Auction Mart, Tokenhouse-yard, and it is noteworthy that there is less demand than recently for freehold ground rents. The aggregate realisation for the week was £17,740, as against £70,770 registered for the corresponding week of 1897, but this week an unusually large number of investments have been placed on the market, and have on the whole realised fair prices.

At the last quarterly meeting of the Corporation of Ipswich, another handsome gift to the town was accepted—that of premises in St. George's-street at the rear of the museum, a property which was purchased by the late Alderman Sterling Westhorpe, with the intention of adding it to the museum, and is now presented by his executors. This will enable the museum buildings to be carried through from High-street to St. George's-street.

The Roman Catholic Church of St. Joseph, Huddersfield, erected in 1891, was reopened on Sunday after having undergone a course of total redecoration and ornamentation after Florentine designs. The alterations and additions have been worked by Messrs. Crasso, of Belgium. The decorations include ornamentation of the sanctuary, with the figure of the "Sacred Heart," and fourteen pictures on the walls of the Stations of the Cross.

Glasgow Dean of Guild Court have passed the plans for three tenements of shops and dwelling-houses and a public wash-house which are to be erected in the Calton district by the Improvement and Police Departments of the Corporation. The tenement, which will be four stories in height, will comprise room-and-kitchen and single apartment houses, rented at from £7 15s. to £11. The cost is estimated at £7,270. The wash-house, which will be erected to the rear of the tenement, will be 76ft. long by 75ft. broad, and will contain 14 stalls. The architect is Mr. A. B. M'Donald.

Peterborough Town Council having applied to the Local Government Board for sanction to borrow £15,000 for purposes of electric lighting, Mr. W. O. E. Meade King, M.Inst.C.E., has held an inquiry at the instance of the Local Government Board, at the Guildhall, Peterborough. In answer to the Commissioner, the Town Clerk stated that the population of Peterborough was now 31,000.

PROFESSIONAL AND TRADE SOCIETIES.

ARCHITECTURAL ASSOCIATION OF IRELAND.—On Tuesday evening a meeting of the Architectural Association of Ireland was held at the Grosvenor Hotel. Mr. Cecil Orr, A.R.I.B.A., delivered a lecture on "The History of Architecture." The lecturer first showed the origin of design from natural objects, and the rise of Greek architecture from Egyptian and Assyrian work. He pointed out that Roman architecture was a development of Greek work united to the architecture which they had got from the Etruscans. He next showed how Constantine the Great had transplanted the Roman arts to Constantinople, his new capital, where they became united with the eastern work of the Sassanians and Phœnicians. Here Mr. Orr broke off his treatment of European work, with the remark that the native work of Ireland was derived not from the Byzantine school, but from the common origin with the Phœnicians through Carthage. He then dealt at some length with Moorish architecture. In his second lecture Mr. Orr will deal with the development of Gothic architecture.

EDINBURGH ARCHITECTURAL ASSOCIATION.—At a meeting of this association, held on February 9, the president Mr. Thomas Ross in the chair, Mr. James A. Williamson, past president of the Architectural Society, read a paper on "The Vernacular of the Wren School," illustrated by limelight views. The lecturer gave an historical resumé of the Renaissance in Great Britain from the earliest period of its influence, in the reign of Henry VIII., till the beginning of the 17th century, when the architectural authority of Inigo Jones became paramount. Mr. Williamson stated that Inigo Jones was the first Englishman to grasp in its full significance the art of the Italian Renaissance. The works of Inigo Jones were minutely described, particularly the palace at Whitehall for James I. This work, the lecturer considered showed that Jones possessed a complete master of proportion, a keen sense of the balance of voids and solids, and full knowledge of the value of chiaroscuro. He was one of the most brilliant architectural designers this country had ever produced. Sir Christopher Wren, as the acknowledged head of the school, was next dealt with in an exhaustive manner, and his several outstanding achievements in design described in detail, notably St. Paul's, Hampton Court Palace, St. Mary-le-Bow, and Walbrook. Mr. Williamson claimed that Wren founded a strictly vernacular school of architecture based on the principles of Italian Renaissance, and that, never having visited Italy, he approached the study of his great works with a mind free from the trammels of precedent, in which, perhaps, the instinct of the engineer rather than the artist predominated. After a further detailed reference to the successors of Wren, including architects such as Nicolas Hawksmoor and Vanbrugh, the lecturer concluded by referring to the eclectic and cosmopolitan character of the architecture of the present day, arguing in favour of a return to the best examples of the Wren school, with a view to a logical development of the spirit then in force towards perfection on traditional and vernacular lines.

NORTH OF ENGLAND FEDERATION OF MASTER PAINTERS.—The annual meeting of this federation was held at the Star and Garter, Middlesbrough, on Monday, under the presidency of Mr. Wm. Allan. The secretary, in his annual report, stated that at the end of 1897 there were 135 members, and he believed that now there were 155. The treasurer presented a report, which showed a balance in hand of £5 7s. The report and balance-sheet were adopted. The president expressed the pride and pleasure he had felt in occupying the position during the first 18 months of the federation's existence. They had federated with them every local association in the North of England, except one at Bishop Auckland, which they expected would soon join them. They hoped also to see a local association formed at Darlington. He moved that the president for the ensuing year be Mr. John Scott, of Middlesbrough. This was carried unanimously. Mr. J. G. Cole Newcastle was elected vice-president, Mr. Wm. Allen South Shields was elected treasurer, and Mr. R. G. Salmon was elected secretary.

PORTSMOUTH MASTER BUILDERS' ASSOCIATION.—The annual meeting of this association was held on Tuesday last at the Sussex Hotel, Land-

port. Mr. C. Dye, T.C., the chairman, retired in the usual course, and Mr. J. H. Corke, J.P., was elected for the ensuing year. Mr. A. E. Porter was appointed vice-chairman, Mr. C. Harding treasurer, and Mr. F. Simpson secretary; Messrs. C. Dye, H. Jones, J. Cockerell, W. Light, C. Reading, W. W. Evans, and J. W. Perkins were elected on the committee. Among the matters discussed and referred to the new committee was the demand for increased wages by the men, the notices in connection with which expire on May 1.

CHIPS.

A new clock, built by Messrs. John Smith and Co., of Derby, has just been placed in the parish church of Cheriton Fitzpaine, Devon.

Dr. Collins, Chairman of the London County Council, on Saturday opened an extensive block of buildings which has been added to the Woolwich Polytechnic. The new buildings, which, with the equipment, have cost about £9,000, are intended to accommodate students in chemistry, physics, and art.

The Admiralty have just accepted a tender for the enlargement of the Royal Naval Barracks at Keyham to provide the accommodation that will be required when the extensive dock works in progress are completed. The addition to barracks will be for a thousand men, and with a new set of officers' quarters. The work will be taken in hand forthwith, and is to be finished in three years. The capacity of the barracks will be doubled. Mr. A. R. Debnam, of Mount Pleasant, Plymouth, has taken the contract, and the work will be carried out under the supervision of Major H. Pilkington, C.B., R.E., the engineer-in-chief of the Navy Loan Works.

In a report posted at Tuesday's meeting of the London County Council, particulars were given by the Bridges Committee with respect to the design for the new Vauxhall Bridge. Sir A. R. Binnie has prepared a design for a granite bridge backed with concrete, a priuciple adopted by his predecessor, Sir J. W. Bazalgette, in New Putney Bridge. This will save about £1,000 a year in the painting required by an iron bridge of equal dimensions. The estimate is £380,000, with a possible reduction of £20,000.

In an application for an ejectment order against a tenant of a house in Outer Moss-lane, Morecambe, made to the Lancaster County Bench on Saturday, it was stated that although the house had been recently built, the walls were cracked from top to bottom, and the district council had declared it to be dangerous.

The Local Government Board report on the Ruskington waterworks question, based upon the evidence taken at the recent inquiry held before Colonel Langton Cobb, C.E., decides that the Ruskington Urban District Council are in default, and allows three months only in which the council must construct a reasonable scheme of waterworks for the parish.

After a prolonged discussion the urban district council of Weston-super-Mare finally adopted at the last meeting the plans of Messrs. Stewart and Grace, selected and premiated in the recent competition, for the proposed pavilion and accessories at Knightstone, but the plans are to be amended and reduced. Mr. Stewart expressed his willingness that the conditions and terms of remuneration specified in the original conditions of competition should apply to his amended plans, and that the commission should be reduced to 2½ per cent. for the preparation of plans, specifications, estimates, and attending public inquiry, &c., exclusive of all out-of-pocket expenses, in the event of the project not being carried out.

At Tamworth a new board school for boys, built in the Leys at a cost of £7,000, was opened on Thursday in last week. The school is on the central hall plan and accommodates 500 scholars. During the proceedings a vote of thanks was passed to the architects, Messrs. W. and J. Goodacre, Leicester; and to the contractors, Messrs. C. Clarson and Son, Tamworth.

The new line in Leith of the North British Railway Company will be proceeded with very shortly. The line leaves the company's system at London-road junction signal cabin, below Abbeyhill Station, and proceeds in a northerly direction to the foot of Leith Walk. At the junction of Leith Walk with Duke-street a large passenger station will be erected. Messrs. Young and Sons, of Edinburgh, have taken the contract at between £90,000 and £100,000.

The *Tablet* says that the reports which have been circulated concerning the legacy left to the Bishop of Liverpool by the late Mr. James O'Byrne, architect, of Liverpool, have greatly exaggerated its amount. The residue of the estate left to the R.C. Bishop of Liverpool amounts to between £10,000 and £15,000.

COMPETITIONS.

Belper.—At the last meeting of the rural district council, it was stated that from competitive schemes for the water supply of Crich and South Wingfield which they have received, that of Mr. W. H. Taylor, of Birmingham, had been selected. He proposed to give water for Crich at an estimated cost of £2,790.

Bootle.—At the last meeting of the town council, a committee brought up a report recommending the adoption of the award by Mr. Turton, of Liverpool, the assessor in the competition for the fire-brigade station. He recommended that the plan numbered 14 be placed first and be adopted for execution, subject to the conditions of competition and instructions to architects, and to any modifications in points of detail which the joint committee may consider desirable. Design No. 1 was placed second in order of merit. The report was adopted, an endeavour to refer the matter back to the committee being defeated, and on opening the sealed envelope it was found that the successful competitor was Mr. C. J. Anderson, of Dale-street, Liverpool. The limit of cost is £15,000.

Taunton.—Designs for a town-hall are invited by the market trustees, premiums of £100, £50, and £30 being offered for the three best designs. Mr. Edward W. Mountford, F.R.I.B.A., of London, has been appointed professional assessor.

Wolverhampton.—The referee, Mr. Alfred Waterhouse, R.A., has this week made his examination of the designs submitted in the select competition for the Public Library to be built as a Jubilee memorial on a fine site facing Snow Hill, Wolverhampton. The plans were sent in last Monday, and on Wednesday the committee confirmed the award which accords the first premium to Mr. H. T. Hare, and the second to Mr. J. M. Brydon. The drawings are to be on view during the next seven days to the public. The total cost, including premiums, architect's fees, measuring-up the building when finished, and all fittings, electric lighting and warming, is limited to £10,000. Nine sets of designs were received.

The school board for Littlehampton have appointed Mr. Leonard Stokes, of Spring-gardens, as assessor in a competition for a boys' school, the fee to be paid being thirty guineas.

The Scottish National Gallery, which for a month past has been undergoing a thorough overhauling, has been reopened to the public this week. Two new and important pictures have been added to the collection—a Raeburn and a Hogarth. The Raeburn is a legacy from Lady Riddell, of Kilcamb, Strontian, and is a portrait of Mrs. Campbell, of Balliemore; the Hogarth is a legacy from Lady Jane Dundas, and is a cabinet portrait of Sirah Malcolm, a criminal, who was executed in 1733; she is portrayed as seated in her prison cell, with a cross and string of beads lying on a table in front of her.

On Saturday, February 5th, the foundation-stone of a new church, to be known as St. Peter's, at Beeston, a suburb of Nottingham, was blessed by the Right Rev. Mgr. McKenna, V.G. The church, which is being erected by Mr. Turner, a local builder, from the plans of Mr. Hurt, of Derby, will seat about 150, and cost with the site (80 sq.yds.) a little over £600.

Mr. George Armstrong Howitt, sculptor, passed away at his residence, 13, Prince-street, Gloucester, on Tuesday week, at the age of 86 years. Mr. Howitt was a native of Gloucester, and was apprenticed to a sculptor. One of the earliest works he was engaged on was the statue of the Rev. Richard Raikes in the cathedral. Subsequently he was engaged by Sir Digby Wyatt, whom he assisted in church and mission work in various parts of the country; and he also acted in a professional capacity to the Marquis of Ailesbury, the Marquis of Lansdowne, and Lord Falmouth. He retired some 17 years ago. He was awarded the Royal Polytechnic Society's set of medals for portrait heads carved in oak, walnut, and boxwood.

The members of the Glasgow Building Trades' Exchange held their first annual dinner on Thursday night in last week, in the Windsor Hotel, St. Vincent-street. Colonel Robert J. Bennett, president, occupied the chair, and the croupiers were Mr. Alexander Gray, Mr. Alexander Muir, and Mr. John Paterson. There were about 120 gentlemen present. Mr. Peter Lawrence proposed the toast of the evening, "Glasgow Building Trades' Exchange," which was acknowledged by the chairman. Mr. John Laird gave "The Merchants' and Trades' Houses of Glasgow," and the Lord Dean of Guild and the Deacon-Convener replied.

PARLIAMENTARY NOTES.

The South Kensington Collection.—Sir F. Powell asked the First Commissioner of Works on Monday what steps the Government had taken to carry out the recommendations of the select committee of last session on the museums of the Science and Art Department for the protection of the collection at South Kensington from the imminent risk of fire: and whether they were prepared without further delay to proceed with the completion of the permanent buildings in accordance with the recommendations of the second report of the same committee. Mr. John Burns also asked a question on the same subject.—Mr. Akers-Douglas: The old buildings known as the "Boilers," the temporary building in the inner quadrangle, and the students' refreshment-rooms have been removed. Various other works are in hand, including the fireproofing of the room next the Raphael Gallery, and the improvement of the southern galleries on the west of Exhibition-road. The private residences of the officials are to be abolished. These, in the opinion of the Government, comprise all the matters of urgent necessity, in view of the fact that a proposal for proceeding at once with the permanent buildings will shortly be laid before Parliament.—Mr. Burns asked whether they were to assume that "at once" meant the current year?—Mr. Akers-Douglas: I have every reason to hope so.

The corperation of Colchester have adopted amended designs for the rebuilding of the Town-hall, submitted by Mr. John Belcher, F.R.I.B.A., of London, whose design was placed first in the recent competition, and have appointed Mr. Belcher architect on the terms previously arranged for.

A Local Government Board inquiry has been held at Bishopstoke, by Colonel Durnford, R.E., with reference to an application by the Winchester Rural District Council for permission to borrow £5,000 for the purpose of carrying through a sewerage scheme for the parish of Bishopstoke.

At the weekly meeting of the London County Council on Tuesday, the Building Act Committee recommended that Mr. Andrew Moseley, who has been district surveyor for Fulham for nearly 54 years, should be called upon to resign his position.

At the last meeting of the Glossop Town Council the plans were estimated of a technical school which Lord Howard of Glossop proposed to build on a site opposite the free library, the architects being Messrs. Douglas and Minshull, of Chester. The schools will be three stories high, and large rooms have been allocated for classrooms, laboratories, &c. The plans were approved, and a resolution thanking Lord Howard for his generous gift was passed.

The designs submitted by Mr. T. G. Jackson, R.A., and Mr. T. Brock, R.A., for the Benson monument in Canterbury Cathedral having been accepted by the committee of the memorial fund, the execution of the altar tomb has been commenced. The recumbent effigy of the late Primate will represent him in an attitude of prayer.

The east window of Ripon Cathedral is being rearranged as a memorial to Dean Fremantle, and two brasses have been placed underneath. Mr. A. O. Hemming, of Margaret-street, W., is executing the work under Sir Arthur W. Blomfield, A.R.A.

At the Manchester Assizes on the 10th inst., an action was brought by Dr. G. C. Kingsbury, of Blackpool, against Mr. George H. Willoughby, a Manchester architect, to recover damages for slander. Some interesting revelations in regard to hypnotic medical treatment were disclosed during the hearing of the case. The jury gave a verdict against the defendant, damages 20s. and costs.

The new temporary hospitals for the Guardians of the Rochdale Union are being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves, with ornamental tiled sides, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Mr. R. Norman Shaw, R.A., has accepted the position of architect to the Westminster Improvement Scheme, and Mr. Elward L. Lutyens will be associated with him in advising the promoters of that extensive project for rebuilding the dilapidated properties and embanking the river between the Victoria Tower and Lambeth Bridge.

The design submitted by Mr. T. F. Pennington, of Castleford, has been accepted in a limited competition for a Wesleyan chapel and Sunday-school to be built at South Kirkby, near Pontefract. The chapel is to accommodate 350 persons, and the schools 200 children; the style adopted is Free Gothic, the materials will be brick and stone, and the cost will not exceed £1,500.

The Ayr Town Council decided on Monday, after two hours' discussion, to proceed with the erection of the new town hall on the old site, at a cost of £15,500, which includes £3,200 for additional property to increase the size of the hall and provide additional exits.

NEW PREMISES, GOSFIELD STREET, W.—SECOND PREMIATED DESIGN FOR CHESTERFIELD SCHOOLS AND BATHS.—PROPOSED CHURCH AT CRESSWELL.—SILVER MEDAL STUDIES OF ANIMAL LIFE TREATED FOR DESIGN.—HOUSE AT SURBITON.—SKETCHES FROM DIEPPE.—TWO SOMERSETSHIRE PULPITS.

Our Illustrations.

NEW PREMISES, IX. AND X., GOSFIELD STREET, W.

THE above building contains the sets of small flats of two and three rooms each, with a separate w.c. to each set of rooms. On the top of the 4th floor is a washhouse for the use of all the tenants generally. The roof is flat and covered with asphalte, this being laid on Messrs. Stuart and Co.'s granolithic roof. The front is in picked yellow stocks, the quoins, heads, &c., in red bricks, and the stonework is Portland. The lower portion of the jambs to entrance-door are in glazed brown bricks. The contract was let for £1,863 6s. 2d. to Mr. James Carmichael, who carried the work out. The stairs from top floor to basement are in granolithic. The architect is Mr. W. Hargreaves Raffles, of 9, Argyll-street, Regent-street, W.

SECOND PREMIATED DESIGN FOR THE CHESTERFIELD SCHOOLS AND BATHS.

THE elementary school proper is placed at the rear of the block at the same level as Brewery-street, and reached by separate entrances for males and females, which pass over the swimming-bath. The bath has been placed well to the front to afford facility for the use of the public. Care has been taken in the planning of the buildings to insure the carrying out of the future extensions, so that the whole may be a complete and compact scheme. The accommodation for the instruction in cooking and laundry work has been planned in the basement, and is reached from the main school floor by two fireproof staircases, which are also used for the swimming and slipper-baths by the children. Separate entrances to swimming and slipper-baths are also provided, so that the public in using the baths do not interfere with the ordinary working of the school. The buildings were to be constructed in brick; the exterior to Brewery-street of red pressed brick and stone; best green slates are to be used on roofs. The internal walls of rooms to be lined with glazed brick from floor to ceiling; staircases and passages to have a dado of brown glazed brick, the upper part to be in white glazed brick. The swimming-bath is to be lined with white glazed brick. This scheme was submitted by Messrs. Hall, Cooper, and Davis, architects, Scarborough, and was placed second by the assessor, Mr. E. R. Robson, Messrs. Houston and Houston, London, taking the first premium. We understand the board has now accepted an amended plan by a local architect, which they intend to carry out.

PROPOSED CHURCH, CRESSWELL.

MESSRS. BREWILL AND BAILY are the architects, whose drawing of this building we are illustrating to-day. No particulars of the work have come to hand, and the plan accompanying the view shows the contrivance of this picturesque church.

STUDIES OF ANIMAL LIFE TREATED FOR DESIGN: THE ARCTIC TERN.

THESE silver-medal drawings, by Mrs. M. E Dawson, are devoted to decorative studies of the Arctic Tern, whose graceful flight is extremely beautiful, and the elegant proportions of the bird lend themselves exceedingly well for treatment in ornamental or mural design. The Japanese have utilised bird-life, of course, in all its divergences, though seldom with more success than in the employment of aquatic fowls. Mrs. Dawson, in a way, appears to reflect the type of design to which this passing note refers, and, while not hesitating to conventionalise her pencil, may be said to be always true to nature.

HOUSE AT SURBITON.

SOME capital examples of picturesque house-building have of late years been carried out in the district round about Surbiton. The design herewith illustrated was sent us some time ago by Mr. Walter E. Hewitt, when we gave another view of the same residence. The walls, in red brick below, have tile hanging above. The windows are mullioned in wood; but the porch is in stone, while the roofs are all covered with tiles.

SKETCHES FROM DIEPPE.

THE Castle of Dieppe occupies a commanding position at the western end of the town, the towers illustrated being in the front, at the extremity facing the sea. The bulk of the building is built of greystone, with bands and patches of red brickwork, these last being of somewhat recent date. The building was erected in 1435, but was greatly damaged—almost destroyed—at the bombardment of Dieppe by the English in 1694. The gateway shown in one of the sketches is a side entrance. The castle was, some few years ago, converted into a barrack, when the large windows became a necessity. The old half-timbered house attracts the attention of all who arrive at Dieppe by boat. It stands on the quay on the Le Pollet side of the harbour entrance. The house is, unfortunately, in a somewhat ruinous state, and its appearance is not enhanced by one side being covered with a large advertisement of the local golf club. The two crosses, one at the cathedral, and the other at the church of St. Remi, are in the squares adjoining these buildings. They are of granite, and not very elaborate. That at the cathedral is the richer one, probably because it adjoins the more important building.

J. H. CORAM.

TWO SOMERSETSHIRE PULPITS.

THESE two richly-carved and ornamented pulpits are taken from the two neighbouring churches of South and East Brent respectively, each being of oak in good preservation, and octagonal on plan. The pulpit at East Brent is entered by a staircase through the thickness of the nave wall, to which is attached the panel, having incised upon it the initials "I C, E B" and the date 1634, which is probably about the date of the other as well. The interior of East Brent has a very fine appearance, having other work beside the pulpit of an interesting nature—namely, in its carved bench ends, organ gallery, wall frescoes, and very fine ceiling. The church of South Brent is not otherwise of much interest. The sloping floor of the nave is peculiar, the western end being considerably lower than the eastern.

E. RODWAY.

At St. John's Church, Newcastle, County Down, the memorials to the Seymour family and other improvements were dedicated on Wednesday week by the Bishop of Down, Connor, and Dromore. The church, which was built by the late Earl of Annesley in 1832, has been beautified internally. The walls have been coloured, and pomegranate foliage and flowers, conventionally treated, are used as a dado. A moulded plinth course of Italian marble forms the step to the communion-table, and at a lower level double steps and risers have been placed. All the marble work was supplied by Messrs. S. and T. Hastings, monumental sculptors, Downpatrick and Newtownards. The memorials consist of a brass telescopic communion rail, with six standards, supplied by Messrs. M'Gloughlin and Co., Dublin: panelled wall tiling of chancel, in design of raised vine leaves and bunches of grapes, supplied by Messrs. Craven, Dunnill, and Co., Shropshire; and a brass tablet on the riser of step leading to the communion rail. Messrs. T. and F. Neill, contractors, Newcastle, had charge of the general improvements.

STAINED GLASS.

DOWNPATRICK.—The Down Cathedral Board have decided to reconstruct the east window in their cathedral. The window is in a dangerous condition, much of the stonework, which was erected in 1781, being defective, and likely to come down should there be a gale from the east. Its restoration has been intrusted to Messrs. Hastings and Crickard, of Downpatrick and Newtownards. Much of the stonework will have to be entirely replaced, and the remainder rechiselled. It has been decided to fill the window with stained glass. The design of Messrs. Ballantyne and Gardiner, of Edinburgh, submitted by Messrs. Hastings, was accepted by the board. In the rose light at the top of the proposed window will be a figure of our Saviour; in the quatrefoils below figures of SS. Peter and Paul seated. The figures in the other ten lights are SS. Matthew, holding the volume of his Gospel, John, Simon, Andrew, James, Philip, Thomas, Bartholomew, James the Less, and Matthias.

CHIPS.

The first anniversary of the reopening services at St. Saviour's Church, Southwark, after the rebuilding of the nave from Sir Arthur W. Blomfield's designs, was celebrated on Wednesday. A chancel screen, designed by Sir A. Blomfield—the gift of Mr. Robert Barclay—and a new clock for the tower, presented by Sir Frederick Wigan, will shortly be placed in the church.

The Markets Committee of the Wolverhampton Corporation have issued a report with reference to the condition of the Cattle Market. Its state has been condemned by every inspector of the Board of Agriculture. They recommend a number of improvements, the erection of slaughter-houses, and a house for the superintendent, at an estimated cost of £6,158.

The new Queen's Theatre at the corner of Clarence-street and Groundwell-road, Swindon, was opened last week. The building has frontages of 119ft. by 90ft., with free access on three sides, the site abutting on the main thoroughfare between Old and New Swindon. The style is Free Renaissance, and accommodation is provided for 1,600 persons. Messrs. Milverton-Drake and Pizey, of Baldwin-street, Bristol, were the architects, and Mr. C. Williams, of Swindon, was the contractor.

The death is announced of Mr. James Brashier, who carried on the business of a builder for about 50 years at 286, Brixton-road, S.W., in which he was assisted by two sons, both of whom predeceased him. Mr. Brashier retired from active business some twelve years ago, and has since resided at 17, Burton-road, where he died on Tuesday at the age of 81 years.

A general assembly of the Royal Scottish Academy was held on Friday for the election of an Academician in room of the late Mr. Otto Leyde. There were several nominations, but the only names that received strong support were those of Messrs. F. Ogilvy Reid and Alexander Roche. On a final vote Mr. Reid, who has been an associate since 1888, and has lately abandoned Scottish domestic incidents for landscape work, was elected by twenty-one to seventeen votes.

The London School Board have decided to fill one of the lunettes in their board room on the Embankment with the armorial bearings of the Marquis of Londonderry to commemorate his chairmanship. The work will be executed by Messrs. Powell, of Whitefriars.

Mr. Edward Duncan Stoney, only son of the late Mr. F. G. M. Stoney, of the firm of Ransomes and Rapier, Limited, Waterside Works, Ipswich, died in this town at the age of 29, on Tuesday week, leaving a widow and three children. Mr. Stoney superintended for the firm the erection of the sluices on the Manchester Ship Canal and those on the Thames at Richmond. He won the prize of 100 guineas for a design for the improvement of the River Severn at Bridgwater, and, had he lived, would have superintended the erection of sluices on the Clyde, for which Messrs. Ransomes and Rapier have the contract. For a year past Mr. Stoney had been in failing health.

The monthly memorandum of the Labour Department states that employment at the end of January was not so good as it was a year ago. The percentage of unemployed in the trade unions making returns was 4·96 per cent. (excluding persons directly on strike or locked out), compared with 5·34 per cent. at the end of December, and with 3·3 per cent. at the end of January, 1897. Employment in the building trades has improved, and continues good. The percentage of unemployed union members was 2·0 at the end of January, compared with 2·4 at the end of January last year. The furnishing trades are scarcely so active, though up to the average for the season. The percentage of unemployed union members at the end of January was 5·1, the same as in January, 1897.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., L., LII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Correspondence.

THE ROYAL GOLD MEDAL AT THE INSTITUTE.

To the Editor of the BUILDING NEWS.

SIR,—Mr. Wm. Woodward generally inspires useful work by his criticism of the Institute, and, though personally I cannot approve of his methods, it is evident that Mr. Woodward not infrequently imparts some life to the otherwise uninteresting proceedings which present so little attraction to the profession at Conduit-street. The dignified protest made by Mr. Woodward at the last meeting of the Institute against the nomination of Mr. George Aitchison as the recipient of the Royal Gold Medal, it must be confessed, fell very flat, and the reason for its failure was due to the fact that the technical objection thus brought forward really avoided the real merits of the case.

My contention is that it does not matter two straws whether the Gold Medallist happens to be the President of the Institute or not, provided he be the best candidate which the profession affords; but I think it is undesirable that the President should be chosen for the honour, provided there is an architect worthy of recognition by this signal distinction of the Gold Medal, and speaking generally, it would be wiser and more disinterested to select such a one from outside the Council of the Institute. As it is, the Council at Conduit-street has become somewhat a snuggery, and the plums available are retained for home consumption—witness the appointment as referees originating at Conduit-street for competitions.

But, to return to the Gold Medal. To an obscure individual like myself, it does seem unfortunate that such masters of the art of architecture as Mr. G. F. Bodley, A.R.A., Mr. John F. Bentley, Mr. Hubert J. Austin, Mr. Basil Champneys, Mr. John Douglas, Dr. Rowand Anderson, or Mr. T. G. Jackson, R.A., should be passed over and ignored. Their executed works afford the justification for the mention of their names. What can Professor Aitchison show among his buildings and designs to compare for one moment to the productions of either of these architects? Personally, I have always found the professor a most cultivated and accomplished man, and my acquaintance with his work extends back to the days when his office was in Muscovy-court, and his practice was associated with warehouses. Mr. Aston Webb's grain silo at Greenwich, as a sample of warehouse design, is worth all that Mr. Aitchison has done in that way put together, and yet Mr. Aston Webb has not received the Gold Medal.

I do not deny the learning displayed by the President in his Academy lectures, and, against all comers, I yield to none in my recognition of his good-heartedness and genial *bonhomie*, but I fail to see the surpassing beauty or architectural merit in his work at all adequate to the occasion. In questions of taste in design few probably will agree; but the Professor, for one thing, has made a point of advocating the architectural use of iron. How has he himself shown the way to its application? Turn to the much-belauded house of the late Lord Leighton. One of the last additions made by Mr. Aitchison to that building was an extension of the studio on the first floor. This is carried by iron columns, which support the brick walls above. The columns themselves are needlessly big for the work they have to do; their scantlings, in fact, are in excess of structural requirements, so that the real difficulty of artistically treating the economical use of iron is avoided. But that which strikes me as most incongruous in this piece of the Professor's design is the use of horizontal coursed brick beams which come over the columns. There must be some secret girder, and one wonders where the injunction "Design with beauty and build with truth" comes in. I do not think any such a specimen of queer work can be found among the buildings or designs of any of the men I have been bold enough to mention. Of Mr. Aitchison's decorative designs I will say nothing, though I admit they never interested me very keenly beyond the fact that on some occasions, as with the boys and dolphin frieze in Lord Ilchester's house at the West-end, painted by Mr. W. E. F. Britten, if I remember rightly, the Professor has evinced good judgment in his choice of skilful fellow-workers. His ability in the general scheme of his decorations, as at the Goldsmiths' Hall, I do not for a moment wish to obscure. Honour to whom honour, and let justice be done. Excellent it may be for the Council of the Institute to elevate their President, for he has lately been made R.A.; but I for one consider it would have been more in accordance with real merit if the Institute and the Academy, too, had sought out Mr. G. F. Bodley, who, because he is a quiet worker, is unjustifiably overlooked. His buildings and designs justify this assertion. I know all the men I have named, but none of them are cognisant of this letter. Surely, it expresses what many must feel, even though my boldness in thus putting the case may offend the office-holders.—I am, &c.,

AN ART WORKER.

QUANTITIES AND TENDERS.

SIR,—The correspondence in your columns on the above is one of great interest to all architects, and especially in the provinces where nearly all architects prepare, or have prepared, quantities in their own offices. There are, I think, two questions that ought to be decided before an architect prepares his own quantities, for perhaps the council of the Builders' Institute know by experience the incapability of many architects to prepare a proper set of quantities—that is, if London architects' quantities are, as a rule, no more complete than many that are issued from a provincial office (though I must say my own London experience in this respect is decidedly different to the provincial). (1) Is the architect capable of preparing the quantities himself? (2) Is his practice too large to allow him to give personal superintendence to same, or does he leave them entirely to an assistant (in many cases quite unequal to the task)? If either of these objections are present, I say by all means an independent surveyor ought to be engaged; but if an architect is capable, and has time to prepare his own quantities, I say that no one else is so likely to include all his ideas and minor details necessary to complete his design as he himself is; it also assists him and saves time and trouble when detailing, and decidedly gives him a better grasp of his own work, and enables him at once, when superintending the works, to say this or that is, or is not, included, and extras and disputes would in many cases be avoided. But the provincial architect's quantities in most cases are very incomplete, and, on the other hand, many builders are as equally unprepared to price out properly a complete set of quantities when given. How seldom do we find such items as fair ends or jamb seats given on stone window sills, or mitres to skirting! Is this not unfair? The same amount of sills or skirtings in one job might have four times or more seats or mitres, as the case may be, as another job, even of equal size, all of which are time and money. A short while ago I had a set of quantities handed me for a fair-size work, and my great surprise was that any builder could be found to submit a tender on them. The items were such as these:—"No. window sashes, 7ft. by 3ft. all complete, glazed with of sheet glass. No. 1½in. four-panel doors, with linings and 3in. architraves," and so on from beginning to end. No wonder that a dispute arose at the end, which necessitated my measuring almost everything on the works. As the Institute of Builders refuse to give reasons to Mr. Williams for their objection to architect's quantities, it can well be ignored by all who are qualified to send out a properly-prepared set of quantities.—I am, &c.,

WILLIAM R. GREAVE, A.R.I.B.A.

18, Low Pavement, Nottingham.

CHIPS.

Messrs. Higgs and Hill ask us to state that their firm will be, for family reasons, converted into a private limited company, and that the business will be under the same management as hitherto. No part of the share capital will be offered to the public.

A well-attended meeting of the newly-formed Leamington Master Builders' Association was held on Saturday evening, Mr. F. W. Smith presiding. Mr. Burgess was unanimously elected secretary, and a committee was appointed to draw up rules, &c.

The light railway between Selby and Cawood, viâ Wistow, was opened on Wednesday. It is a single line of ordinary gauge five miles in length, and passes through level agricultural country. The contract was carried out by Messrs. Whitaker Brothers, of Horsford, at about £25,000.

The office of diocesan surveyor under the Ecclesiastical Dilapidations Act for that part of the diocese of Worcester which is within the county of Warwick is vacant by the resignation of Mr. J. Willmot.

A carved prayer-desk has recently been placed before the chair used by the bishop for ordinations, &c., in the choir of Salisbury Cathedral. The desk, of Italian walnut, has traceried ends surmounted with conventional foliage, and the group in front depicts Moses with his hands stayed up by Aaron and Hur (Ex. xvii. 12). The work was executed from the designs of Mr. E. Doran Webb, of Salisbury.

In the House of Lords on Monday Earl Stanhope will ask whether, in view of the decay or depreciation of the stone on the south side of the new wall of Westminster Hall, the Government will take early steps to repair or silicate the same.

An important communication came before the corporation of Dover on Wednesday in relation to the National Harbour works there, the contractors asking for extensive facilities at the east and west end of the town. The contractors desire to be allowed to take over the East Cliff Jetty, which they will extend 1,000ft. into the bay. They also propose to construct viaducts east and west of the town—that to east at a cost of £75,000, running under the cliff in the direction of St. Margaret's Bay. Arrangements are being made to start the harbour works next month.

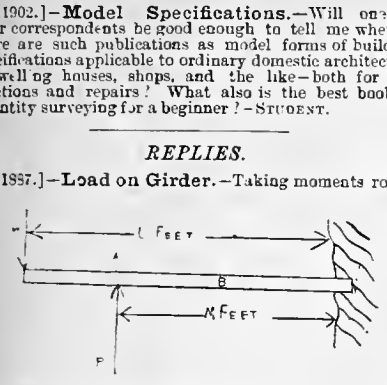
Intercommunication.

QUESTIONS.

[11902.]—**Model Specifications.**—Will one of your correspondents be good enough to tell me whether there are such publications as model forms of building specifications applicable to ordinary domestic architecture—dwelling houses, shops, and the like—both for new erections and repairs? What also is the best book on quantity surveying for a beginner?—STUDENT.

REPLIES.

[11887.]—**Load on Girder.**—Taking moments round



the point at which the girder B enters the wall, we have, if P tons be the upward pressure exerted by the girder A,

$$P \times M = W \times L.$$

Therefore—

$$P = \frac{W \times L}{M} \text{ tons.}$$

In the present instance W = 12 tons, L = 14′, and M = 10′. Hence—

$$P = \frac{12 \times 14}{10} \text{ tons} = 16{\cdot}8 \text{ tons,}$$

which must, therefore, be the amount of the pressure caused by the weight W.—J. C. PALMER.

[11893.]—**Artificial Stone.**—The stone to which you refer is called "Owen Stone," which, after a careful examination, I am convinced can be used with advantage in place of Portland. I believe the offices of the company are at 28, Basinghall-street, where, I am sure, further information will be given.—F. W. S.

[11897.]—**Penalties for Delay—Liquidated Damages.**—Much depends upon the wording of building agreement. I have lately recovered damages for delay. If "Nemo" would care to send me copy of his agreement, I would advise him. Perhaps the case of "Dodd *v.* Churton," *vide* BUILDING NEWS, March 25, 1897, p. 479, would help him.—J. H. H., The Bourne, Farnham.

[11897.]—**Penalties for Delay—Liquidated Damages.**—Though penalties are not often inflicted, it is no reason to assume that they are not sometimes enforced. It is usual to provide for the due performance of the work by fixing a sum to be paid on breach. As to recovery, the question depends on whether it is a penalty or liquidated damage. The first is conclusive on neither party, and the amount and damages suffered must be proved; liquidated damages bind both parties. It is a question of law really for the Court to decide whether the sum specified is a penalty or liquidated damages. "Ranger *v.* Great Western Railway," "Fletcher *v.* Dyche," "Crux *v.* Aldred" are cases. In one case the plaintiff, a builder, contracted to make repairs, &c., to a hours within a certain time "subject to a penalty of £20 per week that any of the works remained unfinished" after the stipulated time. It was held that the sum of £20 per week was in the nature of liquidated damages, and could be deducted by the defendant without proving the loss he had actually sustained by the delay. Consult cases also of "Law *v.* Redditch Local Board," "Sainter *v.* Ferguson"—LEX.

[11898.]—**Paint for Oak Joinery Work.**—Under the circumstances, the oak should be either oiled or wax-polished. The first process consists in sponging the wood with linseed oil, and then with a wet flannel, or woollen rubber no oil in it); rub the wood from end to end in straight rubs until it shines or a gloss appears. To wax-polish, prepare the wax as follows:—Dissolve 6oz. of pearlash in 1 quart of hot water, and add 4oz. of white wax. Let the mixture simmer for half an hour, then remove it from the fire and set aside to cool. When cold, the wax will float on top; skim this off, and with a little hot water make it into a paste, and rub the wood with this paste, using woollen rubbers, until an egg-shell gloss appears.—H. C. S.

[11899.]—**Damp-proof Course.**—If possible, clear a trench 18in. or 24in. from wall, concrete bottom, and build up brick lining in left ground, arching over at top, with air-bricks here and there. If lined inside with best asphalte so much the better. If it were possible to get Taylor's earthenware damp-course inserted in the wall of house above soil, it could only be done by piecemeal.—REGENT'S PARK.

[11899, 11900, and 11901.]—**Waterproofing Bricks, Damp Walls, and Damp Course.**—Saturate the bricks or rough-cast wall with several applications of hot boiled oil, or else linseed oil in which glue has been dissolved. This latter compound is prepared thus: Soak the glue for 12 hours until soft; then pour away surplus water, and dissolve the soft glue in linseed oil in a glue-pot (or steam-jacketed boiler). Another process which may prove satisfactory is to saturate the walls, &c., with a strong solution of gelatine in water, and before this dries on the wall, let a second person apply a solution of bichromate of potash. The result will be, if the wall be an exterior one and exposed to light at all, a coat of waterproofing gelatine is fixed in the pores of the brick or plaster. Still another waterproofing may be tried as follows. Make a strong solution of a good tallow soap in boiling water. Brush this well on the wall or plaster, and before it dries let a second person lay on a solution either of green copperas (ferrous sulphate) or of bluestone (sulphate of copper). This solution will be decomposed by the soap solution in the pores of the brick or plaster, and a sebate of iron or of copper be produced in the pores. The sebates are not permeable to water. Another way of using such sebate is to mix a solution of a tallow soap, a solution of either the above salts, collect the flocculent sebate that precipitates, and after draining this or drying off all moisture, dissolve it in hot turpentine and use the liquid on the walls as a varnish. If any of these processes are tried, perhaps a report of the result will be sent to the Editor for the benefit of the BUILDING NEWS readers in general.—H. C. S.

[11901.]—**Damp Wall.**—Undoubtedly the best plan to prevent the wet penetrating is either to render the outside with Portland cement, or, this being objected to on account of its appearance, to cover the wall with ornamental tiling hung on battens. If, however, the outside must not be touched, another good plan is to batten the inner face of the wall, and finish with lath-and-plaster. The battens might be about 1¼in. by 2in., plugged to the wall at intervals of 12in. to receive the laths. This method is not so good as the others, inasmuch as it still allows the brickwork to remain saturated with water, and simply prevents the wet appearing on the surface of plastering.—H. BESARIOGE.

[11899.]—**Damp-Proof Course.**—One remedy is to insert in lengths perforated slabs of stoneware or, better, sheets of 4lb. lead: but this is a troublesome operation, requiring underpinning. A more easy course is to remove the damp and injured plastering inside, and to cement the wall. At the same time, it is probable the earth outside is above the damp-course. If it is, form a dry area. White's composition might be applied externally instead.—H. T.

[11901.]—**Damp Wall.**—"P." had better batten his walls inside; it is the only remedy. Brick walls facing south-west are never impermeable to driving rains. I have known 14in. solid walls quite saturated; hollow walls are the only safe way of building. Have you tried Szerelmey's liquid on the outside? It has been found useful in many cases of this kind by stopping up the pores of the brick.—ARCHITECT.

LEGAL INTELLIGENCE.

THE BUILDING OF A WORKHOUSE: T. DREW-BEAR, TOLPUIT, AND BROWN *v.* THE GUARDIANS OF ST. PANCRAS UNION.—On Friday last Mr. Justice Ridley delivered judgment in the Court of Queen's Bench in this remarkable and protracted case. We reported the earlier phases of the inquiry in our issues of July 17 and 24, and November 20 and 27, 1896 (pp. 93, 133, 755, and 769, Vol. LXXI., and January 22 and 29, March 5, 12, and 19, 1897, pp. 149, 185, 365, 379, and 413, Vol. LXXII.), when it was originally heard at the Old Bankruptcy Court, Portugal-street, W.C., before Mr. Edward Ridley, Q.C. (as he then was), sitting as Official Referee; the appeal to the Divisional Court, which followed, in the BUILDING NEWS for April 16, 1897, Vol. LXXII., p. 579, when Justices Grantham and Wright set aside the Official Referee's decision against the guardians; and the decision of the Court of Appeal, consisting of the then Master of the Rolls (Lord Esher) and Lords Justices A. L. Smith and Chitty, which was reported in our issue for May 21, 1897, p. 737, reversed the judgment of the Court below, and upheld the Referee's decision, further remitting the case to be heard again by Mr. Ridley, who in the mean time had become the Hon. Sir Edward Ridley, one of the Judges of the Queen's Bench Division. That trial, which was confined to deciding the amount of such damages as could be proved to be the result of delay in giving possession of the site of the workhouse to the contractor, and of interference with the said contractor's work by sub-contractors, occupied the Court throughout the second week of January last, and is reported in our issues of Jan. 14 and 21 current volume, pp. 77-8 and 110. Mr. Reginald M. Bray, Q.C., and Mr. A. A. Hudson appeared for the plaintiffs, and Mr. English Harrison, Q.C., and Mr. William Moyses for the defendants, a singular feature of the case being that the junior counsel on either side were formerly in practice as architects. In giving judgment on Friday, Mr. Justice Ridley remarked that the case was one in which he had to assess the damage to which he might consider the plaintiffs were entitled to according to the judgment of the Court of Appeal. As he understood it, the judgment of the Court of Appeal laid down the rule that the plaintiffs were entitled to damages by reason of the contractor not having been allowed to get possession of the site in question at the proper time; but they were not entitled to claim anything in respect to damages that might result from the acts of the architect; it was not, therefore, a case in which it could be said that the whole of the contract was at an end, and the plaintiffs were entitled to recover on a *quantum meruit*, but the amount of damages to which the plaintiffs were entitled must be ascertained in respect to such injuries as resulted to the contractor not being granted by the guardians possession of the site of the proposed buildings. The evidence which had been called on the several heads of the damage was of a general character, the witnesses examined before him speaking on their experience as surveyors or builders, and giving their opinion as to the percentage a builder would find his outlay increased if he did not obtain full possession of the site. That class of evidence, he considered, appealed to anyone's common-sense, because if a contractor had four or five blocks of buildings to erect it was obvious in a moment that it was of the greatest consequence that the whole site should be clear, in order that the builder could map out his work, and so get it pressed forward that each part should help the other. If the contractor were compelled to build one portion at a time, the work became dislocated, and the greater the number of buildings he had to erect the worse became this dislocation. That was the nature of the present case. It was indeed some time before he personally arrived at the conclusion that it was of so much importance in this case. No doubt the interference by the architect did involve delay to some extent; but he thought that the real cause of the mischief which upset the calculations of the contractor and the expectation of the guardians as to the completeness of the work was mainly due to the fact that possession was not given of the site. That was the way the contract was broken. On the other hand, it should not be forgotten that on the previous occasion it was the plaintiffs who contended for the most part during the inquiry that the architect was the person who had prevented the job being carried out, and certainly he did interfere more than usual in respect to materials brought on the site and to work done on the job. In the second inquiry as to the damages, the case was reversed, because the plaintiffs, who formerly contended that by reason of that interference the undertaking was prevented from being carried out, said, on this second inquiry, that the real cause of the delay was not getting possession of the site. The truth of it was that although there was undoubtedly some delay occasioned by the interference of the architect, common sense suggested that the real cause of the delay was the failure to give possession of the site. It was very unfortunate that this was not done. It was now necessary to deal with the different heads of damage put forward. He certainly did not intend to go through the entire history of the case afresh. He had considered the matter as well as he was able on the materials laid before him. The first head of damage claimed was in respect to the increased cost of the labour by reason of the delay in getting possession of the site. The witnesses called for the plaintiffs had calculated this at the large sum of £6,357. That amount was established by a strong body of evidence as the ratio or proportion which in the building trade would be attributed to the failure of getting possession of the site. On the defendants' part there was no evidence whatever of any account. There was, indeed, no contradiction of plaintiffs' witnesses, and nobody was called or put forward to say they were not to be credited. The position taken by the defendants was that it was not right according to the judgment of the Court of Appeal that this should be taken into consideration; but he thought it was. In dealing with such a case as the present, he thought he ought to be guided by the opinion of those who understood the trade. He believed it was within the decision of the Court of Appeal that he should assess the damages to the best of his ability on the materials put before him. The percentage given by Mr. J. T. Chappell and other witnesses was not contradicted. He did not mean to say he was prepared to accept it to its full extent. He thought that they had not perhaps given sufficient weight to the fact that in this case the architect did interfere, and that he certainly did prevent, to a great extent, the carrying out of the work. He must, therefore, take off a considerable margin in respect of such interference by the architect, and he must also consider whether the whole of the case put forward by the plaintiffs was exactly made out. He did not think that the claim of interference upon the roads by the traffic of the guardians was made out by the plaintiffs. What he had been able to arrive at on this head was that in lieu of the £6,357 claimed by the plaintiffs they were entitled to £4,000. Then there was the claim for the increased price paid for labour from and after September 1, 1893. That he had included in the sum of £4,000 already named, and he should add nothing under that head. In the same way as to the profit of 10 per cent., that also was included in the sum of £4,000. As to the claim for interference by sub-contractors, he thought, looking at the evidence given, that it was exaggerated, and that the sum of £250 was as much as the plaintiffs were entitled to in respect to that matter. Next, as to the claim arising from the increased price paid for materials on and after September 1, 1893, although somewhat in dispute, he considered that on the whole it had been shown that the prices of materials generally were raised a good deal then. He could not, however, estimate the loss under that head at as high a figure as the plaintiffs had done, but they certainly ought to be awarded £500 for such increase. Concerning the claim for establishment charges, he allowed another £1,250. The charges as to loss of profit and failure to get possession of the capital outstanding, he had put together and allowed the sum of £1,000 under those heads of claim. The total of all the sums he had named was therefore £7,000. Mr. Bray, Q.C., applied for costs, on the ground that the defendants had only paid into court the sum of £2,500. Mr. Justice Ridley: You are, I think, entitled to the costs of this hearing. The Court of Appeal has already dealt with the costs. Mr. English Harrison: Then, technically speaking, your Lordship's judgment will be for £4,500, in addition to the sum paid into Court? Mr. Justice Ridley: Yes. Mr. English Harrison: Will you allow me a stay of execution

for about three weeks to consider the effect of your Lordship's judgment? The money is absolutely safe. Mr. Bray demurred, asking whether they had had not enough of this case. The learned Judge said he thought so. He could not delay anybody's execution in this case. He did not wish to stop people from taking appeals; but had there not been enough litigation in this matter. Mr. English Harrison pressed his demand for a stay of execution for three weeks, remarking that his clients had to go through a process to get the money, and that he did not therefore think the request unreasonable under the circumstances. His Lordship granted stay of execution for a fortnight, adding that the plaintiffs would, of course, be entitled to the £2,500 paid into Court in part satisfaction of their judgment.

CHARGE AGAINST A HASTINGS BUILDER.—At the Hastings police-court on Friday, Luke Lutner Langridge, builder, of Hollington, was brought up on remand charged with being a person in respect to whose estate a receiving order had been made, did unlawfully quit England, and take with him a certain sum, part of his property, above the amount of £20 in money, which ought by law to be divided among his creditors, contrary to the statute. Prisoner, who was arrested at Capetown, took with him in November two cheques—one for £275, drawn on a Mr. Colt's account as an advance by way of mortgage on property at Hollington; the other was for £18 18s. 7d., drawn by Sayer and Colt, local solicitors, for balance of purchase money due to him in respect to the sale of a house. Prisoner reserved his defence, and was committed to take his trial at the Quarter Sessions, bail being granted.

A RECALCITRANT BUILDER FURTHER FINED.—Mr. George E. Bainey, a builder, of 22, St. Dunstan's-road, Forest Gate, was summoned to Stratford police-court on Saturday by the East Ham Urban District Council for penalties in respect to non-compliance with an order made by the Court. In October the defendant was summoned and fined £5 for failing to remedy certain sanitary defects at 46, Rutland-road, East Ham, a house owned by him. An order was also made to do the work, with a continuing penalty of 10s. a day till it was done. But the defendant did not do the work, and the council thereupon stepped in and remedied the defects at a cost of £1 8s. 10d. The work was completed on January 14. Mr. W. B. Whittingham, the chairman, said it would be useless for the Bench to make orders of this sort unless they were enforced. The previous order of the Court would now be adhered to, and defendant would have to pay 10s. a day from the date of the order till the date of the completion of the work—viz., 67 days. Defendant must also pay £1 8s. 10d., the cost of the work done by the council, and 10s. 6d. Court costs, amounting in all to £35 9s. 4d.

THE CENTRAL LONDON RAILWAY TUNNELS.—At the Sheriff's Court, Red Lion-square, Holborn, on Wednesday, a case of importance to owners of property along the lines of the new electric railways was heard by Mr. Burchell and a special jury. It was a claim by the trustees of the late Frederick J. Blake against the Central London Railway Company for £539 for the purpose of repairing the residence No. 2, Marlborough-gate, Hyde Park, alleged to have suffered damage by subsidence due to the works of the railway company. It was alleged that the house in question had been structurally injured by the works of the company either primarily or by reason of the bursting of a water main owing to the tunelling operations for the company's new line from the City to Shepherd's Bush. Amongst the experts called for the claimant were Mr. H. H. Collins, Mr. Arthur C. Pain, Mr. E. A. Gruning, and Mr. Henry Currey. On behalf of the railway company, Sir Douglas Fox, Mr. Cooper, Mr. George Weston, and others gave evidence, and it was contended that the system of tunnelling with the Greathead shield prevented any possibility of injury to adjacent buildings, and that the subsidence must have been caused by the bursting of the water-main owing to internal pressure. The jury returned a verdict for the railway company, on the ground that the damage was done by the bursting of the water-main, for which the railway company had not been shown to be in any way responsible. It was agreed that the claims pending in respect of adjoining houses should be governed, as regards the question of liability, by the finding of the jury in this case.

HARROGATE WATERWORKS ARBITRATION.—Mr. Shiress Will, Q.C., made his award on Friday in connection with the Harrogate Corporation taking over the interests of the Harrogate Waterworks Company. The sum claimed by the company was £231,000, and the offer of the corporation before Parliament was £187,000. The umpire's award is £187,000. Under the conditions of the award, the unspent capital of the company, £2,363, and the reserve fund, £5,499, are to be set against the award.

The organ in Dagnall-street Baptist Chapel, St. Albans, was reopened last week after being enlarged by Messrs. Hill and Son, of London.

Our Office Table.

SIR EDWARD J. POYNTER'S cartoon of St. David, which is an elaboration of the design prepared by that artist some years ago for a companion mosaic to the St. George, which fills the panel over the entrance to the Lords' corridor in the central hall at Westminster, is approaching completion; and Mr. Akers-Douglas hopes that before Parliament reassembles next year the work of reproducing it in detail in the panel over the entrance to the Commons' corridor will have been executed to the satisfaction of members interested. It may be remembered that last session a sum of £750 was voted in the Estimates towards the completion of the scheme of mosaic decoration in the central hall. A further cost of something like £200 is expected to be incurred during the forthcoming financial year.

MR. JOHN ALEXANDER BRODIE, M.Inst.C.E., of Cook-street, Liverpool, has been selected by the health committee of that city from 52 applicants, and will be recommended for appointment to the post of city engineer of Liverpool. Mr. Brodie, who is only 30 years of age, received his early training in the Coburg Dock of the Mersey Dock Board, next entering the Liverpool Corporation service, and afterwards practised as a civil engineer in Liverpool on his own account. He is Vice-President of the Liverpool Engineering Society, a Whitworth Scholar, and a member of the Institute of Civil Engineers. The commencing salary attached to the city engineership of Liverpool, which became vacant by the resignation of Mr. H. Percy Boulnois, since appointed an inspector under the Local Government Board, is £1,000. The other four selected candidates for the post were Mr. J. Patton Barber, M.Inst.C.E., surveyor to the vestry of St. Mary, Islington; Mr. E. J. Lovegrove, Assoc.M.Inst.C.E., engineer and surveyor to the Urban District Council, Hornsey; Mr. Philip H. Palmer, M.Inst.C.E., borough engineer and surveyor of Hastings; and Mr. A. E. White, M.Inst C.E., city engineer of Hull.

IMPORTANT changes are, says the London correspondent of the *Manchester Guardian*, likely to take place before long in the surveying branch of the Department of Works and Public Buildings. Sir John Taylor, K.C.B., who has been chief surveyor for many years, contemplates retirement from his office in the course of the next few months, and it is expected that he will be succeeded by Mr. Henry Tanner, his chief assistant. But although Sir John Taylor gives up the onerous and responsible office in which he has long served the Crown, his services will not be completely lost to the department. It is understood that he will superintend the erection of the new War Office on what is known as the Carrington House site in Whitehall, as he has had much to do with the preparation of the plans for that building, and it would be manifestly convenient for him to see them carried out. As the houses now occupied by the Office of Works in Whitehall-place will be pulled down in connection with the War Office scheme, the First Commissioner and his staff will remove to Storey's Gate in the course of the ensuing summer.

AT the meeting of the Plymouth Town Council on Tuesday, a recommendation by the borough surveyor and the special works committee of a new code of by-laws for regulating building operations in the borough was adopted. These proposals are of a very far-reaching character. Should they obtain the force of law, it will be no longer possible to lay out streets 24ft. in width, or to crowd houses on the land to the exclusion of proper means of approach. Greater regard will also have to be paid to the size of rooms, and to the manner of the erection of buildings, especially those designed for human occupation. Under the new regulations the width of streets is to be increased, there is to be no such thing as a "cul-de-sac," and there are to be back lanes. Under by-law 4, a street not more than 100 yards long is to be 36ft. wide, one of 200 yards 40ft. wide, and over 200 yards 45ft. wide.

THE first of three lectures was delivered by Dr. Jean Paul Richter at the Royal Institute on Thursday in last week, the special topic being "Some Italian Pictures at the National Gallery," the paintings of the 14th century. The National Gallery had one peculiar feature in its favour in that it possessed a not inconsiderable assemblage of the works of the Italian Trecento, the first brilliant period of the national art of the peninsula. But how far did these represent the great artists of that time? To Cimabue many works had been ascribed by Vasari, but these were so heterogeneous that it was impossible they should all be his. The Madonna of the Capella Rucellai in Florence must, on the grounds of style, be attributed by every unbiased critic to Duccio, not Cimabue, while the doubt was fully warranted that the altarpiece in the National Gallery ascribed to the latter master was not his at all, but could only be ranked as a schoolpiece of Duccio's. Of the school of Giotto there were many examples in the National Gallery, but not a single one of them could claim to come from the hands of the master himself. Only those who had seen his wall-paintings at Assisi, Padua, and Florence could appreciate the greatness of his art. The lecturer considered that little instruction was to be gained from the Florentine painters of the Trecento in the National Gallery, though in numbers they were more largely represented there than in any other public collection except at Florence. The one great Florentine painter of the Quattrocento who was most closely allied to the art of the Trecento was Fra Angelico, of whose work the National Gallery possessed one example of supreme merit in the "Resurrection of Christ." Dr. Richter concluded with a few words about the Trecento pictures of the Sienese school. Though Siena was only 30 miles from Florence, each city was an independent centre of art, and did not influence the other in the slightest degree. In the National Gallery there were four panel pictures by Duccio, who was the founder of the early school of Siena, the first place being taken by the triptych representing the Madonna with the saints Dominico and Catherine of Alexandria on either side. Of the other three the "Transfiguration" alone was in its original condition.

ON Saturday evening an art lecture was delivered in the Glasgow Corporation Art Galleries by Mr. T. L. Watson, F.R.I.B.A., his subject being Glasgow Cathedral. The chair was occupied by Councillor Dougan, M.D. The lecturer referred to the influence upon the development of Gothic architecture exercised by the numerous fires which occurred in the large churches of the 11th and 12th centuries. In order to make their religious buildings enduring as well as beautiful, the whole energy of the designers was directed to the problems of covering them with stone vaulting, and this resulted in the evolution not only of the arch rib vault, but of the pointed style of architecture. The earliest building of importance at Glasgow, the church erected by Achaius in the early years of the 12th century, was destroyed by fire in 1176, and a parallel to this was found in Canterbury, where the choir of the cathedral, erected at the same time as the church of Achaius, was burnt down in 1174. The rapidity with which the rebuilding of the choir at Canterbury had been carried out was contrasted with the prolonged operations under Bishops Jocelyn, Walter, and Bondington at Glasgow. The choir and lower church of Glasgow Cathedral were described in some detail and illustrated with a series of views. This part of the building was almost wholly of the 13th century, a period when there was no appreciable difference between the architecture of Scotland and that of England. We had thus the broad basis of English archæology to ground upon, and in contrast with other parts of the building and many other buildings in Scotland, its architecture was particularly clear. The architecture was of five distinct dates, each separated from the others by an interval sufficient to mark the development of the style. This development was indicated by a change of general design and by the introduction of a new type of moulding in the vaulting ribs in each section, which formed a regular sequence and illustrated the development of vaulting during the 13th century. The lecturer afterwards dealt in detail with the sequence and approximate dates of the various portions of the structure, and with the methods and machinery employed in erecting large buildings such as the cathedral in the 13th century.

THE first examination by the Illinois State Board of Examiners of Architects was held on Jan. 15. Nineteen candidates for licenses to practise were examined, and eighteen were accepted. In addition to these eighteen, how-

over, more than 600 architects already established have received licenses, under the provision of the law which entitles those who can satisfy the examiners that they were in actual practice in the State on the 1st of July, 1897, to a license without examination; and others, making application as practising architects, who have not yet received their papers, will undoubtedly obtain them. So far, 788 applications have been made. Several of these are from persons residing outside the State who desire permission to practise within its limits; indeed, architects in other States, who have clients in Illinois, cannot do work for them there without a local license.

A REPORT has been submitted to the Statute Labour Committee of Glasgow Corporation by Mr. John Lindsay, clerk of police, on the cost of taking over and maintaining the foot-pavements in the city. Excluding the footpaths of private streets, the extent of those of public streets is approximately 2,000,000 square yards, but including the footpaths of private streets, the above extent would be increased by one-fourth, giving a total extent of 2,500,000 square yards. Assuming that before the footpaths were taken over by the corporation they were put into a condition to the satisfaction of the master of works, the approximate annual cost of maintaining the same would, for public streets, be £8,500, and as regards private streets a further annual sum of £2,125. These sums are exclusive of the cost of subsequent renewal when completely worn out. This cost is, as regards public and private streets, estimated at £12,248 per annum, and in this sum no allowance is made for snowfalls. Mr. Lindsay explains that the foregoing figures are based on the assumption that the corporation possesses the power to take over all the footpaths in the city, but the corporation possesses no such legal power.

THE annual meeting of the Trustees of the Manchester Royal Infirmary was held on Friday. The report set forth the arrangements which have been made for the sale—if sanctioned by the corporation and the general body of trustees—of the land surrounding the infirmary. Three members of the medical staff opposed the proposal to retain the present infirmary and build a new one in some other place, holding that a fully equipped hospital might be built on the present site without encroaching on the open space. Eventually, on its being made clear that the adoption of the report in no way committed the trustees to the scheme approved by the joint committee, the report was approved, with the addition of a sentence declaring that the scheme, if accepted by the corporation, would be submitted to a special meeting of the trustees. It was urged by some of the trustees that it would be better to sell the whole of the present site and buildings and build a new hospital elsewhere, than be subject to the disadvantages of having two institutions.

WE have received from Messrs. Sissons Bros. and Co., Ltd., of Hull, a sample of Hall's "Sanitary Washable Distemper," which is a new sanitary water-paint of great excellence. It is a strong disinfectant, and destroys all insects, vermin, as well as disease germs; yet it is free from caustic and alkali, and is non-poisonous. It is also perfectly washable three weeks after being applied. It may be put on a damp wall, and will stand better than oil-paint. Moreover, it will not scale off, and can be painted on or varnished without sizing. It is made in all colours, either rich, dark shades, or light tints, and as there is no lead in its composition it will not turn black, as many similar preparations do from the sulphurous gases in the atmosphere. Cracks and holes may be filled with the stiff material, which sets harder than plaster of Paris. It is readily applied, requiring no solution or liquid other than hot or cold water for mixing it ready for use, and it can be applied by inexperienced persons without difficulty. It is very economical in use—1lb. of water added to 4lb. of the distemper covers more than 25 square yards.

The parish church of All Saints', Leigh, Gloucestershire, which has been rebuilt from plans by Mr. C. E. Ponting, F.S.A., of Marlborough, was reconsecrated last week.

At a meeting of the Barnsley Town Council on Feb. 9, the plans of the proposed new opera-house to be erected in Eldon-street were approved and passed. The plans have been prepared by Mr. John P. Briggs, of 1, Arundel-street, Strand, London.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. "The Mediæval Campanili of Rome," by J. Tavenor Perry. 8 p.m.
Surveyors' Institution. "Legal Liability for Professional Opinion," by T. W. Wheeler, Q.C., A.P.S.I.
Carpenters' Hall Lectures. "Electric Motive Power," by Professor Silvanus P. Thompson, F.R.S. 8 p.m.
Society of Arts. "The Principles of Design in Form," Cantor Lecture No. 2, by Hugh Stannus. 8 p.m.
Liverpool Architectural Society. "Some Notes on St. George's Hall," by F. E. Pearce Edwards, A.R.I.B.A.

TUESDAY.—Institution of Civil Engineers. "Alternate-Current Motors," by Llewellyn B. Atkinson; and "Dublin Electric Tramway," by H. F. Parshall. 8 p.m.
Society of Arts. "The Regalia of England," by Cyril Davenport. 8 p.m.
Auctioneers' Institute. "Furniture: Past and Present," by W. Roland Peck, F.S.I., Vice-President. 8 p.m.
Leeds and Yorkshire Architectural Society. Discussion Night.

WEDNESDAY.—Society of Arts. "Children's Sight," by R. Brudenell Carter, F.R.C.S. 8 p.m.

THURSDAY.—Society of Arts. "Egypt the Birthplace of Architecture," by G. A. T. Middleton, A.R.I.B.A. (illustrated by lantern views). St. James's Hall, Piccadilly, W. 8 p.m.
Northern Architectural Association. Social Gathering of Sketching Club. Assembly Rooms, Barras Bridge, Newcastle-on-Tyne. 8 p.m.

FRIDAY.—Architectural Association. "Leadwork," by F. W. Troup, A.R.I.B.A. 7.30 p.m.

THE ARCHITECTURAL ASSOCIATION.

FEBRUARY 25th, ORDINARY GENERAL MEETING, No. 9, Conduit street, W., 7.30 p.m. Paper by Mr. F. W. TROUP, on "LEADWORK, PLAIN AND DECORATIVE" with practical demonstrations.

FEBRUARY 26th, SPRING VISIT to Claridge's Hotel, Brook-street, Grosvenor-square, W., by kind permission of the Architect, Mr. C. W. STEPHENS. Members to meet at the works at 2.30 p.m.

E. HOWLEY SIM, } Hon. Secs.
G. B. CARVILL, }

The Society of Architects.

Founded 1884. Incorporated 1893.

The FOURTH ORDINARY MEETING of the Society of Architects for the Session 1897-98 will be held at the Rooms of the Society, at St. James's Hall, Piccadilly, W., on THURSDAY, February 24th, 1898, at Eight o'clock p.m., when a Paper will be read by Mr. G. A. T. MIDDLETON, A.R.I.B.A., Member), entitled "EGYPT, THE BIRTHPLACE OF ARCHITECTURE," illustrated by limelight views. Ladies' night.

ELLIS MARSLAND, Hon. Sec.
MONTAGU BALDWIN, M.A., Sec.

Trade News.

WAGES MOVEMENTS.

ASHFORD, KENT.—A settlement of the threatened dispute between employers and workmen in the building trade has been arrived at on the basis of a halfpenny per hour advance all round, and this to take effect from March 14. The employés reserve the right to raise the question of a further advance to skilled labour in 12 months' time if the state of the trade should warrant it.

CARDIFF.—Masters and men in the building trade of Cardiff met in conference on Wednesday night in last week, the former at the Royal Hotel, and the latter in the Gladstone Hall. Earlier in the day a joint conference was held between the representatives of both sides, lasting from 11 o'clock till 3.30, but no decision was arrived at. The representatives from both sides submitted the proposals to a general meeting in the evening, and the masters' association confirmed the proposals made by their representatives. The employers' meeting closed at 10 o'clock. The men's meeting was more protracted, and in the event was adjourned. The masters, therefore, await the result of the deferred meeting.

EDINBURGH MASONS AND EIGHT HOURS.—In accordance with the agreement come to between employers and men, the masons in Edinburgh and Leith commenced on Tuesday to work the eight hours' shift, the time-table ranging from seven a.m. to five p.m., with two hours off for meals. The arrangement has been generally observed.

PLYMOUTH.—In October last the Plymouth Journeymen Painters' Association gave their employers six months' notice of their intention to demand an increase of wages and a shorter number of working hours per week. Considerable negotiations have taken place on the matter, and terms have now been arranged which are said to be satisfactory to both parties.

The death is announced of Mr. Benjamin Suart, for many years managing director of Messrs. Maw and Co., Limited.

HADLEIGH, SUFFOLK.—For the supply of fire-hose and apparatus, for the urban district council:—

Salter, A. W.	£12	10	0
Graham and Joslin	58	7	6
Firmin and Co. (accepted)	57	14	3

GOSPORT.—For factory at Gosport, for Messrs. C. Mumby and Co. Mr. W. H. Fry, Gosport, architect:—

Lear	£1,495	0	0
Light	1,475	0	0
Corke	1,422	0	0
Crockerell	1,400	0	0
Dash	1,389	0	0
Jones (accepted	1,350	0	0

HIGHGATE.—For the erection of new infirmary, &c., at Highgate Hill, N., for the Guardians of the Poor of St. Mary, Islington. Mr. W. M. Smith, A.R.I.B.A., 65, Chancery-lane, W.C., architect. Quantities by Mr. H. Dow White, 52, Finsbury-pavement, E.C.:—

Gough, F., and Co.	£203,045	£4,640
Patman and Fotheringham ...	201,474	4,937
Leslie and Co.	199,707	4,486
Chessum and Sons	198,450	4,500
Martin, H.	197,462	4,760
Patrick, J., and M.	195,547	6,315
Wall, C.	195,000	4,300
Gray Hill, C.	186,500	5,063
Kirk and Randall (accepted)	181,523	4,269

A.—Extra for white glazed bricks above dado.

HORTON, NEAR EPSOM.—For alterations to the Manor House, including the erection of boiler-house, chimney, and two lodges, and for the erection of temporary buildings, for the London County Council:—

Erection of temporary buildings:—

Kelly, E. C. and J.	£77,793	0	0
Gough, F., and Co.	72,897	0	0
Harbrow, W.	70,489	0	0
Hawkins and Co.	68,762	11	1
Kirk and Randall	68,000	0	0
Humphreys, Ltd.	66,553	0	0
Leslie and Co. (accepted	64,263	0	0

Alterations and additions to Manor House:—

Leslie and Co.	22,429	0	0
Harbrow, W.	21,711	0	0
Kirk and Randall (accepted ...	20,812	0	0

KEYHAM, DEVONPORT.—For the enlargement of the Seaman's Barracks, for the Lords of the Admiralty:—
Debnam, A. R., Mount Pleasant,
Plymouth (accepted) ... about £200,000 0 0

LEEDS.—For carrying-out the excavations, masons', and bricklayers' work at the new meat market, for the city council:—
Wright, A. J. (accepted) £2,543 0 0
[In lieu of tender from Gould, originally recommended for acceptance at £2,763.]

LIVERPOOL.—For painting and decorating the rooms on the upper floor of the Town Hall, for the corporation:—
White, A., Duke-st., Liverpool ... £3,998 12 9
Recommended for acceptance.)

LIVERPOOL.—For the erection of a plinth and railing in Prince Alfred-road, for the corporation:—
Dilworth, Isaac (accepted) £589 0 0

LONDON.—For pulling down and rebuilding the George the Fourth p h, Portugal-street, Clare Market, W.C., for Messrs. Hoare and Co. Messrs. Reed and Perry, 9, Johnstreet, Adelphi, W.C., architects:—

Dove Bros.	£8,325 0 0
Knight, H., and Son	8,295 0 0
Hall, Beddall, and Co.	8,242 0 0
Holloway Bros.	8,176 0 0
Clarke and Bracey	8,028 0 0
Perry and Co.	7,740 0 0
Patman and Fotheringham	7,440 0 0

LONDON.—For various works at the under-mentioned schools for the London School Board:—

Jessop-road School—Providing teachers' closets outside building and reconnecting existing closets to children's offices, and providing drainage:—

Garratt, J., and Son	£1,335 0 0
Castle, W. and H.	1,327 0 0
Johnson and Co.	1,289 16 0
Higgs, F. and H. F.	1,269 0 0
Bowyer, J. and C.	1,258 0 0
Goad, W. V.	1,241 0 0
Maxwell Bros., Ltd.	1,219 0 0
Parker, G.	1,183 0 0
Akers, W. and Co.*	1,118 0 0

Canterbury-road School—Providing infants' cloakroom, additional lavatory accommodation, and skylights in classrooms:—

Ford, J. F.	£629 0 0
Goad, W. V.	625 0 0
Hammond, W.	573 0 0
Triggs, E.	554 19 0
Line, H.	495 0 0
Jones and Groves	449 0 0
Leney, H.	447 0 0
Rice and Son*	429 0 0

Albion-street School—Inclosing, draining, and tar-paving the additional land:—

Williams, R. E., and Sons	£930 0 0
Johnson and Co.	650 0 0
Ford, J. F.	648 0 0
Marsland, J.	485 0 0
Line, H.*	419 0 0

Weston-street School—For providing and fixing a partition to divide large room in girls' department:—

Brittain, G.	£139 0 0
Musgrove, S.	138 14 0
Oldman, J. and A.	92 10 0
Tucker, E. B.	88 19 0
Wake and Dean	88 0 0
Line, H.*	79 0 0

Lant-street School—Providing and fixing hot-water coil in infants' class-room and fixing tubular boiler:—

Cannon, W. G., and Sons	£42 0 0
Grundy, J.	36 9 0
Ellis, J. C. and J. S., Ltd.	34 10 0
Davis, G.	32 0 0
Berry, Campbell, and Co.*	28 10 0

Edinburgh-road—Providing and fixing hot-water coils in corridors, and fixing tubular boilers:—

Rosser and Russell, Ltd.	£107 5 0
May, J. and F.	106 0 0
Gray, J.	99 0 0
Vaughan and Brown, Ltd.	92 0 0
Comyn Ching and Co.	88 10 0
Wontner-Smith, J., Gray, and Co.	73 18 0
Davis, G.	70 0 0
Grundy, J.*	61 7 0

Dalgleish-street School—Providing and fixing hot-water coils in corridors (boys', girls', and infants') and in one classroom (boys' and girls' respectively) and two classrooms (infants') and fixing tubular boilers:—

Ellis, J. C. and J. E., Ltd.	£149 10 0
Gray, J.	149 0 0
Comyn Ching and Co.	134 10 0
Defries, J., and Sons, Ltd.	130 0 0
Strode and Co.	130 0 0
Fraser, J., and Son	109 0 0
Simmons, W.	107 15 0
Cooper, W. J.*	101 0 0

Weston-street School—Providing and fixing hot-water coils, and fixing S.B. stoves in two large classrooms (boys') and one large classroom (girls'), and fixing tubular boilers; fixing S.B. stoves in one large classroom (infants'):—

May, J. and F.	£120 0 0
Rosser and Russell, Ltd.	112 10 0
Ellis, J. C. and J. S., Ltd.	109 10 0
Defries, J., and Sons, Ltd.	101 10 0
Strode and Co.	97 0 0
Strong and Collings	79 0 0
Clarke, J. F., and Sons*	78 15 0

Royal Normal College—Repairs to buildings, &c., on a running contract:—

On schedule prices for repairs.

Akers, W., and Co.	+ 20 per cent.
Bowyer, J. and C.	+ 20 ,,
Garnham, J., and Son	+ 20 ,,
Stewart, J.	+ 15 ,,
Leney, H.	+ 12½ ,,
Poole, W., and Son	+ 12½ ,,

Supply of English eight-day dial clocks on a running contract:—

Warren, R. J.	each £2 9 6
Benson, J. W., Ltd.	,, 2 7 6
Bowley, J.	,, 2 5 0
Monks, W. H.	,, 2 2 0
Sainsbury, W. A.	,, 2 2 0
Meader, J.	,, 2 0 0
Stockall and Sons*	,, 1 15 0

* Recommended for acceptance.

Burdett-road Congregational Church School—Adapting premises for a temporary school:—

Holliday, J. F.	£505 0 0
Kybett, J.	492 0 0
Barker, G.	464 0 0
Jackson, T. H.	459 0 0
Symes, A. E.	428 0 0
Robey, J. T.	421 0 0
Gibb, D., and Co.*	409 0 0

Harwood-road School—Infants': Fixing tubular boilers and four large S.B. stove fronts. Boys': Fixing four large S.B. stove fronts:—

Comyn Ching and Co.	£153 10 0
Wontner-Smith, J., Gray, and Co.	109 15 0
Cannon, W. G., and Sons	98 15 0
Defries, J., and Sons, Ltd.	96 0 0
Clarke, J. F., and Sons	91 0 0
Stevens and Sons*	82 5 0

LONDON.—For sundry alterations to 15, Castle-street, E.C., for Mr. Chas. Parkin. Mr. C. R. Winter, architect:

Jarvis and Son	£314 0 0
Battley, J. R.	298 0 0
Harborow	257 0 0
Irwin, W.	247 0 0

LONDON.—For the reconstruction of drainage and other sanitary works at the infirmary, St. John's Hill, S.W., for the Guardians of the Poor of the Wandsworth and Clapham Union. Mr. Thos. W. Aldwinckle, F.R.I.B.A., architect. Quantities by Mr. Bernard Swinstead:—

Aries, S.W., and Co.	£6,826 0 0
Garrett and Son	5,349 0 0
Roome, E. A.	5,134 0 0
Wall, H., and Co.	5,125 0 0
Johnson, W., and Co.	4,975 0 0
McNeil, D.	4,766 0 0
Beattie, R. P.	4,675 0 0
Bostel, D. T., and Sons	4,575 0 0
Gardner and Hazell	4,492 0 0
Barrett and Power	4,489 0 0
Roffey, H. (accepted)	4,200 0 0
Flemming, J., and Co.,	3,764 0 0
Knight, J., and Sons	3,730 0 0

LONDON.—For the erection of a block of flats (Block 1) at Sloane-court, Chelsea, S.W. Mr. Paul Hoffmann, 152 and 153, Palmerston-buildings, Old Broad-street, E.C., architect. Quantities by Messrs. Dunk and Bousfield, Billiter Square-buildings, E.C.:—

Allen, J., and Sons	£18,950 0 0
Britton, F.	18,900 0 0
Kearley, C. F.	18,610 0 0
Grover, J., and Sons (accepted)	18,178 0 0

MAIDSTONE.—For building a coal-store at the sewage works, for the corporation:—

Burrows, W. T. (accepted)	£81 15 0

(Lowest tender received.)

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2251.
FRIDAY, FEBRUARY 25, 1898.

MODEL SPECIFICATIONS.—I.

WE propose, at the suggestion of several correspondents, to take up the subject of specifications—one that, from various causes, has been much neglected by architects. The very few books that have appeared on the subject have dealt with specifications in a more or less general and formal manner, or have been deficient in many items of modern requirements. They have, therefore, been of scarcely any use except as mere outlines. Two or three admirable works have appeared dealing with the subject in the form of items, data, or "notes," two of which have appeared in the Building News in a series of articles; but, as far as we know, the student and architect of to-day are without any complete set of model clauses. There are three methods of treating the subject, which we may call A, B, and C. Method A.—Taking a given building of a particular kind, and describing the work *seriatim* trade by trade. Method B.—Taking the trades in rotation, and giving clauses for ordinary and superior qualities of work. Method C.—Giving model or typical clauses for special kinds of work. There are advantages in each method. The first plan can only be of service when the building described is "on all fours" with the one proposed to be erected. A set of clauses for a small villa, for instance, would be of no value as a guide for a specification for municipal offices or a shop. As a skeleton outline it may be of some service, but for general application to other buildings it has no value. The young practitioner is chiefly in want of a carefully-compiled and comprehensive series of items or clauses as an aid to the memory, and which he may be able to adapt to the particular work he has in hand. He wants to know, in short, what and how to specify—in other words, specimen clauses for the principal kinds of work in each trade, adapted to different classes of building. Perhaps it may be a clause for the drainage of a building, or a brickwork clause. If he can find one that can be easily adapted by a few minor changes—as, e.g., sizes of pipes or qualities of brick—it is of value. If, for example, his design shows a quantity of rubbed red brickwork in reveals and arches cut and gauged, it will be of assistance to him to find suitable clauses. Or he may want a clause describing an underground reservoir, or the mode of constructing a waterproof cellar, or a good clause for half-timber work or tile hanging; in each of these cases he is anxious to meet with a clause that will express his requirements within a little. For these reasons we think the methods B and C are of more essential use to him, and we therefore intend in these articles to follow those modes of dealing with the subject. We shall fill in the materials and sizes where it may be necessary to do so as a guide, adopting in preference those which are used in the best work; and we shall give, when necessary, alternative clauses, or insert the substitutes in brackets. In the matter of timber scantlings and stone details, of course, every building must be studied by itself, so that any dimensions given may be misleading.

In covering so large a ground, embracing as it does all the trades connected with building. It will be impossible to deal with every item or condition that may occur in practice; nor do we pretend to be infallible in our methods or opinions. Our object is not to write a treatise of construction, or to supply data on materials and scantlings which are dealt with in detail by other treatises; but rather to frame, unhampered by convention, or ordinary usuage, clauses that may be taken as specimens or models for ordinary building requirements, omitting matters that have only reference to special circumstances, and confining our attention to those leading requirements applicable to most buildings. We shall probably not please everybody; but we shall be glad to receive from practical correspondents any suggestions they are willing to offer.

Specifications vary greatly in their matter and form;—every architect has his own formula, and in different localities we find many diverse uses. The chief want of the architect is a series of forms for clauses that will embody his requirements in a clear and concise manner. A verbose clause is often ambiguous, or its punctuation is faulty, or the sentence may be so involved that the builder or contractor interprets it in a sense that is not intended, or evasively turns the circumlocution to his own advantage. A short one is often so general as to be of no use whatever. Between verbosity and extreme brevity, the architect requires to make a choice, so that definition and clearness be both attained. There is another point. We require to choose between a "cut and dried" form, with its set formula of words, and that vague and incoherent composition so tiresome to practical men. The former often lacks meaning, the latter is tedious.

What should a specification comprise? A good principle to guide the specification writer is to make it embody every detail and item about which the drawings give no information or are obscure thereon. One ought to throw light on the other. As a rule it is very far from doing so, and perhaps the worst thing for the young practitioner to do is to follow the drawings too closely. It is better for him to think and reflect, to revolve in his mind what is necessary on this floor and on that, in this room and the other, and to take up a bill of quantities to refresh his memory. Mr. Leaning's little book on specifications will be a help in this direction. Numerous items like special window and door frames, sound-boarding, stoves, glazing, &c., often go undescribed if a regular course is not pursued. Many specifications are commenced when the general drawings only are ready, the consequence being that important details are overlooked; but if the details are prepared as they should be, greater brevity is insured, as the details can be referred to. These may be numbered or slightly sketched in margin. If when the drawings are being prepared notes are made during their preparation of anything that occurs to the architect, much trouble in these matters would be saved. In writing a specification, begin either at the top or bottom of the building—the latter preferably, and maintain the same order. It is necessary also to observe an order or sequence in every trade, as it assists the memory, and helps to avoid omissions. Thus, in describing such trades as joinery, it is advisable to adopt some order, as floors, skirtings, windows, doors; those of deal first, afterwards those in oak or other hard wood. In describing sashes, their thickness, section of bar, linings; or in doors, the number of panels, the thickness of framing, if plain or moulded on one or both sides, how hung, what linings, &c.

There are some who think the specification should be given to the surveyor to write. Mr. Leaning, in his excellent work on "Quantity Surveying," says: "It is an advantage to have the specification written by the man who takes off the quantities; he checks his own work thereby, and it is better completed before the quantities are lithographed, so that any errors therein may be corrected." From an architect's point of view, this opinion is open to question. If the specification is merely to be regarded as a means of contracting or tendering, or as simply to guide the quantity surveyor, then, of course, there could be no objection to the arrangement; but if the specification is to be regarded as an architect's document, only second to the plans and drawings, descriptive of his intentions and supplementary to them, it should always be prepared by the architect. No doubt it is a desirable plan that the architect should submit the specification to the surveyor for amendment or correction before the quantities are prepared, and sometimes a meeting is convened between them to go through the items for this purpose.

We do not propose to give a form of general conditions, as circumstances vary so much that the architect is the best judge in each case of the particular conditions required, and the Institute "Schedule of Conditions" gives a very complete list of conditions that may be varied to suit special cases; but it may be useful to enumerate certain preliminary conditions which apply to most cases, and we may name these under the general head of

PRELIMINARY.

1. At this early stage the architect should prepare a plan of the site, with the datum level and other particulars. The levels of ground should be carefully taken before the plans or specifications are prepared; thereby much uncertainty as to the depth of footings, drainage, and other matters are avoided. Inattention to this often leads to serious misunderstandings between contractor and architect, and to great divergences in the tendering, especially as to the Excavator and Bricklayer's work. In most specifications we have seen, the Excavator's work has been very vaguely described as to the depth of excavation, the soil to be removed or the distance it is to be carried. But this information cannot be given unless levels are taken over the site, and these are marked in clear figures, say red or blue, on the site plan. In some cases, as when the ground is irregular, sections are necessary, showing the original levels and those which are required at the completion. When architects begin to realise more than they do now the value of laying out the site and surroundings of their buildings, they will take more pains in specifying where the excavated material is to be placed; if any depressions and cavities in the ground are to be filled up, and if a terrace on one or more sides of the building is to be formed.

2. Before tendering it is necessary that the contractor should make himself acquainted with the site, and by the aid of the levels and plan, see what is required to be done. Drainage of site and superfluous water must also be considered.

3. In town sites, it is necessary to inclose the site with a post-and-rail fence or a hoarding, allowing for cart entrances, and plank footways, in accordance with the regulations of the local authority or vestry.

4. In the building or alteration of street premises, the question of shoring the party and external walls, floors, and roofs has to be considered, and the requirements of the London Building Act (1894), especially the sections relating to lines of building frontage (Part III. section 22, &c.), to dangerous structures (section 102, *et seq.*); to additions to and alterations (sections 207-211, &c., or to provisions in the by-laws under the Public Health Act, 1875, have to be taken into account, also the rights of adjoining owners.

5. The old materials of any existing building to be removed; the cleaning, stacking, and re-use of old bricks.

6. When there are no dimensions given in the plans or drawings, the architect is to have the power to decide the same, and

should there be any omission in the specification the contractor is to call the attention of the architect to it, and, in any case, supply what is necessary.

7. It is necessary also for the contractor to consider the water supply, the carriage, plant, pumping, and other appliances the machinery, hoisting, travelling expenses, lodging, and other requirements of his men.

8. Lighting is often an item of consideration in some cases. In foundation work, where constant pumping is necessary, or in completion of short-time contracts, gas or electric lighting may be necessary.

9. The removal of rubbish from site before the excavations can be commenced; storage of materials under cover like lime and facing bricks; sheds for the same; clerk of works' office, and other temporary fittings, have to be considered.

There are many preliminary clauses which ought to be inserted before the specification of trades, and which apply to all. One of these relates to the attendance of one trade on all the others. Thus the joiner is expected to attend on bellhanger, and to make good after him, to cut away for pipes, and to make necessary casings after plumber's work; the plasterer also has to make good after plumbers, bell-fitters, gas-fitters, &c. In alteration, or in the demolition of an old building such a clause as this may be necessary:—"Inclose by proper boarding the adjoining premises, and carefully shore up and support the roof and floors of house on the — side before removal of the party-wall, &c."

It is customary also to insert a clause mentioning any provisional sums to be made in any trade; as, for example:—

"Provide the sum of, say, £500 for heating apparatus. Provide the sum of £200 for stoves. Provide the sum of £1,000 for internal decorations, &c."

These sums are often expended as the architect may direct, or they are to be paid *net* to the tradesman selected on the architect's certificate, or the sum may be deducted from the contract. The contractor is to render all facilities, scaffolding, &c., for the execution of these works; a provision for packing and carriage is to be allowed in each case. When these provisional sums are provided, the architect generally selects any special manufacturer or tradesman. When the contractor pays for them, a discount of 10 per cent. is allowed, this percentage being considered sufficient on these provisions.

THE DESIGN OF THEATRES.

THAT so little has been done to make our playhouses worthy of the drama and of the sites which they occupy is perhaps attributable to the same national indifference to art which finds frequent expression. The average Englishman is, it must be confessed, a very undemonstrative person, and his feeling for art or anything else artistic is to be measured more or less by the amount of profit or mere utility which may be made out of it. The "play-sense" has never been strong in him; he is naturally disinclined to favour anything that is sentimental or poetic, and in many other ways, whether in public or private, in ceremony, in ritual, in the æsthetic pleasures, he shows a marked *sang-froid*. But with the greater facilities of travel, the introduction of wider sympathies, and Continental ideas, the average Englishman is improving. Mr. Edwin O. Sachs, in his interesting paper on the "Housing of the Drama," which we reported in our last issue, points out what the individual holder, lessee, or manager desires—that it is, in short, a matter of pounds, shillings, and pence to him. He considers only the audience within the auditorium; comfortable seats upholstered "up to date"; gilding and paint. "The London manager has only to cater for the pleasure of a sensation-seeker practically devoid of any feeling for architecture and with little reverence for dramatic art." It is quite true, and it is this sort of ephemeral pleasure-for-the-moment craze that is studied. The great outside public who seldom enter theatres are not considered at all; the comfortable seat or box-holder is all that is catered for by the builder, and his or her taste for art or architecture is often only to be measured by the quantity of plush velvet or gilding that he obtains for his patronage. The consequence of this taste is not far to seek. We have practically no theatre in London, save perhaps the Palace, which is at all designed on architectural lines. Many of them are splendidly equipped and upholstered and decorated within; but we cannot point to one that is architecturally conceived, where the separate parts like the auditorium and stage and entrances are designed in reference to their functions, and are made to assume externally a building worthy of the English drama. The Shakespeare Memorial Theatre at Stratford-on-Avon is alone the one monumental building we have, and this was built by subscriptions. Many theatres, forsooth, are dirty squalid-looking exteriors, mere brick walls with a portico tacked on in front, or are so hampered and concealed by adjoining houses and shops, like most of those in the Strand and West End, that they cannot be dignified by the name of architecture at all. We enter a vestibule or crush-room of small dimensions, embellished by gilt and mirrors, and lighted by gas or the electric light, and then have to struggle through a dark unventilated passage till we enter our box or stall. Then the "glories" of the real building burst upon the view; it is indeed, after all, but a diminutive affair, but embellished with all sorts of manufactured articles—decorated plasterwork, paint, upholstery, and gilt. All is cased in plaster or shams of one sort or another—little solid work. A firm of decorators or upholsterers are engaged to turn out the whole thing; architecture ceases at the entrance. Nor can we wonder, if we take into account the tenure, the financial complications—in fact, the commercial basis of the London and provincial theatres. In most cases they are speculations; the buildings are leased, not erected for the ostensible purpose of providing a home for the drama. But the lack of architectural character is owing to the position assigned to the play. On the Continent, we find the Court subsidises the municipal and subscription theatres; the playhouse is regarded as educational and recreative in some Continental towns; in others, the building is presented and endowed by some wealthy citizen. Compare a building erected for dramatic representations in this manner, and another erected by a private individual as a commercial undertaking. The motives that prompt them are different; one is to produce a monumental building in which the Muses are enthroned. No expense is spared to produce a building that shall be an ornament to the site. The donor builds it, not as a commercial investment, but as a source of recreation under municipal management; the motive, not the profit, is the consideration. In the commercial undertaking the architect is cramped, the art is lost sight of, and the question is, What will pay? and the design is generally put in the hands of men who know something of the planning and working of theatres. Any architect who is the "run" with the theatrical profession, and can assist financially, is employed. He is generally within the "charmed circle," and the more he knows of the stage the better. Those who have read Mr. Darbyshire's book and his remarks on his own experience as one who has had to do with many theatres in Manchester and London will at once appreciate this attitude. Then the essentially technical demands of theatre construction have to a large extent called for special experience, and have estranged the architect from this class of building. He has to be expert in planning of entrances and exits of different classes of the public; to be acquainted with the latest improvements in fireproof construction, in hydraulic and other appliances, lighting and other details—matters which it would take a lifetime almost to master. These are all conditions unfavourable to an architectural conception. It is curious indeed that buildings connected with our amusements and recreations are not worthy of better treatment. Anything is thought good enough in the shape of a building, and the most temporary structures are built for these uses, even for housing our national art collections at South Kensington.

One of the main weaknesses of our architectural work in this direction is the lack of relation between plan and external design. A good plan is often marred by a poor elevation or an exterior that would do bare justice to a factory or warehouse. We have nothing like the Court Theatre, Vienna, or the Paris Opera House to point to, where fenestration is made a conspicuous part of the exterior façades. Everything here is lavished on the proscenium boxes and the decoration of the interior. In the first of these the architects, one of whom was Gottfried Semper, aimed at expressing internal arrangement. It is true the site or surroundings of these buildings favoured the monumental style. Semper's great structure was based on the radial planning of the auditorium, and the graceful arrangement was the result, with its segmental grand vestibule and foyer. Here, as Mr. Sachs says, the exterior expressed every part of the interior planning. Buildings dedicated to the drama have in this country at least been designed with little reference to external effect. No doubt the situation of many of our London theatres has made it almost impossible to study more than one front. The late Mr. Phipps, in Her Majesty's Theatre, we lately illustrated, had the opportunity of doing something better, and the result is certainly a step in advance; but still there remains much to be done to make the buildings of the English opera and playhouse rank with those in other departments of our national architecture. Plan and external design must be studied together; the architect ought again to master the problem of planning, instead of relegating the duty to experts and decorators who are content to allow the exterior to remain as a mere shell or case of an elaborated, and often extravagantly embellished, nucleus.

TOP-LOADED BUILDINGS.

THE terrible disaster which befell a political meeting at London, Ontario, recently recorded, and which caused the deaths of twenty-two persons and serious injury to a hundred others, comes as another warning to architects and projectors of public buildings. A crowded meeting had been held at the City Hall, followed by a conversazione. From the reports published, it appears the floor gave way, precipitating upwards of 200 persons on to the floor beneath, which, in its turn, gave way, landing the mass of the assembly in the cellar. To add to the horror of the situation, and to the injuries inflicted on the hapless crowd, an immense safe fell amongst them, as well as a heavy steam coil. What could have been more disastrous and appalling? From the evidence of the city engineer, a heavy compound beam below the floor gave way, and it is stated the beam was composed of "twelve timbers each 3in. by 4in. securely jointed together." It broke in the middle, rolling all the people on this part of the floor into one mass. The

engineer states that he did not consider the hall was dangerous, but the great weight of the enormous crowd caused the beam to break.

Till the case has been thoroughly investigated, it would be unwise to attach blame to anyone in particular, or to draw any definite conclusions as to the cause of the catastrophe; but, at the same time, the question will at once occur to the practical mind,—"Why so large a crowd of people should have been allowed to assemble in a room two stories high without additional precautions having been taken?" Even so simple a thing as a stout post or baulk resting on a plank on the lower floor, and supporting the beam somewhere about its centre, would, in all probability, have averted the disaster, as the load on the beam in such case would have been reduced by a fourth, as the strength varies inversely as the length of the beam. The load of the people on the beam was inferentially a distributed load, and we know experimentally that a beam can carry twice the load when equally diffused over it than it can if concentrated in the centre. Probably some sudden tread or stamping of the crowd caused the fracture; but of these details all must be conjecture. Possibly there was a defect in the material of the beam itself; or the parts of which it was built may not have been properly bolted together. The reports received are clearly incorrect as to the composition and size of the beam. One of these says the beam was composed of twelve timbers, each 3in. by 4in., which must be a mistake. The dimensions, 3in. by 4in., are absurd on the face of it for a solidly-built beam, but these particulars will shortly be known. The sizes of the timbers rather suggest a trussed beam of wood, in which case the size would be intelligible. The profession interested in these matters will be glad to know how the beam was constructed, and of what composed, and the immediate cause of collapse. But the sad fate of so large a number of people, their precipitation through two floors, suggests the more general inquiry why a city hall should be placed in such a position. We have always strongly objected, for several reasons—chiefly panic caused by fire, and want of means of escape—to assembly-rooms being placed on upper floors. We know the practice is common even in this country for the large hall of a municipal building to be placed on the first floor above the offices, so as to command a better or more prominent position in the elevation; but for the reasons we have named, we consider a public hall should be placed on the ground-floor level, if possible. To overweight a building on the top floor is always dangerous, and any vibration or sway of a crowd in such a position must involve greater risk on the construction by putting undue stress upon the floors and walls. Great loads anywhere in a lofty position are undesirable, for the simple reason that the centre of gravity is shifted from its natural position. As to the heavy safe and coil case which loaded the floor, inquiry also is demanded whether these had proper brick walls or piers to stand on; but we wait for information.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary meeting of the Institute was held on Monday evening at 9, Conduit-street, W., Mr. H. Louis Florence, vice-president, in the chair. A paper, illustrated by numerous pen-and-ink drawings, executed by the author, was read by Mr. J. Tavenor Perry, Fellow, on

THE MEDIÆVAL CAMPANILI OF ROME.

In his introductory remarks, after alluding to the references to these familiar towers in the works of Willis, Lockyer, and Papworth, Mr. Perry commented on the fact that so little was known of the history, or had been written about them, and urged the great necessity of some detailed record of them, since already many had disappeared, and all were falling into a state of serious dilapidation. Having given a list of the campanili still standing, the author pointed out that tower building was a tradition of Roman Classical times, and mentioned those built by Pliny, Augustus, and Diocletian, and representations of those which have been found, particularly that on a ceiling discovered in the Farnesina gardens by Professor Lanciani. The first recorded erection of a bell-tower in Rome is that of St. Peter's, in the middle of the 8th century, which was restored by Leo III. a few years later. In giving an abstract of the principal events in Mediæval Roman history, as related by Gregorovius, an attempt was made to show that only during very limited periods were building operations possible in Rome, and that the most important of these was the time of Leo IV. after the repulse of the Saracens. The details of the construction and decoration of the towers were described in relation to their likeness to or divergence from Classic examples, particularly in reference to their arcades; and an attempt was made by a comparison between these and the windows of some English towers known as "Saxon" to establish the theory of their early date. Mr. Perry asked: "Whence did the Saxons derive their ideas on this subject? Not from the scanty vestiges of antiquity still remaining in the island, not from France or Germany, where such features were unknown; but from the only place where they could by any possibility exist—Rome itself. Alfred the Great, entering St. Peter's for the coronation of his father, Athelwulf, had before him the great campanile of Stephen and Leo, and, when leaving, from the steps of the atrium, he may have seen the campanile of St. Michele of the Saxons in the Borgo, much as we see it now." A comparison was further made between the dated examples of towers both in North and South Italy, such as those of Milan, Amalfi, &c., with a view to show that the Roman examples were of an earlier date. The niches on some of the towers were described, and it was suggested that these were not intended for statues, but to shelter sacred paintings, of which great numbers reached Rome from Byzantium in the time of Leo the Iconoclast. The majolica decorations were mentioned as indications of date, those on SS. Giovanni e Paolo being assumed to be coeval with the tower, and painted for the position they occupy. In conclusion, an account was given of the state of dilapidation into which most of the campanili had fallen, and the damage which had been done to them by injudicious restoration or repair.

Mr. R. Phene Spiers, F.S.A., proposed, and Mr. H. H. Statham seconded, a vote of thanks to the lecturer. This was supported by Mr. William Woodward, and was carried by acclamation. Mr. Perry briefly replied.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.

THE thirty-first annual meeting of the donors and subscribers was held at the offices of the Institution, 21, New Bridge-street, E.C., on Tuesday evening, the president-elect, Mr. R. C. Foster (Messrs. Foster and Dicksee), occupying the chair, supported by Mr. Thomas Hall (retiring president), Mr. E. Brooks (treasurer), Messrs. E. B. Gammon, F. S. Oldham, H. W. Parker, C. K. Turpin, W. Seymour, E. C. Roe (son of the late lamented E. C. Roe), J. C. Amphlett, and other gentlemen. The secretary read the report, which stated that the amounts received in the past year were £271 8s. 6d. in subscriptions, £396 0s. 6d. in donations, £148 10s. in dividends, and £2 2s. 11d. as interest on deposit. There was also a balance from the dinner account of £8 16s. 5d., making a total for the year of £826 18s. 4d. The disbursements amounted to £506 12s. 6d., of which sum £418 8s. 4d. was given in pensions and temporary relief. There are twenty pensioners now on the books. Referring to the orphan fund, there is a vacancy at the present time, and the committee are prepared to receive applications on behalf of intending candidates. The nineteenth annual dinner was held in the King's Hall, Holborn Restaurant, on Tuesday, April 6th, 1897. The appeal made by Mr. Hall, the president, was most successful, the amount announced being £391 16s. 6d. The committee fully realised the value of Mr. Hall's services, not only in connection with the dinner, but for all he had done throughout the year in helping forward the work of the institution. It being known that much distress existed amongst some of the pensioners, it was thought that a good way of celebrating the Queen's Diamond Jubilee would be to increase the amounts of the pensions—the men's being raised from £25 to £30 per annum, and the widows' from £20 to £24 per annum. The limit of income (apart from the pension) being extended from £25 to £35 per annum. The increase made was greatly appreciated by the pensioners. Referring to the presidency, the committee announce with pleasure that Mr. R. C. Foster has kindly accepted the office in succession to Mr. Hall. The committee concluded by thanking the professions and trades identified with the building interests for their continued support. The President-Elect, in moving the adoption of the report, remarked that he had been looking over the acounts; but it did not seem needful to say much about them, as "good wine needed no bush," and as to the work done generally, as shown in the report, to say much in its praise would be like gilding the pill they were asked to swallow. The institution was to be congratulated on the success that had attended its operations since its establishment. There were now some things he would specially refer to. In the first place, the previous year's income had been the largest yet received, a fact to be noted. Then, again, looking at the income, and the expenses incurred, he noticed that of every twenty shillings received the expense of working amounted to 2s. 2d. only, leaving 17s. 10d. available for use along the fighting line, and it might be well if this could be followed by other societies. In looking through the list of previous presidents, he felt it to be quite a new departure in asking the representative of a country firm to become president of a London institution; but he hoped this would not matter. He might not have the chance of emulating the out-going president, Mr. Hall, but he hoped to do his best, and especially as he had a new field to travel. He had received valuable help from the secretary, and had done his best to digest the various documents that had been laid before him. He would conclude by moving the first resolution, to the effect that the report and balance sheet be adopted and printed, together with the list of subscribers and rules. Mr. E. B. Gammon seconded, and the resolution was duly carried. Mr. Brooks proposed, and Mr. Parker seconded, a vote of thanks to the retiring officers, which was carried. Mr. Thomas Hall, the retiring president, replied briefly, saying he had spent a very pleasant year, and was sorry it had come to an end, and thanked the officers for the help he had received during his presidency. On the motion of Mr. Oldham, seconded by Mr. Turpin, officers for the present year were elected, and the meeting closed with a hearty vote of thanks to Mr. Foster for his kindness in accepting the presidency, and his services in the chair.

EGYPT THE BIRTHPLACE OF ARCHITECTURE.*

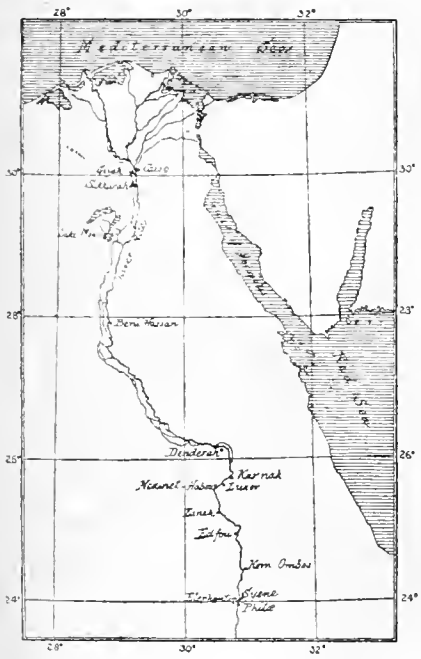
EGYPT is, so far as has been ascertained, the fountain-head of all civilised architecture, and being a country of peculiar climate, the remains of even the most ancient works have been handed down to us in a remarkable state of preservation, so that we are able to trace their history back in a manner which would have been otherwise impossible. Besides this, again, the monuments have been covered with inscriptions, both by those who erected them and by their successors, and modern research having enabled these inscriptions to be read, the history of the country and of the buildings alike has been revealed. So far as it has been possible to ascertain the facts, it appears that the generality of the people have been at all times agriculturists, subject to despotic and often foreign rulers, who have made them their slaves. Thus, whenever the throne has been occupied by those who have been inclined to build, there has been ample slave labour available, both for the actual erection of the buildings and for the transport of materials, to bring limestone from the hills bounding the Nile valley, or granite from Syene. The dates given by various authorities both to buildings and rulers are very confusing; but, according to Mariette, there were thirty different Dynasties of heathen Kings or Pharoahs between the years

* Paper read by G. A. T. Middleton before the Society of Architects last night (Feb. 24).

5004 B.C. and 378 B.C., divided into three great periods, thus :—

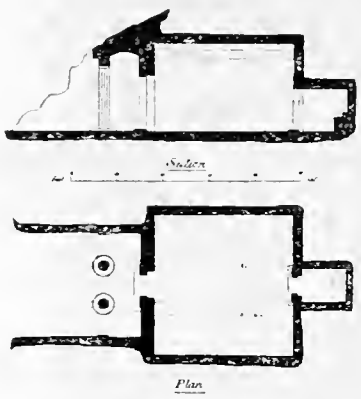
1st Period	Thinite and Memphite	1st to 10th Dynasties.
2nd Period	Theban (Ancient) 2466 B.C. to 1702 B.C.	12th to 17th Dynasties.
	Theban (New) 1702 B.C. to 966 B.C.	18th to 21st Dynasties.
3rd Period	Saïte (Old) 966 B.C. to 527 B.C.	22nd to 26th Dynasties.
	Saïte (New) 527 B.C. to 378 B.C.	27th to 30th Dynasties.

Then, after a short gap, came the period of Grecian rule, under the Ptolemies, commencing 332 B.C., the first Ptolemy having been a general under Alexander the Great; and this is followed by Roman occupation in the year 30 B.C., Egypt subsequently for a long time forming part of the Byzantine Empire, as it has remained feudatory to Constantinople even to the present day. The building epochs also arrange themselves into four great groups, marked, as might be expected, by great divergencies of style, which may be arranged as follows :—(1) Pyramidal or Memphite, during the 4th Dynasty; (2) Proto-Doric or Early Theban, during the 12th Dynasty; (3) Theban or Late Theban, during the 18th and 19th Dynasties; (4) Ptolemaic, during the times of the Ptolemies and the Romans. Between these periods the throne seems to have been occupied by kings who devoted themselves to other arts than that of architecture, or the country appears to have been in a state of disorder, as during the rule of the Hyksos, of which little is known, between the 12th and the 18th Dynasties. The earliest buildings existing are all of the nature of tombs. It seems that the Egyptians, with some vague idea of the Resurrection such as has been possessed by many heathen races, had a belief that the body would come to life a second time some 3,000 years



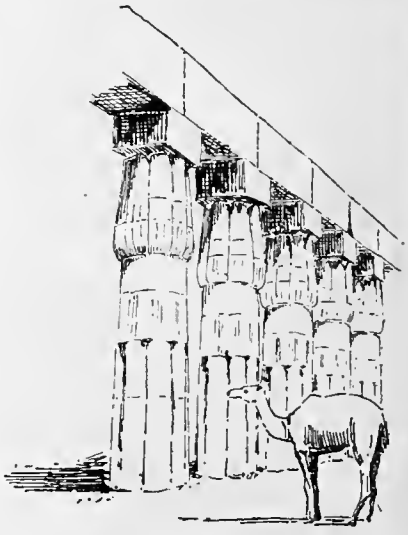
EGYPT.

after death, if properly preserved. Hence the mummies and the solid tombs. These latter first took the form of square-based pyramids—evident successors to simple tumuli or heaps of stones; and the earliest of these of which remains exist is the Great Step Pyramid at Sakkarah. Accepting the earlier dates in all cases with caution, its erection is generally ascribed to Ata, King of Egypt, about 4300 B.C. Besides this, all that is known of it is that it consists of six huge steps of limestone masonry, arranged one upon another until a rough pyramidal form is attained, the steps being respectively 38ft., 36ft., 34ft., 32ft., 31ft., and 29ft. high. If there were any intermediate stages between this and the perfect pyramid, they have been lost; but of these latter there are many examples, the principal group being at Gizeh, near Cairo, and the principal one of the group being the famous Great Pyramid of Cheops (or Khufis), which is supposed to have been erected about B.C. 3733. Each side of its base measured about 760ft., and its vertical height 450ft.; but its actual dimensions are difficult to determine, as the original granite casing has all been removed, and only the limestone core remains. The granite casing is said to have been so perfectly worked that not even a thin piece of paper could be passed into the joints; and this is still the case with the



TOMB .. BENI-HASSAN.

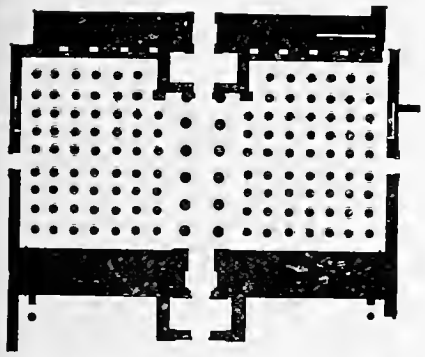
granite lining to the passages with which it is traversed, and which penetrate even into the rock upon which it is built. How the blocks could have been worked so perfectly, and how raised into position when worked, still remain unsolved problems to the present day. The fact of the tomb chamber having been found unoccupied when explored has caused the promulgation of many theories as to the reason for the existence of the pyramid at all, one of an exceedingly fanciful nature being that it was a prophetic building erected by Melchisedech, and another, put forward by a well-known astronomer, being that its passages, and the groves along their sides, were intended to perform the office of huge telescopes for the observation of certain stars at certain times. If the remains of the pyramidal epoch be few, even though colossal in size, those of the succeeding period, the Proto-Doric, are fewer still and small withal, but they make up for this by foreshadowment of greater things to come elsewhere in later ages. Some half-dozen dwellings were excavated during the 12th Dynasty, and about the year 2300 B.C., in the limestone escarpment bordering the Nile Valley at Beni Hassan, these being subsequently used as tombs upon the death of their inhabitants. Reference to the plans will show that the arrangement was that of a single chamber with the roof supported by columns, not built up, but simply left out of the solid rock when the chamber was excavated. In the principal case there is also a smaller chamber within, evidently used as the tomb; and in that, as in most instances, a verandah was formed in front of the entrance by carrying the overhanging rock there also by columns. The arrangement is precisely that which might be expected in a small flat-roofed timber house in a hot country, from which the inspiration is most evidently taken; as is seen at once by examination of the front of the verandah, for the columns have small abaci, representing bearing-pieces of wood, between their tops and the lintel which they carry. This lintel is in the form of a horizontal architrave or beam of wood, and above it are representations of the ends of longitudinal rafters such as would carry the flat roof; while large flat circular discs are employed as bases, again, like the abaci, to act as bearing pieces, this time to distribute the weight of the columns over the surrounding surface. In reality, however, the parts are not pieced together as the above description might lead one to suppose, but the whole is left of solid rock, without joint. A great deal has been made both of this plan and of this elevational arrangement, as being the prototype of not only its immediate successors, the Egyptian Temples of later Dynasties, but of the Grecian Doric order. The plan of a prostylar temple consisting of a simple cell, with side walls extended in front and columns placed there so as to form a verandah or entrance, is here seen clearly enough; but whether the temple plan was derived direct from these tombs or from the type of building from which these tombs were also derived, and which must have been in common use for several hundreds of years, is questionable. So, too, it is with the general features of the elevation—and perhaps it is more interesting to believe that these tombs merely represent in stone a type of building, common for a long period of time, proving it to have been of exceedingly ancient origin, than to imagine that the inspiration of the Grecian temples was taken direct from them without any connection across the many centuries between their dates. The most curious feature, however, is the occurrence of flutes, or hollow sinkings, in the verandah-supporting columns of the principal tomb. There are sixteen sides to each column, and each side is slightly hollowed as if to emphasise the arris, or edge—and similar flutings appear, at a much later date, in the columns of the Greek Doric order, there being no known examples at intermediate periods to carry on the sequence. As to the origin of these there have been many theories, but probably the columns were first left square (as they still are to some of the tombs), then octagonal by the removal of the edges, then sixteen-sided; and then, looking awkward, the sides were sunk for emphasis as said above. In another of the Beni-Hassan tombs there are two transverse rows of three columns each, the columns forming quatrefoils on plan, being composed of four reeds of large size, or possibly representations of four circular wooden posts of small section, bound round near the top by representations of grass binding, the interstices being filled with short fillets. Above this binding the reeds swell out, forming a bud-shaped capital, and above the capital is a shallow abacus. The columns taper considerably, and the form is one which came into very general use later on. As usual, the theorists have been busy as to its origin; but it is, perhaps, best to record only that which is obvious. Between the 12th and the 18th Dynasties there is an unbridged gap



Colonnade.
LUXOR.

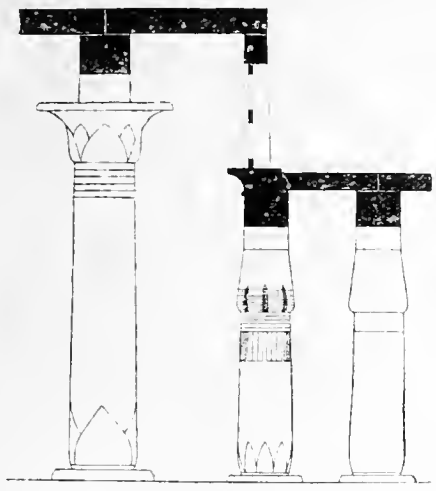
in the history of Egypt, all that is known being that it was overrun by the Hyksos or Shepherd kings. It was evidently a time of disorder, and no buildings of the period remain. With the 18th Dynasty, however, there opened the greatest building epoch which Egypt ever saw, the Theban Period, as, also, this time was that of Egypt's greatest prosperity. Then it was that the Israelites were captives in Egypt, Rameses II., the third king of the 19th Dynasty, being generally believed to have been the Pharaoh who withstood Moses. The great buildings of this period are all close together at Thebes, further up the Nile than Beni-Hassan, and now take the form of huge temples arranged upon a well-thought plan, one story only in height, but majestic and awe-inspiring in appearance. Externally they were simple, forbidding structures, with plain walls inclined inwards, and crowned with the invariable simple cavetto cornice, and with entrance at one end only, between huge masses of masonry called "pylons," in the form of truncated pyramids, again with the cavetto cornice crowning them. Internally, the arrangement was always symmetrical round an axial

passage-way, so managed that when standing at the main entrance a view was obtained through the entire length of the temple to the shrine of the deity at the extreme end. This would be as impressive a view as could well be imagined, through sunlit courtyards and dark pillared halls alternately, with brilliant, nay gaudy, colouring used lavishly upon the walls and columns. The great temple (or palace—probably both) at Luxor, a fairly typical example, was erected in three stages. The earlier portion dates to, at least, 1500 B.C.—the time of Amenophis III., a king of the 18th Dynasty. It consists of the shrine, with a great number of small chambers round it, then, in advance, a deep pillared hall, opening along its entire width into a great courtyard, with double colonnade on either side, the whole being closed by a pair of massive pylons with the entrance gate between. Later on another hall, comparatively narrow, with two rows of columns down its length, appears to have been added, another pair of pylons with entrance between being erected. So far the usual axial arrangement was preserved, but in making the subsequent addition of another open courtyard, with a double colonnade all round, and with yet fresh pylons at the new entrance, the axis has been lost, and the plan of the courtyard is not rectangular. Of a slightly later date is the temple at Karnac, it being generally ascribed to the time of Seti I. and his son Rameses II., circa B.C. 1400 to 1333. Its general arrangement is very similar to that of the temple of Luxor, save that a small temple has been inset into the side wall of the outer courtyard by Rameses III., as late as 1200 B.C.; and an outer pair of pylons was added again much later, in the Ptolemaic period. From the outer courtyard is



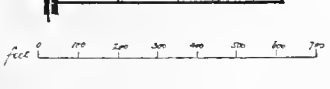
Hypostyle Hall, Karnac. Theban Period.

entered a great pillared hall, famous as the Hypostyle Hall of Karnac. The axial passage of the whole building lies between two rows of columns, 60ft. high, resting on circular discs as bases, then swelling suddenly and afterwards tapering to a capital which is of bell form. The abacus above, instead of being a thin broad bearing slab as at Beni-Hassan, is cubical and comparatively small. This central passage is roofed with flat stones in the usual way at a high level, but on either side are several rows of lower columns, carrying a roof at a lower level, light being admitted to the central portion by a series of clerestory gratings or openings. The shorter columns very much resemble the reeded columns at Beni-Hassan, having a bud-shaped capital of exceedingly similar character; but they have a swelling or entasis, as have the tall columns, and are circular, and not reeded in section. This, however, is not a necessary peculiarity of the period, for reeded examples are to be seen at Luxor, though the entasis is always present, and the abaci are small cubes which do not appear to bring the weight at all well upon the capitals. The ornamentation, it may be remarked, was generally painted and not carved during the Theban period, with the exception of the symbolical winged-globe, which appears in bold relief in the cavetto cornice over every doorway—and excepting, too, the hieroglyphic inscriptions and representations of scenes from everyday life which are commonly found incised upon the wall surfaces. It seems that the ornamentations of the columns generally took the form of representations of reeds, and leaves, and binding straw bands, as if the column had originated in bundles of reeds or posts, and not in large tree-trunks or in monolithic quarry supports. Contemporaneous with the temple at Karnac, and undoubtedly of the time of Rameses II., is the Ramesseum. It again exhibits the same characteristics of arrangement, as does also the temple of Medinet Habou, erected by Rameses III., the first king of the 20th Dynasty, about 1200 B.C. So exceedingly conservative were the Egyptians in their religious rites, as



Part Section through Hypostyle Hall, Karnac.

well as in their general mode of living, the son always adopting the father's trade and working according to his rules and methods, that even in the three hundred years of the Theban period of architecture little variety is to be found. Even in the later examples, as at Medinet Habou—and of course it will be understood that there are many smaller monuments which are not mentioned here—there is but slight change noticeable. There is the same extreme vigour and imposing strength, but sculptured figures are now more often found in front of, and even attached to, the square supporting columns of some of the colonnades and halls. The sculptor's art had reached a high state of perfection at a very early date, but its productions do not appear to have been directly connected with the buildings till somewhat later, and then gradually more and more. Still, it was at all times most architectural in character, harmonising in its massive solemnity in a most wonderful manner with the tombs and temples. Following strict laws of proportion and posing, it may be called conventional portraiture of the highest order; and so little variety of method is to be noticed that it is exceedingly difficult to understand the great distance of time between the erection of the great Sphinx, which, close to the Pyramid of Cheops, is by many authorities contemporaneously dated, and the well-known portraits of Rameses II. Obelisks, too, were during the Theban period frequently used as architectural features, being erected in pairs, as at Karnac, outside the entrance-doors and pylons.



THE RAMESSEUM.

Besides the erected temples, some few were excavated in the rock during the 18th and 19th Dynasties, the most important being that at Abu Simbel (Ipsamboul), of the time of Rameses II., and that at Mount Barkal, the date of which is more difficult to determine. The simplicity of arrangement noticeable at Beni-Hassan is no longer preserved, that of the axial passage-way being followed, with every other detail of the open-air temples, so far as was possible under the changed conditions; save that at Abu Simbel side chambers are to be found, as if they were subsequent excavations. It was only the inner portion of the temple of Mount Barkal, however, which was excavated, the two outer courts or halls having been built against the face of the walls. At Abu Simbel it was different. All there was rock-cut, and the entrance was made as nearly as possible to represent a magnificent pylon, with four colossal seated figures attached to and excavated out of the face of the rock. Inside, in the entrance hall (representing the colonnaded open court of the erected temples) are two rows of huge standing figures, certainly much smaller than the external statues, but still 60ft. high each, which appear to carry the roof, but which are, in fact, quite clear of it, looking straight in front of them, as all Egyptian statues do, apparently ignoring poor, feeble, pygmy man, with his short existence of three score years and ten. Wonderful and noble edifices are these temples of the Theban dynasties of Egypt; and a small point of additional marvel has recently been brought to light and announced by Professor Goodyear in the *Architectural Record*, of New York, in the fact that the courtyards of Luxor, Karnac, and Medinet Habou—and also that at Edfou to be mentioned presently—are not quite square, the cornice lines at least being always somewhat curved convex to a spectator standing within the court, the curve being sufficiently subtle to be unnoticeable from below, but yet inducing an appearance of greater dimensions to the court than those which actually exist. After the death of Rameses III.—with whom, it will be remembered, the 20th Dynasty opened—the prosperity of Egypt rapidly declined, and at the close of the Dynasty in 1100 B.C., the state of the country was not much better than it had been when the shepherd kings (Hyksos) were in possession. The natural result followed, and all building of importance ceased, the art of architecture only reviving with the later prosperity under the Ptolemies, even though there was

Colossi at Entrance to the Temple at Abu Simbel.

comparative peace during the 26th Dynasty, from B.C. 666 to B.C. 528. It was with the conquest of Egypt by Alexander the Great, in B.C. 332, and with the accession of his general Ptolemy, that building really recommenced, and, strange to say, upon almost precisely the same lines as a thousand years before. Throughout the length of Egypt the old temples were restored and new ones built in a style which imitated and almost equalled that of the Theban period. Everything upon the island of Philæ belongs to this time, the worship of Isis commencing there in 286 B.C. and the worship of Osiris being continued till 453 A.D., and the greatest of the other erections were the temples at Denderah, 200 B.C., Edfou 237 B.C. to 57 B.C., and Kom-Ombo. Even a casual glance at the plan of Denderah shows how similar it is to the temples of the 19th Dynasty. There is the inner sanctuary, then the pillared hall, and then the open court, with its pylon entrance, all arranged about an axial passage. The differences are those of proportion and detail rather than of general effect. There is a certain loss of massiveness and dignity, compensated by greater elegance, especially in the small single-cell temples, such as that commonly known as Pharaoh's Bed upon the island of Philæ—a delicate little gem. Like much of the work of this period, it depends largely for its effect upon its carving, for the ornamentation which a thousand years previously had been painted upon the buildings was now carved, and it was in the capitals of the columns that the change was most marked. The bud form has by this time gone out of use, but the bell is enriched with foliage lavishly applied. As a rule, fern and other leaves are represented rising above the binding straws, still present as binding together the reeds of which the column was supposed to be built up. Often

they assume most graceful forms, and the Corinthian capital of the Greeks is frequently found closely followed in general scheme. A strange point to be noticed is the retention of the axial arrangement even in these ornamental capitals, those nearest to the axis on either side being alike, and no others, or, in flanking colonnades, the first on the right of the axis being similar to the first on the left, the second to the second, and so on. Another form of capital which was now in common use was square, with the mask of a female head carved upon each face, while the abaci above the capitals were also carved in representation of small pylons. The columns, too, no longer rest upon circular discs as bases, but upon a continuous step or stylobate, and, more than this, they are joined to one another, save at main axial openings, by a dwarf wall reaching up to about one-third of their height. This wall has a small cavetto cornice, like these to the main colonnades, the doorways, and the pylons, frequently ornamented with simple, vertically-rising leaves. These comparatively slight differences are all that distinguish Ptolemaic from Theban work, yet they are sufficient to enable a judgment to be pronounced at once as to which period any particular building belongs. Thus it will be seen that there are four great Egyptian building periods, with gaps of time between, the styles of the first and second being distinct, and of the third and fourth almost identical, in spite of an interval of nearly a thousand years between them.

EXPANDED METAL IN ITS RELATION TO FIREPROOF CONSTRUCTION.*

WHEN accepting the invitation to address this Society, I was not only conscious of the honour it conferred upon me, but also of the great responsibility its acceptance imposed, especially as the subject proposed is one capable of elaborate technical treatment. But as your members do not require a technological treatise on the physical elements of building materials, this paper will so far as possible be kept within the limitation of an explanation of the character and the means of using expanded metal for floors, partitions, ceilings, &c., in combination with other well-known materials employed in the construction of buildings. The structural novelty of expanded metal has never failed to attract and interest all those who have seen it. It is metal distributed in that latticed form which never goes out of fashion, and it can be applied to almost every purpose for open metal-work as at present used. It is about nine years since expanded metal was first produced in commercial quantities, and then with considerable difficulty, as a machine had only recently been invented which would operate on the metal so as to simultaneously cut and open it. The perfecting of the details of this machine had still to be invented, and the knowledge of suitable metals for cutting and expanding had to be acquired. It was then an entirely new article, manufactured by a method necessarily peculiar to itself, and with an untried field for its employment. It is not surprising, therefore, that considerable money and energy were misdirected in the endeavour to vitalise it. There was, however, a serious limitation to the use of the products from this machine, owing to the fact that they could not be expanded from plates above $\frac{1}{16}$in. in thickness, so that on account of this, and the imperfections of manufacture, the use of the metal was restricted almost wholly to lathing for plastering. The necessity for heavier metals, and for greater accuracy in cutting, was, therefore, ever apparent, and the result was the addition of another member to the family of expanded metal inventions in the form of a machine which operates alike upon the thinnest or thickest metals required, and with great precision, as will be observed from the various specimens of metal upon exhibition here. Before detailing some of the uses to which expanded metal can be applied, it will be perhaps best to draw some comparisons between the methods and manufactures of the old expanded metal and the new, which will assist in making clear the reason why the old metal was not more generally applied for exposed uses. The old metal was limited to thin sheets because the construction of the machine necessitated peculiar cutters which would not stand the strain required for heavy metals. The new machine is the embodiment of simplicity and strength in all its parts, and is only a large shearing machine having one lower stationary blade of required length (say 8ft.) and a top blade, or series of blades, with corrugation representing half the sizes and forms of the meshes longitudinally, also means for feeding the metal forward to the cutters, and shifting it sideways between every stroke. The old machines each produced but one size of mesh or width of strand, and were limited in practice to sheets of, say, 4ft. in width. The new machines are individually capable of producing any size mesh by simply changing the upper corrugated cutters, and the width of the strands may be increased or diminished while the machine is in action. The old machine slit and opened the metal, giving much the same effect as if it was first slit and afterwards drawn open, which naturally caused the metal to shorten in length as it was opened, or expanded in width, this shortening being about 10 per cent. The new machine produces the expansion by stretching the strands as they are cut away from the plate, and consequently the finished article is of the same length as the original strip of metal, while it is increased from twice to twelve or even more times in width—that is to say, a sheet of steel 8ft. long by 6in. wide can become a sheet of expanded metal 8ft. long by 6ft. wide or more. In the old machine, motion was given to both the upper and lower cutters, both sets consisting of single cutters stacked alongside each other to the full length of the machine, and in this double movement the cutters had an almost uncontrollable action upon the metal, with the effect of distorting the produce, both in respect to the shape of the strands and of the finished sheet. The effect of the new machines is perfect alignment of cutting as to strands, and perfect squareness and regularity of the finished sheet throughout. There are therefore, besides, the almost limitless capabilities of the new machines as to varieties of products, great economy over the old, both as to the cost of construction and operating charges, and as to the quantity of metal plate required to extend over a given area. The patented processes and machines leading up to the present perfected system of manufacture are unique innovations from the routine of mechanical discoveries, and have been surprises even to engineers engaged in avocations most nearly associated in kind; so that I would ask you to pardon me if I feel some pride in the fact that there is sufficient similarity between all features of these various developments to establish them as my own offspring. Until quite recent years the classes of buildings wherein expanded metal is now largely employed were provided with floors of wood joists, and wood stud partitions, and wood lathing. This was dictated by the very obvious reason that the laths are but faggots with only an under surface of plaster to protect them from fire, and are left free above to communicate flames one to another, thus forming a fire trail to both sides of the wood joists supporting the floors and ceilings. The marked change towards the further elimination of woodwork from buildings and the substitution of all iron columns, girders, joists, &c., is shown by the fact that more than 75 per cent. of the expanded metal lathing used prior to, say, five years ago was for application to wooden joists, studs, &c., the balance of per cent. being in combination with other ironwork about the buildings, whereas at the present date these figures are reversed in nearly equal proportions. The expanded metal lathing now not only serves to incase the main girders and columns, but also to form suspended ceilings under what were once termed fireproof floors, consisting of rolled girders with concrete fillings between them, also for forming double or solid partition walls. The importance of protecting exposed ironwork from the direct contact of flames has become so apparent that new structures without these provisions are rarely to be met with. In fact, there is a general disposition to cover these in the older buildings, and the stimulance to this is noticeable immediately following the recurrence of great fires, such as the Cripplegate conflagration. The advantages possessed by expanded metal lathing, rendering it so largely useful as a building material in combination with plasters, are, that it is fire-resisting, manufactured in form convenient and economical for application, being in flat sheets, and requiring no stretching, has the maximum uniform key, and is buried within the plaster. The first proposition—i.e., fire-resisting—needs no sustaining; but the question is asked, Will it not expand under considerable heat to disturb the plaster? This has been answered in the negative by many tests, and the reason is that the sheet-steel from which it is made no longer presents the same rigid plane for expansion or buckling, but that it has been slit into numerous strands of small section, and these reticulated in such a manner as to permit each of such strands to expand, thus reducing its effect to an infinitesimal quantity, and this is compensated for by the yielding nature of the plaster. The first form of sheet-metal lathing with which I became familiar consisted of corrugated and perforated sheet-iron; sheets of such lathing, when used externally on buildings exposed to intense sun heat, continue to expand and contract, and it has been found impossible to keep them covered with cement mortar. Instances like these prove that for metal purposes the less there is of the original sheet left in its flat and corrugated form the better. The second proposition asserts its convenience in form for application, and this will be understood when it is known that it can be produced in flat sheets up to 8ft. in length, and in width of from a few inches to several feet—in fact, wide enough to incase the largest girder or column if desired. In one direction the material is sufficiently rigid to span a considerable space without other support, and yet sufficiently yielding to form self-supporting corners, &c.; while in the other direction it is readily bent, and retains itself at any desired angle. The third proposition asserts superior keying qualities for plaster. The strands forming the meshes lie at an angle of nearly 45° to the plane of the sheet of lathing, so that if the plaster only filled the sheet equal to its thickness it could not be removed except at the angle of the strands without it was first broken up. The key, however, in practice will be seen to pass through the meshes and overlap the strands, effectually burying the lathing in the mortar, and thus preserving it from exposure and oxidation.

PARTITION WALLS.

The second development of expanded metal in structural work was the formation of solid partition walls, and the present system of erecting them was due to two suggestions. One to an inquiry as to the use of the metal without supports while imposing the plaster; and the other a criticism on the use of angle-iron studs to carry the lathing. The first inquiry was in the interest of economy, while the criticism was that the angle-irons, being of stiff section, must underheat, expand and distort or destroy the partition. As a result, we have a near approach to meeting to both these suggestions—viz., the taut wire studs into which the lathing is interlaced and covered with plaster to a thickness of 1½in. or 2in. These are economical both as to first cost and in saving of floor space, and are as fireproof as the nature of the cement plaster permits. The item of saving of space is of very considerable importance in large cities, especially in sub-dividing offices, in forming stair and lift shaft casings. This invention germinated in England, and was taken up with great avidity in the United States, and is employed in many of the largest modern buildings, the area of such partitions erected annually probably extending a million super yards. They may be built within any existing building, and at any point without other foundation than the flooring as they are comparatively light, and when set hard become a monolithic slab equally distributing their weight. The advantages of this feature over segmentary constructions will be readily understood. They are surprisingly sound-proof, as has been witnessed by many tests at London.

FLOORS.

The third development of the use of the expanded metal in fireproof building construction relates to its use as a tensile bond in concrete floors. This was also a very natural adaptation of the metal, because of its manifest and surprising supporting strength. The stiffness is due to the fact that the strands are set edgewise to the plane of the sheet of expanded metal, their combined width representing the width of the original sheet from which it is made. Thus a a sheet of expanded metal of 3in. mesh and $\frac{1}{4}$in. wide strands represents a strip of steel 6in. wide set upon edge. The carrying capacity of the 3ft. width of expanded metal, it is true, is not so great as the 6in. width uncut would be standing edgewise, for the reason that in the expanded form the strands do not set vertically, but as in the lathing, approaching 45° from the plane of the sheet.

* Read before the Civil and Mechanical Engineers' Society, Feb. 17, by Mr. J. F. Golding.

But as these are supported in their lattice-like position one by the other, their carrying power is many times that of the original sheet when laid flatwise and tried as a beam. This metal, of varying meshes and weights, is used for the manufacturing of flooring, paving, slabs, lintels, &c., but most commonly for the making of concrete floors *in situ*. This is done by laying the expanded metal loosely upon the ordinary centring, so that it will reach from girder to girder or wall to wall as the case may be, and imposing the concrete upon it. It is not possible in practice to either have the centring on the expanded metal so exactly flat, but that with the weight of the workmen treading upon the sheet in the act of imposing the concrete will cause it first to slightly rise up at some point, thus permitting the concrete to pass under the metal, and which prevents it again from returning to the centring, and as they tread again at the other points, the metal will be found to have taken its place wholly within the concrete, so that when the centring is removed, the metal is not visible, but is in the best position as a tensile member and bond to the concrete. No. 8 expanded metal, which is 3in. mesh, $\frac{1}{4}$ by $\frac{1}{3}$ strands, made up into a slab of concrete 6ft. 8in. long by 2in. wide by 3in. thick, has been proved to increase the strength of the slab more than tenfold, as is stated in Messrs. Fowler and Baker's report. All the tests made by this eminent firm of engineers gave this as about the average result. The utility of this metal in concrete as against rods placed at right angles, as is done in the Monier system, is evident when we take into consideration the fact that the expanded metal is a continuous solid connected web work within the concrete, and that weight imposed at any one part distributes the strain over a larger area than it is possible for disjointed rods to convey. And besides, a large sheet of expanded metal, say a square of 8ft., is laid in a few seconds, whereas considerable care is required in placing rods of a given distance apart in either direction, and especially so if they require to be tied at the intersections. There are several systems of concrete flooring to which expanded metal has been adapted—viz.:—(1) A continuous slab lying above girder or wall supports. (2) The metal placed between rolled iron joists and resting upon their lower flanges. This latter practice may be done *in situ*, or by casting the slab and placing them between the joints as they are laid. If cast *in situ*, a strip of the lathing mesh somewhat wider than the joists may be laid beneath and longitudinally with them, so that the concrete passes through the larger mesh with it, thus providing a surface to receive plaster beneath the joists when the centring is removed. It has been extensively used in concrete arches—in some cases, the metal lying immediately upon the arched form of centring; and in other cases, as at Kennet Wharf, London, E.C., the arched centring was filled with concrete to slightly above the crown of the arch, when the expanded metal was laid flat from girder to girder, and the filling in of concrete continued. By another system considerable length of span between supports is obtained. As before stated, there is no single system of floor which seems to lend itself to all requirements, and this particular floor, generally described as the channel arch system, has proven to be most economical where spanning of considerable distance is necessary. Its special advantages are that it produces an exceedingly rigid floor with a minimum amount of material, and its consequent lightness. This flooring may finish up either with or without a suspended flat ceiling, or with a dome ceiling, as shown in Plate 9. There is no limitation upon the span of flooring or roofing to be obtained by this system within the average requirements for buildings. One of the first works carried out on this plan was a reservoir roof, having a clear span of 60ft. In this instance the arches were about 8ft. deep at walls and the apex of the roof some 6ft. above the walls, giving a rise of about 14ft. The channel supports were 7ft. apart, and the thickness of the concrete between channel supports, including the finish, about 3in. These floors, of 12ft. spans, the channels at 4ft. centres, with 12in. rise, with 3in. thickness of the flat concrete, had been loaded with 17cwt. per super. foot, and variously otherwise tested until their strength and utility has been fully established. I have to thank you for your very kind attention to this subject, and trust, if I have not succeeded in conveying anything specially new, still, that I may hope to have awakened such interest in the matter as will enable those of you of inventive turn of mind to improve upon the methods of using expanded metal to your great advantage, as well as to my own.

LAST SUMMER IN BRITTANY.

HOWEVER enjoyable the thorough change of a long sea-voyage may be to the typical business man, the average one cannot find complete happiness in utter laziness, and so it seems to me this is a capital time to jog down collectively a few odds and ends. They are notes written on the spot—last July and August—during a happy holiday in Brittany and Finisterre, when the same ground was travelled that I had previously gone over fully a quarter of a century before. The entries that follow are given just as they come in my pocket-book, and may be taken for exactly what they are worth.

ST. MALO.

Seen from any point of view, this most picturesque old place looks as quaint as ever. Surrounded entirely by its Mediæval walls (so broad in places that two carriages can be driven abreast upon them), these ramparts represent a preambulation of exactly half an hour if the visitor cares to walk around the top of them. Scarcely a new house has been erected within these sturdy walls for something like 300 years; so, needless to say, no builders live there, and there are—no strikes! Practically, the whole place is built of grey granite, the streets are very narrow, and the houses are exceedingly high. A great improvement has taken place in all sanitary arrangements since my last visit. Then it was quite customary to throw "slops" of all kinds out of the windows, making the thoroughfares, in that respect, more dangerous than some of us can remember old Canongate, in Edinburgh, to have been. Happily, all this has been changed for the better; water has been laid on to every house, and the ordinary requirements of civilisation are now the rule, and not the exception. The internal old woodwork of many of the houses is most interesting. For instance, I slept for a week or so in a panelled chamber, to which access was only gained by mounting steep winding stairs, with solid wood risers, built like those in a bell turret. There are massive beams in the room supporting the ceiling, in the centre of each of which were bold bosses, carved in the solid. St. Malo, although quite a small place, contrives to support no less than four master woodcarvers, who appear to at once do excellent work, and to obtain a comfortable living.

Founded upon a rock, the place is practically an island, so, like New York city, it cannot grow any bigger in its actual state; but during late years its environs have increased wonderfully. Dinard, on the opposite side of the water, now claims to be a thoroughly ideal modern French watering-place; but St. Servan, which one supposes is a kind of mainland to St. Malo, keeps as dull as ever. One of the connections between these two places is a most remarkable moving bridge, known as "Le pont Routant." The tide at St. Malo, as is generally known, falls and rises very rapidly, something like 40ft. The bridge (if it may so be called) takes the form of a tramcar, supported up to the level of the road from the bed of the river by a tall, slim framework of iron, which, worked from the bottom, steadily traverses the distance from shore to shore, no matter how high or low the tide may be. When the latter is down this lift-like working-car moves along quite two score feet in the air, and has a most peculiar appearance.

The most charming feature about St. Malo is undoubtedly the splendid bay, with its broad sands extending around the coast to Parame, itself a pretty bathing-place, about two miles away. A new spire has just been added to the church at Parame, and at the time of our visit, although completed, was still surrounded by a network of scaffolding. A steam-tram, running at frequent intervals, unites the two places, whilst a light railway connection goes on from Parame to Rothéneuf, another little coast village smuggled in another bay a few miles further east. Here a number of pleasantly-situated villas have quite recently been erected upon various advantageous points overlooking the sea. It was regrettable, however, to notice that here, as at so many other places in North-western France, the tall, venerable, old village cross, consisting of an octagonal oak shaft upon a granite base, has its upper part, above the crucified Christ, falling to pieces. This interesting 17th-century cross is apparently quite uncared for and neglected. At Rothéneuf a grand hotel has lately been built opposite the sea; at present it looks very much too large for visitors, even at the very height of the season. The desolation in winter must be such as may be felt.

On the shore, all around the bay between St. Malo and Parame, detached villas, many of them handsome mansions, have sprang up within the last few years, and form a continuous connection between the two places. There is also a very large and pretentious new casino. Substantially erected, these villas are distinctly un-English in appearance. The same kind of dwelling-house one will find to-day being erected by the score outside Amsterdam and in the suburbs of Chicago. So, nowadays, to those who know both sides of the Atlantic, it is difficult to feel sure whether the styles for detached and other residences most affected should more correctly be defined Continental or American; certainly, for artistic, well-composed, and conceived mansions the new school of American architects are in noway behind their average European confrères.

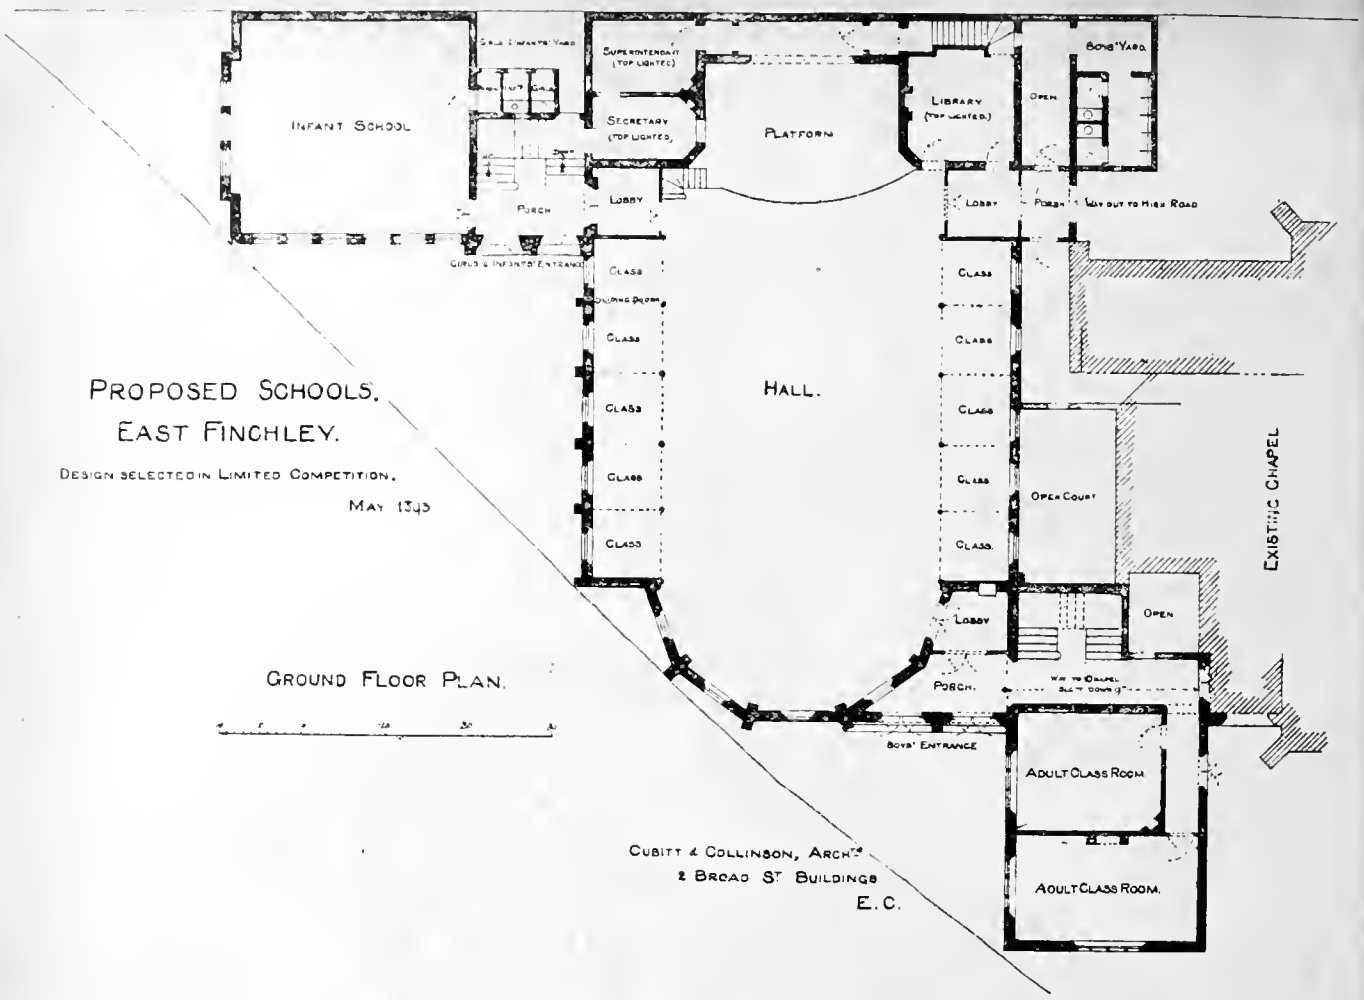
DINAN.

The Rance is a pretty river, as much like, in size and sylvan beauty, the Dart or Tamar in Devon as well could be. The steamer ride from St. Malo to Formosa (the waterside village at the foot of the hill Dinan is built upon) is lovely. Dinan itself is perched on the summit of a steep, scarped rock, high above the Rance, and the deep gorge through which the latter flows is spanned by a high Roman aqueduct-looking bridge of ten or a dozen arches. The torturous, steep, old street, known as the Rue du Jerzual, that connects Dinan with Formosa, is one continuation of ancient half-timbered houses, all and everyone of exceptionable architectural interest, but all in an awfully tumble-down state. The ancient fortifications are almost intact; some parts of them date from early in the 14th century. Near the cathedral it is deplorable to see quite a row of old curiosity and second-hand shops, filled to overflow with Mediæval Calvaries, old Breton bedsteads, carved statues, and other interesting examples of ancient woodwork, evidently ruthlessly torn (and recently) away from their original positions. The same lamentable exhibitions of deliberate vandalism may be seen, perhaps in a rather lesser degree, at Morlaix, Brest, and other places in the north-west of France.

BREST.

Brest is about so far west of Paris (387 miles) as Edinburgh is north of London; but the train services of the two countries will bear no comparison. In London the would-be traveller may take his pick of half a dozen third-class trains daily, doing the distance in from $6\frac{3}{4}$ to $8\frac{1}{2}$ hours; but, between Brest and Paris, there is only one through train daily (first and second class only), and it takes 14 hours or thereabouts in the journey. Brest is about the size of Plymouth, but the latter cannot compare with it in position. Brest harbour has the goodly reputation of being one of the three finest in the world. It is almost landlocked, its only connection with the Atlantic being by a narrow entrance called Le Goulet. Brest itself stands upon elevated land overlooking this fine inland sea, the latter bordered around by pretty and varied coast scenery. Its two admitted rivals are the bays of Sydney and Rio de Janeiro respectively. The far-famed lovely stretch of waters just inside Sydney Heads our Colonial cousins are most justly proud of, but it admittedly lacks the sublime grandeur of the towering mountains which enrich the bay at Rio. The bold, precipitous headlands which guard the entrance to Sydney, are, we know, strikingly majestic; they pale, however, before the stately sugar-loaf, which stands like a giant sentinel over the portals of the "Bay of Hidden Waters" (as the Indians were wont to call it). Brest itself is distinctly a "bay of hidden waters," and there are more things hidden there than one, for it and its harbour are undermined, it is said, for defensive purposes in every direction.

The main thoroughfare in Brest is Rue de Siam, a long, straight, somewhat narrow street, with even narrower sidewalks. Just on entering Brest by rail on the southern side of the line is a cleverly-designed house; it is of considerable size, and its graceful turrets rear up very happily above the tall trees amongst which it is built. This is the Château Ker Stear, erected about 12 years ago from the designs of M. Chabal, archi-



tect, of Brest. If this is this gentleman's usual style of work, then the mantle of the late Viollet le Duc rests worthily upon his shoulders. Little actual building is apparently going on in Brest. At the bottom of the Rue de Siam a large site has been made by the clearance of tumble-down, inferior buildings. It all consists of municipal property, but nothing has yet been decided as to its ultimate use. Some old buildings have also been demolished in another part of the city, and this will admit of the continuation of the Rue Admiral Linois into the Rue de St. Yoes. Once finished, it will open up a new street, parallel to the Rue de Siam from the Boulevard Thiers, and must give much needed relief to the traffic at the southern end of Rue de Siam, a thoroughfare whose unfortunate contracted width has already been touched upon. A large new building, by no means ornamental, has lately been erected on the Place du Château, a fine open space in front of the interesting old 13th-century castle. It is intended as barracks, &c., for the staff of the engineer corps.

Brest, although nominally the terminus of the Western Railway of France, has two light lines running out from its station, both built three or four years ago. One of these is the departmental line which joins Brest with St. Renan and Ploudalmezeau, a distance of 32 kilomètres (20 miles), and the other to Lannilis, 30 kilomètres (19 miles). The latter section branches off at Rufa junction, which is a mile or two out of Brest. Further, at the time of our visit (last August), labourers had already commenced to cut up the main streets, and electric cars, on the trolley system, will soon be, if not already, running in Brest. When this comes about the old fortification, and the old inhabitants, will, indeed, be astonished at such an unusual spirit of innovation in their midst. The shady walks upon the ramparts are simply delightful. The Rue de Cours Dajot, 1,600 mètres (about one mile) long, is a superb promenade, giving a fine view of the roadstead. At one end is a marble statue of Neptune, and at the other (the western) of L'Abondance. They are both the work of that great sculptor, Coysevot, and, after having been vilely mutilated during an insurrection at some time or other, were conservatively restored five or six years ago. They each bear the following inscription:—"Donné à la Commune de Brest par le Gouvernement Consulaire le XIII. Germinal, an IX."

The cemetery at Brest is on high ground outside the town; it is well filled, many of the memorials being exceedingly good. This God's-acre is shady, and has sweet-smelling flowers growing everywhere. A painful interest centres in the monument over the bodies of the Brothers Whipp, who went down with the *Drummond Castle*. The memorial consists of a tall cross and body stone of polished black granite, with an inscription running—

In loving memory of Frederick Walker Whipp, aged 34 years, and Walter Walker Whipp, aged 30 years, youngest sons of James and Mary Whipp, of Clitheroe, England. They were drowned near Ushant by the foundering of the ss. *Drummond Castle* when returning home from South Africa, and their remains are interred here. "In death they were not divided."

The statuary who made this monument also erected those to the memory of other victims in the same catastrophe that we saw at Lockrist and St. Patri, near Lannilis, on the coast, and upon the islands of Molene and Ushant (written Ouessant, and pronounced Wis-song in French). He has extensive yards in the Rue de Paris and Rue du Cemetière, opposite to the entrance to the burial ground at Brest, and is a very jolly man of 60 odd summers. His card reads—

JULES POILLEU,
Sculpteur Marbrier,
Conseiller Municipal.

I have been a town councillor myself, and know many others who have also filled the same kind of office, but never saw "Town Councillor" printed on a business or private card before!

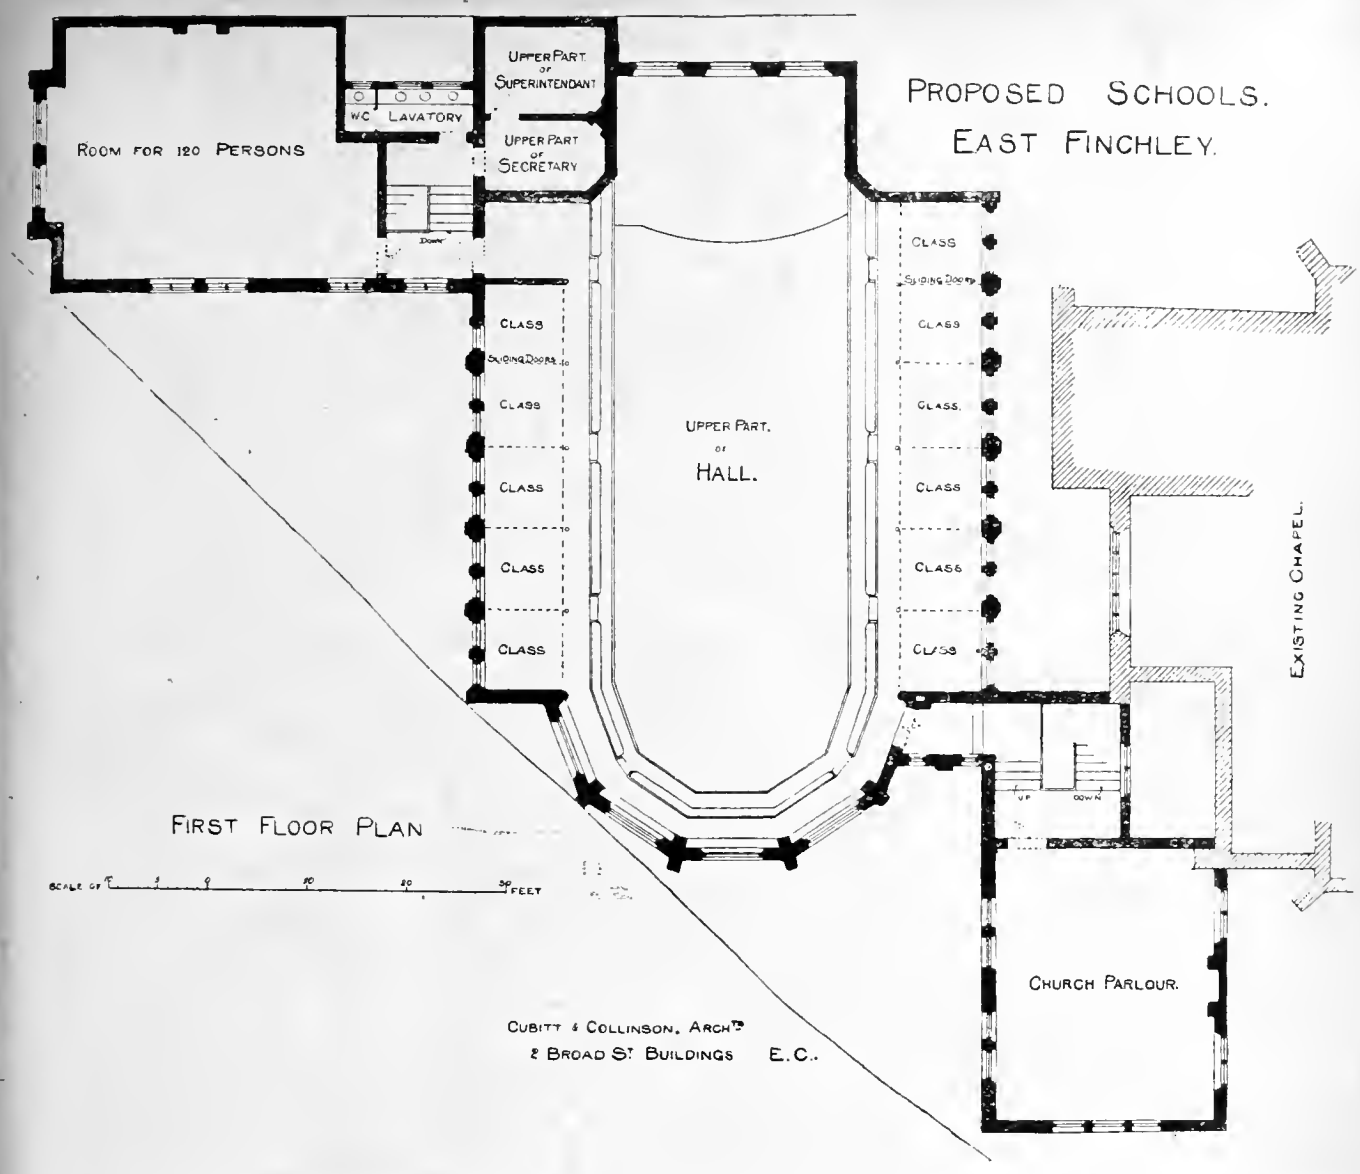
Through the courtesy of Mr. W. R. Hoare, the energetic British Consul at Brest, I am able to give the following particulars as to the wages paid in the building trade in the city where he so ably represents the interests of our countrymen. Carpenters, 3f. 50c. (2s. 11d.), wages paid monthly; granite and stonemasons, 3f. 50c. to 4f. 50c. per day (2s. 11d. to 3s. 9d.), paid weekly or fortnightly; plasterers, the same pay as masons, but received fortnightly or monthly; painters, 3f. 50c. (2s. 11d.), paid every two weeks. Plumbers are also paid every fortnight, and receive 3f. 75c. to 4f. per day (3s. 1½d. to 3s. 4d.); brieklayers, 3f. to 3f. 50c. a day, their wages paid fortnightly or monthly; labourers, 2f. to 2f. 50c. (1s. 10d. to 2s. 1d.), these receive their money every night. All the above trades work, in summer, 63 hours a week. The working hours on Saturdays are the same as other days. In winter, on an average, about 50 hours per week are worked. The pay is the same both in winter and summer. So it will be seen from the above statistics the rate of wages paid, per hour, are as follows:—

Carpenters and painters, 21 francs a week (17s. 6d.), which is a fraction over 3¼d. an hour in summer, and 4¼d. per hour in winter. Stonemasons and plasterers receive the same pay; but superior men in both avocations get as much as 27 francs a week (£1 1s. 8d.), which is just over 4d. an hour in summer, and 5¼d. in winter. Plumbers are paid from 22½ francs (18s. 9d.) a fraction over 3⅝d. an hour in summer, and 4½d. an hour in winter, up to (top wages) 24 francs (19s. 2d.), hardly 3¾d. an hour in summer, and just under 4¾d. per hour in winter.

Bricklayers' wages are, curiously, lower than any other trades connected with building. They get 18fr. (15s.) a week, which works out at between 2¾d. and 3d. per hour in summer, and halfway between 3½d. and 3¾d. in winter. Labourers have 12fr. (10s.), which is less than 2d. an hour in summer, and just under 2½d. in winter, whilst "dapper" men amongst them get 15fr. (12s. 6d.), which is a little over 2¼d. an hour in summer, and in winter 3d. an hour.

It is very distressing to find the ancient wayside Calvaries in Brittany so fast disappearing. Hundreds of them have gone since my last visit. I happily rescued from a mason's yard into which they had been ruthlessly thrown, a couple of colossal ones carved in wood in excellent preservation and painted (each, probably, 250 years old). They stood, originally, near le Conquet, the Land's End of France. I got them both carefully conveyed home, and one of them now stands on a cross 40ft. high, on the lawn of my own residence at Exeter.

And now I must close. The R.M.S. *Avondale Castle*, after a capital run of little over four days from Southampton, has just arrived in the midst of the deep-blue bay at Grand Canary. As I look out of the port window at my elbow, Las



Palmas, with its tall date-trees, its vast orange groves, and its Eastern-looking flat-roofed houses, spoilt somewhat in their grouping perhaps by the ugly towers of the cathedral, stands prettily near the golden sands, backed by a clear azure sky, and lit by the glow of most glorious sunshine.

Steamers coal here, and as that makes a delay of eight hours or so, passengers to South Africa are only too glad to take advantage of the stoppage to stretch their legs a while on shore. So, following their example, I will also renew pleasant memories of a prior visit to this "beautiful isle of the sea."

Our next port is Cape Town, where we are due in 17 days' time.

February 3. HARRY HEMS.

EAST FINCHLEY CONGREGATIONAL HALL AND SCHOOLS.

WE have no intention of reviewing the correspondence* which appeared in our pages between Mr. James Cubitt, the architect of the plan which was selected in this competition, and Messrs. Spalding and Cross, the architects who carried out the work. With the relations between the committee of the chapel at East Finchley and their architects we have not the smallest concern, and we take no sides whatever in the dispute between the several parties. An offer, which seemed a fair one to all concerned, was made by us to publish Mr. Cubitt's plans by the side of those of the building as executed under the supervision of Messrs. Spalding and Cross, so that readers might form their own opinions as to the accuracy of the statements made on either side.

As Messrs. Spalding and Cross told us in their letter published on Dec. 24th that the drawings were unfortunately not in their possession, we asked the committee if, with the consent of their architects, they could either lend the drawings, or, failing that, allow a plan to be made from the building. No definite answer was vouchsafed for some time, hence the delay; but on a second application our request was declined. We were told that the authorities of the church would afford us no facilities to survey the buildings, and that, as far as the secretary's information went, the plans were now in the possession of Messrs. Spalding and Cross. We consequently wrote to these gentlemen, offering to print their plans side by side with Mr. Cubitt's without comment, and thus let the drawings speak for themselves. To this Messrs. Spalding and Cross, acting under the advice of their solicitors, Messrs. Wontner and Sons, replied last week, saying that they are unable to comply with our request.

Mr. Cubitt has sent us his original plans, requesting us to publish them, and we print them, therefore, herewith. Those sufficiently interested in the controversy can now compare them with the building as actually erected.

* See BUILDING NEWS, Dec. 17, 24, and 31, 1897; and Jan. 14 and 21, 1898.

LEGAL LIABILITY FOR PROFESSIONAL OPINION.

UNDER the above title an interesting paper was read at the ordinary general meeting of the Surveyors' Institution on Monday evening last by Mr. T. W. Wheeler, Q.C., who dealt with the subject, first, as regarding professional or expert opinion as the law views it; next, as to the degree of skill which the law considers necessary to the practice of any particular profession or calling; and, lastly, as to the damages which may be given in cases of professional negligence. The author was not quite sure when the reception of "opinion" as evidence was first established. Matters of fact, and not matters of opinion, were regarded as evidence. The jury, and not the witnesses, had to form an opinion; but where there are questions of matters of science or art, the opinions of persons skilled in such matters were relevant facts, and this applied to all subjects on which a special study or experience was necessary to the formation of an opinion, and within this rule medical men, engineers, surveyors, artists, scientists, and experts in handwriting were among those included. It was clear that, from the time when roads and canals were the subject of litigation, there was some admission of expert evidence as to the amount of damage to adjoining owners. Lord Mansfield, in 1766, rejected expert evidence as mere opinion, but in 1782, admitted it in a case of pure science, in which Smeaton was the expert witness. The questions put to an expert must be questions of art or knowledge, and the real use of such evidence was to open the eyes of the jury to points which otherwise might not be observed by unskilled persons. In some foreign countries—France and Germany, for instance—the experts were called, not as witnesses on one side or the other, but only as advisers of the Court; and the evil of the present system in America, which was similar to our own, had grown to such proportions that the adoption of the French system had seriously been considered. In the case of a surveyor's evidence as expert witness on one side or the other, it was his duty to see that no possible interest of his client, however remote, was overlooked. The surveyor, on the other side, must exclude as far as possible those elements of value which were problematical or visionary, and thus wide divergences of opinion arose. The "bias" of a witness could only be tested by cross-examination, and the effect of the evidence on an ordinary jury must be considered. But the author thought the "bias" of experts was a vanishing quantity. In a recent case—"Haigh *v.* L.N.W.R."—it was laid down that the award

of an arbitrator under the Lands Clauses Act was not necessarily biassed because during the pendency of the award he had given evidence in favour of one of the parties in another inquiry, although one of the judges threw out more than a word of warning that an umpire in such a case should inform the parties as to the facts. There had been many ignorant or half-informed critics who, taking particular cases, had made out a case against professional umpires as having some rough-and-ready method by which, in spite of evidence, they settled matters brought before them; but the fact that surveyors as a profession were so thoroughly trusted in matters of valuation was a sufficient answer to this criticism. The duty of a surveyor, whose report formed a kind of rampart behind which a trustee could find safety and security, was a delicate and even a dangerous one, and, in case of mistake—negligent mistake, of course—involved a heavy liability. In the case of counsel or physicians, whose fee was an "honorarium" and not recoverable, it was probable that liability was only incurred to the extent to which one was liable who renders a gratuitous service, although, as the author pointed out later on, even in that case a man was bound to exercise ordinary care and skill. "A man who enters upon the exercise of a public profession contracts," said Mr. Wheeler, "to bring to bear upon his function, whatever it may be, honesty and integrity, of course, and, further, there is an implied warranty that he is skilled and reasonably competent for the task he undertakes." No one undertook more than this by the mere fact of employment. He could not be bound to possess an unclouded judgment or consummate skill; but, in the words of the lawyers, "readiness and willingness" to discharge his duties imported capacity to discharge them efficiently. Mr. Wheeler proceeded to give several cases in which "negligence" had been charged, mainly for the purpose of showing that whilst in the witness-box expert evidence had been very widely criticised, often in ignorance, yet the Legislature had intrusted many important duties to experts in an advisatory and even a judicial sense, while the faith reposed in them by the public was of the widest and broadest character. So should be their responsibilities and liability for failure of duty, negligence, or ignorance.

A short discussion followed, in which Mr. Howard Martin, Mr. G. R. Crickmay, Mr. D. Watney, Mr. G. Corderoy, and Mr. Northcroft took part. In response to the latter speaker, Mr. Wheeler said that in case of liability the amount of the fees was by no means the measure of damages. In fact, it had nothing whatever to do with the matter. The vote of thanks having been carried unanimously, the meeting then adjourned.

SPECIFICATIONS IN DETAIL.*

THERE are few treatises on specifications, and these are so incomplete or so superficial in their character as to be of little practical use to architects. In a new work under the above title, Mr. Frank W. Macey, architect, attempts to supply the want. As to whether he has satisfactorily done so, only those who have carefully examined the contents of this comprehensive volume can express an opinion, for a work of this kind can only be tested by many practical applications. As far as we have been able to examine the contents of the work and the system on which it has been compiled, we believe it will be found very helpful by a large number of young architects who have not yet been able to prepare a workable and complete specification, or who are in some doubt as to the best system and the proper wording of clauses. One valuable feature of Mr. Macey's work is the large number of diagrams, marginal sketches, and details which illustrate every page of the work, and which assist to make it a handbook of workmanship and details as well as of specification clauses. We find the clauses, as a rule, are sufficient. The author explains many of them by footnotes or paragraphs close to the clause itself, which is very necessary in many special cases. The clauses describe the usual methods employed, and the sizes and dimensions are those for a superior class of work; but smaller sizes and thicknesses are often given in brackets for less substantial work. Of course, every architect ought to be able to use his own judgment in filling in the proper scantlings and thicknesses. To examine a few of the trades. Taking the Bricklayer, we find the first clause devoted to hollow walls. The author specifies a 2½in. cavity, and he is quite justified in saying all external walls should be built so. In brick districts in the South and West of England the cavity is usually 2½in. The author specifies "heavy galvanised cast-iron wall ties about 8½in. by 2½in. by ⅜in.," with a dip in centre and forked ends spaced 3ft. apart alternately to every third course of brickwork. Perforated air bricks are to be placed under the eaves-course, and similar air bricks at the base of wall for ventilating the cavities. Over the door and window frames 4lb. lead is to be placed in the cavity, forming a gutter, turned down at each end, so that the frames may be protected from any water that may find its way in. In a note the author says, "It is better to make the outer casing the lesser thickness, so that the inner casing may be of sufficient strength and thickness for bedding the joists and roof-timbers upon." A 9in. wall would have both inner and outer casings half-brick thick; in a 14in. wall there would be a 4½ brick outer casing, and a 9in. inner casing. For many reasons we prefer the thicker casing to be on the outside, especially for buildings in which deep brick reveals and jambs are essential, and if the wall thicknesses are properly tied together (we prefer wrought-iron or galvanised ties, well forked at the ends), the inner half-brick casing is ample for carrying the weight of the two floors. Of course, for buildings of several stories, and carrying heavy floors, at least a one-brick wall is required. Mr. Macey says, in a hollow stone wall where the greater thickness is necessarily outside of cavity, the joists, &c., must go through the cavity and bear on the solid stone outer wall. This is certainly not desirable, as the timber in the cavity would soon decay; nor is it necessary if the half-brick inner casing is well built and tied to the outer walls.

About bricks, much useful information is given. It will not be generally accepted that "kiln-burnt are better than clamp-burnt bricks." Nor will the architect be disposed to act up to the suggestion that "rubbers" are soft bricks, and do not stand the weather so well as bricks moulded and carved before burning. The different qualities of lime are noticed, and a clause is given for each. One clause runs: "The lime to be freshly-burnt hard grey chalk (stone) lime from Halling, Dorking, or Maidstone"; another, "The lime to be freshly-burnt blue lias lime from Barrow, Rugby, or Whitby." The latter is, of course, more hydraulic, but expensive. For damp situations the lime from Halkin Mountain or Aberthaw is recommended as the best and the most powerfully hydraulic. Clauses are given for selenitic lime or cement, lime mortar, gauged lime mortar, hair mortar, blue or black mortar, cement mortar, putty. Much useful information is given in this trade as to the requirements of the London Building Act, and the schedules of thicknesses for the three classes of buildings are quoted, so that no reference need be made to the Act itself. Various kinds of sleeper walls for joists and paving are mentioned, with sketches of parapets, eaves, circular work, pipe channels, inverts, vaults, dry areas, flue-pipes, chimney stacks, ventilating flues, arches, &c. Many special kinds of walling, retaining walls, and storage reservoirs are usefully introduced, but the clauses for terracotta and faïence are inadequate. The carpenter, joiner, and ironmonger occupy by far the larger portion of the book, and we have many detail suggestions for such things as floors, fire and sound-proof timber floors, flooring of particular kinds (rebated or fillistered), grooved and tongued yellow Gefle deal in batten widths, with several alternative clauses for them. A model clause for reception-room double flooring is useful, in which 1in. wrought (or rough with edges shot) is laid on joists, and yellow Gefle deal counter-flooring in batten widths, laid folding, to be rebated, grooved, and tongued, of 1 or 1¼ wrought Austrian Trieste oak, or Hungarian Fiume oak, or Russian Riga oak, or Dantzic crown Memel oak, or wainscot oak or Moulmein teak, or American pitch-pine in certain widths. Then we have many alternative clauses for roofs, flats, domes, and skylights, illustrated by numerous types of roof. The clauses for many special kinds of casements, and numerous sections of sills, and frames, transomes and heads are of value. Half-timber work, so generally omitted from works on this subject, is dealt with. The Smith and Founder is prefaced by data on wrought and cast iron, and clauses on rolled iron joists, plates, bars, rivets, &c. Specifications for wrought-iron and steel joists and girders are useful; iron roofs of various spans are sketched, corrugated iron roofing, stanchions, and columns of cast iron, with their relative strengths, and section, and connections, are described. Some useful clauses on stoves and ranges will be found. The subject of heating is described, and various systems are illustrated, a branch of specification which is often very imperfectly dealt with or is intrusted to the engineer. Stables and fittings form part of this trade. Plans of stalls and cow-houses are given in addition to clauses. Under Plumber the principal sanitary fittings are described, and the clauses refer to hydraulic rams, cisterns of galvanised iron and lead, hot-water supply. The latter is illustrated by diagrams showing hot-water circulation in connection with close fire-range, high-pressure boiler and cylinder and different arrangements are shown. The mode of laying zinc flats, jointing of sheets, and other items is described. Electric lighting forms a useful addition, and the wiring of buildings is generally described, and clauses given. This is a branch which was generally left to the electrician. The information and clauses, with the aid of the diagrams, will be of value to architects, though a few of them are rather ambiguous. A form of tender is given at the end, and a very full index, which will render the volume of much value to all professional men who wish for information or precedents in writing their specifications.

* Specifications in Detail. By Frank W. Macey, Architect. London: E. and F. N. Spon, Ltd., Strand.

THE ENGINEERS' YEAR-BOOK.*

WE have received from the publishers (Messrs. Crosby Lockwood and Son, 7, Stationers' Hall-court, London), a copy of the fifth year's issue of this indispensable daily reference-book for engineers. The volume is published at the moderate price of 8s. In his preface to the current issue the author states, "besides general corrections—necessitated chiefly by the annual alterations in rules and regulations—the book has again been thoroughly revised throughout, and a large number of entirely new pages added, bringing the total up to 700 as compared with 590 in the first or 1894 issue," and using 850 engravings for the illustrations.

The work is a development on the lines of Molesworth, Trautwine, and D. K. Clark. Whilst the general contents of the book are of a high order, the range of matter included in the volume is very wide. A great point in the book is that it supplies explanations and directions, as well as formulæ and tables, and it is arranged to answer the demands of mechanical as well as civil engineers. The author is in a responsible position, and he has access to very useful and not very readily attainable information, and in his comprehensive, complete, and accurate volume has brought together with great skill all the technical professional information which an engineer has to use day by day.

* The Engineer's Year-Book of Engineering Formulæ, Rules, Tables, Data, and Memoranda for 1898. By H. R. Kempe, A.M.Inst.C.E. Fifth year of publication.

The new station for the City and South London Railway at St. Mary Woolnoth, Lombard-street, E.C., is being designed by Mr. Sidney R. J. Smith, who, as architect, is working in conjunction with Sir Benjamin Baker and Mr. David Hay, the engineers. Mr. Smith will be responsible for all the work above ground, and he is adopting a style in harmony with the church of St. Mary Woolnoth, which was designed by Nicholas Hawksmoor. The station will be under the church.

The plans for the new municipal buildings to be erected in Govan have been passed in the Dean of Guild Court. The buildings will be situated in the corner of Govan and Summerton Roads, and will include offices for burgh purposes, council chambers, a large and a small hall, and the necessary committee and other rooms. The different frontages are: To Govan-road and Carmichael-street, each 157ft. 3in., and to Summerton-road, 240ft.; to Merryland-street there will be two frontages of 71ft. and 86ft. 6in. respectively, there being a space left in the middle for future extensions. There will be a large hall capable of accommodating 2,000 persons, and a smaller hall which will seat 500 people, with the usual cloak and retiring rooms adjacent. The main entrance for officials and commissioners is from Govan-road, as also is the entrance to the board-room. The buildings will cost over £30,000. Messrs. Thomson and Sandilands, Glasgow, are the architects.

OBITUARY.

MR. WILLIAM SPOONER TILL, who for nearly forty years ably and faithfully filled the office of city surveyor of Birmingham, died on Tuesday in his 68th year. For a long time Mr. Till's health had been failing, and his retirement from the surveyorship was due to this cause. Recently he had suffered from insomnia, and had an attack of influenza a few weeks ago. Mr. Till was a native of Birmingham, and was educated at King Edward's School. He left school at the age of sixteen, and was articled to Mr. John Piggott Smith, who was surveyor to the Commissioners under the Birmingham Street Acts, a body who were in some sense the predecessors of the town council. In 1851 Mr. Piggott Smith became borough surveyor to the town council, and so continued until 1857, when he was succeeded by his assistant, Mr. Till. Mr. Piggott Smith had received £600 per annum, but Mr. Till, then twenty-seven years of age, commenced at only £300. Under its new municipal government, Birmingham began to move forward with rapid strides, and numerous works of street improvement and sewering were undertaken. In these the borough surveyor was both the adviser of the Corporation and its executive officer. The duties of his department grew until his position became that of the head of a large staff. The salary of the office, which had been increased from £500 to £600 in 1867, was raised to £700 in 1870, and to £1,000 in 1877. In the latter year also the Tame and Rea District Drainage Board came into operation, and Mr. Till received from that body the appointment of engineer to the sewerage works, which had been mainly constructed from his drawings, at a salary of £200, afterwards raised to £400. Mr. Till possessed, says the *Birmingham Post*, untiring industry and a quiet grasp of the subjects with which he was called upon to deal which made him a most efficient officer. He established so high a reputation for fairness and sound judgment that his advice was frequently sought in disputes and questions of drainage difficulty arising in connection with the suburban sanitary authorities. He saw the bounds of the city enlarged, and the appearance of its central streets wholly changed. When Mr. Till first took control of the surveyor's department, the heart of the town was little better than a network of narrow streets and gullets. Beyond New-street, High-street, and Bull-street there was not a pavement in the place but what was set with "petrified kidneys." In Hagley-road and similar thoroughfares the paths were strewn with gravel, but the stones were of a great size. Some streets were in such a state as to be positively dangerous, and in not a few streets the footpaths were raised a considerable height above the road. The paving of the footpaths, the alteration of the street lines, and the laying-out of the sewerage afforded an immense amount of work. The principal street improvements carried out under Mr. Till's superintendence were the making of Albert-street, Stephenson-street, and John Bright-street; the widening of Colmore-row; the formation of the present line of Edmund-street, between Congreve-street and Livery-street; the doing away with the level crossing in Duddeston Mill-road; and the making of Station-street and Holiday-street in connection with the London and North-Western and Midland Railway extensions. The length of public sewers constructed was over 199 miles. The formation of the drainage district, in connection with which Mr. Till also rendered services, took place in 1877. The district includes, besides Birmingham, Smethwick, Balsall Heath, Harborne, Saltley, Aston Manor, Handsworth, Aston Union (contributory place of Aston), King's Norton Union (contributory places of King's Norton and Northfield), West Bromwich Union (contributory place of Perry Barr), and the borough of Sutton Coldfield. In the construction of these works, and in the acquisition of land, Mr. Till showed himself an able engineer and a no less excellent negotiator. Mr. Till was a widower, but leaves a son—Mr. Guy Till, who is engaged in the surveyor's department of the Birmingham Corporation—and five daughters.

MR. GEORGE HENRY GRIMWOOD, J.P., head of the firm of Messrs. Grimwood and Sons, builders and contractors, of Sudbury and Ipswich, died on Monday at Brighton, after a long illness, aged 52 years. Mr. Grimwood was an alderman and justice of the peace for Sudbury, and had twice served as mayor of that borough. His firm erected the new post-office at Ipswich, and many other buildings in the Eastern Counties.

PROFESSIONAL AND TRADE SOCIETIES.

EDINBURGH ARCHITECTURAL SOCIETY.—At a meeting of this society, held in Dowell's Hall, on Wednesday, February 16th, Mr. William M. Cumming, A.R.I.B.A., president, in the chair, a paper was read by Mr. J. E. Forbes, intitled "Normandy." Mr. Forbes gave a very interesting account of his tour, and sketched the general characteristics of the towns in Normandy, especially pointing out the peculiar beauty of colour pervading the landscape. Rouen was specially mentioned as being exceptionally artistic, showing marked examples of 14th and 15th-century architecture. Passing on to Lisieux, Mr. Forbes mentioned the timber-framed houses as worthy of notice, comparing favourably with like work in Chester. The paper was profusely illustrated by limelight views.

REUNION OF ARCHITECTS AT CARDIFF.—The annual dinner of the Cardiff, South Wales, and Monmouthshire Architects' Society was held on Saturday evening at the Angel Hotel, Cardiff, when a large company of architects attended from various parts, the guests including Professor Aitchison, R.A., P.R.I.B.A., Mr. H. V. Lanchester (the successful designer in the competition for the proposed municipal buildings in Cathays Park), the Mayor of Cardiff (Alderman Ramsdale, J.P.), Canon Thompson, the Deputy-Mayor (Alderman David Jones, J.P.), Mr. Lewis Williams, J.P. (chairman of the Cardiff School Board), Councillor E. Thomas, J.P., and Mr. Lascelles Carr, J.P. The chair was occupied by the president of the society, Mr. C. B. Fowler, F.R.I.B.A. Mr. E. W. Corbett, M.S.A., gave the toast of "Our Pastors, Legislators, and Defenders." Captain W. H. Caple, of the Severn Volunteer Division of the Royal Engineers, acknowledged the toast. Canon Thompson, D.D., submitted the toast of the evening, and expressed the hope that after this lapse of three years the annual dinner would be continued in its proper course. The Chairman, in replying, dwelt upon the state of the South Wales Society, which was formed in 1890, and although the membership had decreased from 28 to 18 last year he was pleased to state that from the number of applications and the various letters of inquiry they hoped that in a short time it would be greatly increased. Professor Aitchison, R.A., also responded. Mr. Lascelles Carr submitted the toast of "The Governing Bodies." The Mayor (Alderman Ramsdale), the Deputy-Mayor (Alderman D. Jones), and Mr. Lewis Williams replied. Mr. Edwin Seward, F.R.I.B.A., submitted the toast of "The Master Builders," which was replied to by Mr. J. E. Turner (president of the Master Builders' Association), and "The Visitors" completed the list.

SANITARY INSPECTORS' ASSOCIATION. — The 15th annual dinner of this association was held at the Holborn Restaurant on Saturday evening. Sir John Hutton, the president, occupied the chair, and the company numbered about 200. The President, in proposing "Success to the Sanitary Inspectors' Association," said its 700 members included many sanitary inspectors throughout the country. In London there were only some 200 inspectors for sanitary matters, and that was a totally inadequate number, seeing that London possessed some 600,000 houses, so that each of its sanitary inspectors had under his charge 3,000 houses and 25,000 persons. The population test was even more unfavourable. In one district, where 296,000 persons resided, there were four inspectors, each having an average population of 74,000 persons under his charge. Their remuneration, too, was totally inadequate. Only nine of the 200 inspectors in London were in receipt of salaries of upwards of £200 per annum, and 112 received less than £150 per year. The London County Council, in view of these facts, was now considering the advisability of insisting on local authorities increasing the remuneration of sanitary inspectors in order to insure a good class of men being attracted to the service. He presented testimonials on behalf of the association to Mr. C. W. Raymond, hon. treasurer, and Mr. W. W. West, past-chairman of the association, in recognition of their services. Each received an illuminated address, accompanied in Mr. Raymond's case with a gold watch, and in that of Mr. West with a writing-case. Other toasts followed.

THE SOCIETY OF ARCHITECTS.—At the monthly meeting of the Society of Architects, held at St. James's Hall, Piccadilly, W., last (Thursday) night, Mr. Walter Emden, J.I., L.C.C., the president, in the chair, Mr. Ernest William Crickmay, of 5, Rood-lane, E.C., was elected a member. The President announced that the annual dinner of the society will take place in London on Thursday, April 21st. Mr. G. A. T. Middleton, A.R.I.B.A., then read a paper, illustrated by numerous lantern views, entitled "Egypt: the Birthplace of Architecture," which is fully reported on page 261.

CHIPS.

Mr. Herbert Spencer's presentation portrait has now been finished by Professor Herkomer, R.A., and will be exhibited at the Royal Academy this year.

For the erection of a new district church in Peterborough, Mr. W. Boyer, of that city, has been appointed architect, and has been instructed to prepare plans for a church to seat 500 persons.

The picture entitled "Sleep," by Mr. Frank Bramley, A.R.A., which attracted some attention at the Royal Academy last summer, has been bought for the permanent collection of the Carnegie Art Gallery, Pittsburg, U.S.A.

The First Commissioner of Works (the Right Hon. A. Akers-Douglas, M.P.) has declared that on and after 1st April next no fees will be demanded for admission to Glasgow Cathedral.

A mansion at Rivington, near Bolton, erected many years ago by Mr. C. J. Stonor, along with 150 acres of the surrounding land, and covering a considerable frontage of the south side of the lower lake, has been purchased by a couple of Lancashire poor law authorities for the purposes of a large institution for the reception of lunatics and imbeciles.

The Rochdale Board of Guardians have decided to build a series of cottage houses for children on the workhouse grounds, at an estimated cost of about £11,500. Provision will be made for 146 beds.

One of the windows in the Guildhall at York is about to be filled with stained glass as a memorial to the late Sir Joseph Terry. The subject will be: King Edward IV. assumes the badge of the House of Lancaster in order to induce the Lord Mayor, John de Gisburne, and citizens to allow him free passage through the city (1471).

Permission has been granted to erect the proposed memorial to the late Sir Charles Craufurd Fraser, V.C., in the Cavalry Church at Aldershot. Mr. George E. Wade, sculptor, has been commissioned to execute the work.

The London County Council have just converted the roadway crossing the viaduct on Hampstead Heath, and running from the Spaniards-road to a spot near Hampstead Heath Railway Station, into a very fine cycle track.

Considerable additions are being made to the head offices of the Gas Light and Coke Co., Westminster, and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

The sewering of the village of Cullompton has just been completed for the Tiverton rural district council. Mr. Barrons has been the engineer, and Mr. Shaddock the contractor.

A movement has been set on foot for a memorial decoration of the school-room of the King's School, Canterbury. It is proposed to retain every piece of oak at present in the room, including the old oak rail (originally part of some cathedral pews), on which so many names and initials have been cut. It is hoped to combine with the new work some of the old oak panelling that belonged to the previous schoolroom (part of the old Almonry Chapel), which was in use from the 16th century down to about 1850.

The River Wear Commissioners have had erected, in order to meet the demand at the Sunderland Docks for warehouse accommodation a new warehouse and transit shed. The building, which is 160ft. long and 46ft. wide, contains three stories, and has been built by Mr. T. P. Shaftoe from plans prepared by officials of the Commission.

The memorial bust of Lord Randolph Churchill, which has been executed by Mr. Storey, A.R.A., for erection within the precincts of the House of Commons is ready to be placed in position; but some structural alterations have to be made for its accommodation, and it will not be inaugurated before the Easter recess.

Colonel A. J. Hepper, a Local Government Board inspector, held an inquiry at Batley Town Hall on Friday in connection with the corporation's application for sanction to borrow a sum of £13,494 for works of surface-water drainage. The borough surveyor, Mr. O. J. Kirby, represented the corporation.

Building Intelligence.

Bourne, Lincolnshire. — The chancel of Bourne Abbey Church was reopened last week after restoration from plans by Mr. J. C. Traylen, A.R.I.B.A., of Stamford and Peterborough. The chancel, as it stands, has no original relation to the building: it is the outcome of necessity. In its entirety, the nave of the Abbey Church extended beyond the space now over-built by the chancel, which was built simply to repair the partially-demolished structure. The roof, as thus made, was one of stolid ugliness. The ideal restoration would have been the continuation eastwards of the grand roof of the nave; but, quite apart from financial considerations, this could not be undertaken, as the building and roof were in a sound condition. The walls and stonework of the chancel have been cleaned down and replastered. The memorial mural tablets have been raised to give way to the warm oak-panelling, which now extends the entire length of the chancel; the seating is of English oak. The eight terminals of the new choir benches carry emblems of the Sacrament of the Lord's Supper. The new screen dividing the nave from the chancel is of English oak tracery, bearing effigies of the four evangelists, with their emblems. Other new features are the Communion rails, prayer-desk, and four three-light brass pendants bearing incandescent lights. The pendants are the work of Messrs. Elgood, of Leicester. The builders' work has been carried out by Messrs. Roberts Bros., of Stamford. The carved work—the emblems and the screen—are by Messrs. Harry Hems and Sons, Exeter.

Edinburgh.—The consecration of the new synagogue, Graham-street, by the Very Rev. Dr. Adler, Chief Rabbi, from London, took place on Sunday week. With the £4,000 the Jewish congregation received from the corporation for their old synagogue in Park-place they purchased the New Greyfriars Free Church, Graham-street, for £2,400, and the balance of the money has been expended in making the interior suitable for the purposes of Jewish worship. Formerly the pulpit stood at the west end of the church, and the seats were arranged accordingly; but the fact that the ark and the pulpit had to be at the east end necessitated an entire reconstruction of the interior. The centre of the design is a reading desk set on a platform in the centre of the area. It has brass rails. The pews slope upward from it on the north, south, and west sides. As no gallery is available for the ladies, space has accordingly been appropriated on the west side of the synagogue, raised, and inclosed with a light brass grill of Oriental pattern. It has a separate entrance. On the east side, on a raised dais and set close to the wall, is the ark. It takes the form of an Oriental baldachino, with pillars at the opening, and having overhead a golden dome and lantern. It is painted in cream, gold, and green colours. The synagogue is seated for 250 men and 130 women. The architect for the reconstruction was M. N. Thomson, Leith.

Gunnersbury, W.—The new chancel at St. James's Church has just been consecrated. Ten years ago the nave and aisles were built, part of the nave being used as a temporary choir and chancel. The new chancel is the same width as the nave, and measures 40ft. in length from the chancel arch to the eastern wall, and the height from floor of choir to the apex of ceiling is 42ft. On the north side are the vestries and organ-chamber, with open arches towards the chancel and nave aisles. On the south side of chancel, facing the High-road, it is proposed to add at a future time a south aisle, which may be used as a morning chapel; but at present the arches are filled in with a temporary wall. The building has been carried out in the Early Pointed style, in harmony with the rest of the church; but the work in the arches, traceried windows, and credence is somewhat richer in character. The oak work of the screens and reredos is in a later style of church work. In the east wall of the chancel there are six large lancet lights, 17ft. high, in pairs, with circular cinquefoil and quatrefoil lights over. These windows will ultimately be filled with painted glass; but at present only the two centre lights are so completed. An oak reredos has been erected at the back of the altar, and is divided into nine panels, with cusped and traceried heads and carved and enriched cornice. The screen dividing the chancel from the nave is of light, open oak work. The nave of the church, owing to the removal of temporary chancel, has had extended pew accommodation added, and the pulpit has been altered and rearranged to suit its new position against the south pier of the chancel arch. The old choir stalls and altar rail have for the present been fitted up in the new chancel, and the existing organ has been moved to its new position on the north side. The building work has been executed by Messrs. Dorey and Co., of Brentford; the oak screens and reredos are by Mr. Caldcleugh, of Darham; the tile floors by Messrs. Carter, Johnson, and Co. The whole of the works have been carried out from the designs and under the personal supervision of the architect, Mr. Howard Chatfeild Clarke, of 63, Bishopsgate-street Within. The cost has been about £2,750.

Newcastle-under-Lyme. — The Bishop of Lichfield recently opened the new institute at the corner of Hassells-street and North-street. It is of red brick, with stone dressings, the style being Late Gothic. There is a low tower over the main entrance, and the principal windows are filled with leaded lights. The large hall or church-room is 63ft. by 28ft., and 25ft. high to the principals. This room is fitted with platform and movable seats, and will also be used as a gymnasium. On the other side of the main corridor are a classroom 30ft. by 21ft., a reading-room 16ft. by 22ft., and a billiard-room 30ft. by 22ft. When required, these three rooms can be used together, being separated by sliding partitions. A smoking-room is situated upstairs, and a kitchen, heating chamber, and lavatory accommodation are also provided. The corridors and other portions of the building have tiled dados. Messrs. R. Scrivener and Sons, of Hanley, have been the architects, and Mr. S. Wilton, jun., of Newcastle, the builder, Mr. E. Peake, of Fenton, putting in the heating apparatus. The total cost has been £3,000.

Royal Palace Hotel, Kensington.—Extensive additions have just been completed, including the Empress rooms, which consist of the largest and best arranged ballroom in London, which is decorated and furnished throughout. The whole of the work was carried out in eleven months. Messrs. Archibald Smith and Stevens supplied the lifts, the Coalbrookdale Company the grates and entrance porch, Messrs. Charles Knowles and Co. the costly Japanese papers, Messrs. Jeffrey the leather papers, Messrs. Graham and Banks the decorations. Messrs. Legg and Son were the architects, and Messrs. Bywater the builders. The clerk of works was Mr. Rowse.

Wakefield.—The new county hall for the West Riding County Council, built on an isolated site in the centre of the city at a cost of £120,000, was opened on Tuesday. The site has an area of 45,156 square yards. The architects, Messrs. Gibson and Russell, of Gray's Inn, W.C., have adopted a Renaissance treatment, the chief features being a dome rising to a height of 130ft. over the main entrance at the corner of Broad-street and Cliffe Parade, and a loggia of six arches in the former street. The main staircase is of Hopton stone and leads to the council chamber, 40ft. by 40ft., and ante room, 26ft. square, both apartments being 24ft. in height. The council chamber is panelled in mahogany and floored with oak blocks, the walls and domed ceiling above the dado being finished in modelled and coloured plaster work. A library, committee rooms, luncheon room, and kitchen are also provided.

In Paisley Dean of Guild Court on Friday, plans of a new eye infirmary to be erected by Provost Mackenzie as a Jubilee gift to Paisley were passed. The building will be of stone, and two stories in height. The site is Mansion House-road. The cost will be about £4,006.

At a meeting of the Godalming Book Club at the Grosvenor School in that town, on Tuesday evening, Mr. Samuel Welman, architect, read a paper on the parish church, in which he traced its history from the days of Ranulf Flambard, Bishop of Durham and Chancellor to William Rufus, until the present time.

The London County Council adopted, on Tuesday, a recommendation of a committee that the erection of a block of working-class dwellings on the Boundary-street area should be intrusted to the Works Department against a hostile amendment by 58 votes to 45. The architect's estimate of cost is £13,715. After a brief discussion it was agreed to contribute £5,000 to the fund for the acquisition of Churchyard Bottom Wood, Highgate.

COMPETITIONS.

Bishop Auckland.—Sir Henry Burdett, to whom the committee had referred the matter, has adjudicated in favour of the plan of Mr. James Garry, of West Hartlepool, for the erection of the Bishop Auckland District Cottage Hospital, projected by Lady Eden.

Harrogate.—The committee of the Harrogate School of Art have received the report of the adjudicators, Messrs. Woodhouse and Willoughby, architects, Manchester, upon the competitive designs for a new technical institute for Harrogate, which is estimated to cost £5,000, in addition to the site. The committee have awarded the three prizes of £20, £10, and £5 as follows:—1, Mr. W. J. Morley, architect, Bradford and Harrogate; 2, Messrs. Bland and Brown, architects, Harrogate; and 3, Mr. J. E. Marshall, architect, Harrogate.

CHIPS.

The urban district council of Herne Bay, at an emergency meeting, have decided to borrow £20,000 to repair the damage to the sea front caused by the great gale in December.

An adjudication in bankruptcy has been made in the case of Harry George Wilkins, of Bristol, builder.

The Marquis of Exeter opened on Thursday in last week a parish house erected in Clare Market in connection with the Church of St. Clement Danes, Strand. The building has been erected upon a piece of ground known as "the island," the gift of Mr. W. F. D. Smith, M.P., at a cost of about £4,000, exclusive of the site, which is valued at about £3,000. It contains a hall with seating accommodation for about 250 persons, and four other rooms, which are to be used for the purposes of a crèche, men's club-room, dining-hall, class-rooms. Messrs. H. and P. Currey were the honorary architects, and Mr. James Carmichael was the builder.

The Bishop of Rochester took part on Thursday last in the reopening and dedication of St. Mary Magdalen, Massinger-street, Old Kent-road. The renovation of the church, vicarage, and schools has cost £3,700.

At Hollingbourne, Mid-Kent, on Friday, an organ which has been built and placed in the parish church by Messrs. Norman Beard, of London and Norwich, was dedicated by Dean Farrar.

At St. Gabriel's, Warwick-square, Pimlico, on Tuesday, Bishop Barry dedicated the reredos, altar-rails, and other decorations in the sanctuary, the cost of which (exceeding £2,500) has been defrayed by Lord Edward Pelham Clinton, Master of the Queen's Household. The subject of the reredos is the Crucifixion. The rest is *opus sectile*, and consists of types of our Lord as Prophet, Priest, and King, and of His Passion.

A mission and parish room in connection with the parish of Elmbridge was opened at Cutnall Green on Tuesday week. The room, which is close to the main road from Droitwich to Kidderminster, will serve many purposes, and at the rear there are ante-rooms and stores. Messrs. L. Sheppard and Sons, of Worcester, were the architects, and the work has been carried out by Messrs. Emuss and Harris, of Droitwich.

The death is announced of Mr. Charles W. Campion, architect and surveyor, which took place at his residence in London-road, Neath, on Sunday, from pneumonia, after a brief illness. The deceased, who was 65 years of age, had lived at Neath for 40 years. His father was an artist, whose pictures were held in very high esteem. Until the formation of district councils took place, Mr. C. W. Campion was surveyor to the Highway Board of Neath Union. Mr. Campion's map of the works and collieries of South Wales is well known. He has left a widow and three daughters.

At Monday's meeting of the urban district council for Hoylake and West Kirby purposes committee, Mr. Leslie H. Dasher, assistant to the city surveyor, Lincoln, was appointed assistant surveyor and assistant inspector of nuisances to the district, at a salary of £100 a year.

The Egyptian Government has signed a contract with Messrs. John Aird and Co. for the construction of barrages at Assouan and at Asuit, the work to be completed in five years, and payment to be made by instalments extending over 30 years. 19,031,065 million cubic mètres of water will be stored. Mr. Garston is the engineer-in-chief. The actual cost of the barrages will be £2,000,000. Inclusive of interest, the total sum to be paid will be £4,800,000, dischargeable by half-yearly instalments of £80,000, extending over a period of 30 years. Messrs. John Aird and Co. have just ordered 3,000,000 barrels of cement in Europe, to be delivered in nine months.

"BLAWITT," GRANGE-OVER-SANDS.—NATIONAL GOLD MEDAL DRAWING OF PULPIT IN ST. CHAD'S CHURCH, BIRMINGHAM.—METROPOLITAN MUSIC HALL, EDGWARE ROAD.—NEW CRICKET PAVILION, DENSTONE COLLEGE.—TWO HOUSES AT CHESTER.—ISOLATION HOME AT CHALFONT ST. PETER'S.—BRIGHTON ARTISANS' DWELLINGS.—PROPOSED PLANS FOR EAST FINCHLEY CONGREGATIONAL HALL AND SCHOOLS.—AN ALABASTER PULPIT.

Our Illustrations.

"BLAWITT," GRANGE-OVER-SANDS.

This house is the result of an alteration which gradually involved almost entire reconstruction of an old house belonging to the late Mr. G. W. Deakin. The general contractor's work was executed by Mr. Enoch Denny, of Grange-over-Sands, and the panelling of hall, dining-room, drawing-room, and billiard-room, and fine staircase up to the first floor by Messrs. Morrison, of Liverpool. The panelling and staircase were all executed in oak. The carving was executed by Mr. Carlisle, of Barbon, Kirkby Lonsdale. The architects were Messrs. Willink and Thicknesse, Liverpool.

PULPIT IN ST. CHAD'S, BIRMINGHAM.

This exceptionally ornate pulpit, originally belonging to the church of St. Gertrude, Louvain, was purchased by the Earl of Shrewsbury, and presented to the Catholic Church of St. Chad's, Birmingham. Though a work of craft rather than design, it is not without merit in the latter, its bold modelling compensating in a measure for the lack of plain surfaces. It is hexagonal in plan, with sunk panels in four faces, the depth of which reduces the internal measurement to 2ft. 4in. The balusters at angles stand clear, differ in design, and vary in plan from concave hexagonal to circular. Originally each had a terminal, as shown in illustration; but these have disappeared together with a similar, but larger, one from central pendant. In each face is a seated figure, in the round and remarkably well cut, representing St. Jerome, St. Gregory, St. Augustine, and St. Ambrose. Two joists from pier, 3in. by 4in., support the whole. The drawings illustrated were awarded a National Gold Medal at South Kensington last year, and are the work of Mr. Wm. Haywood.

THE METROPOLITAN MUSIC HALL.

This well-known variety theatre has just been rebuilt. It occupies the site of the previous "Metropolitan," which was erected in 1862 on the same parcel of land occupied by the "Old White Lion," a hostelry originally founded in 1524, when "Padynton" was but a small village on the Edgware-road. So late as the commencement of the present century Paddington numbered scarcely 2,000 inhabitants; to-day it is one of the largest Parliamentary divisions, with two members of Parliament and 120,000 population. Mr. C. Gray Hill, of Coventry, was the builder of the present new house, and Mr. Frank Matcham is the architect. The construction throughout is fireproof.

NEW CRICKET PAVILION, DENSTONE COLLEGE.

This building has recently been erected on a site adjoining the college chapel and overlooking the playing-field. It is built of red brick, with red sandstone dressings and green slate roof. The external woodwork is painted apple green. The terraces in front of the pavilion are intended to accommodate spectators. The work has been carefully carried out by the contractors, Messrs. Chamberlain Brothers, of Burton-on-Trent. The architect is Mr. Bertram Heywood, M.A.

SEMIDETACHED HOUSES, HOOLE ROAD, CHESTER.

These houses, which are being erected for Mr. Robert Bower, of Chester, are faced with Haydock Colliery pressed bricks, and the roofs are covered with Ruabon brown tiles, supplied by Mr. J. C. Edwards. The builder is Mr. Samuel Manley, Aston, near Nantwich, and the architect is Mr. Richard Hall, Bangor, North Wales.

ISOLATION HOME, CHALFONT ST. PETER'S.

This building, in course of erection, is the gift of Mrs. Dearmer to the National Society for the Employment of Epileptics, and although one of the least in point of size, this home will be by no means the least useful in the working economy of the Colony. In style it will harmonise with the series of buildings already completed or now in progress at the expense of Mr. J. Passmore Edwards, who bought the estate and dedicated it to the objects for which it is now being put by this most useful and indefatigable Society. Rigid economy has had to be studied, and picturesqueness is obtained by the simplest means. The working drawings herewith photographed show the accommodation provided. Red brick and tiles, with stone sparingly used, are the materials employed. The heating is by Messrs. Haden. The builder is Mr. George Darlington. Mr. Maurice B. Adams, F.R.I.B.A., is the architect.

BRIGHTON ARTISANS' DWELLINGS COMPETITION.

The drawings which we publish under this heading are those which were placed first out of nine sets in a competition confined to local architects, and adjudged by the sanitary committee of the Brighton Town Council. In making the award the corporation intimated that they did not intend to adopt the plans in their entirety. The joint authors are Mr. Thomas Garrett, M.S.A., of 30, Ship-street, Brighton, and Mr. W. E. F. Gillam, M.S.A., of 162, North-street, Brighton. There were two sites dealt with, one given to the town by the mayor, Sir John G. Blaker, in the Lewes-road, and the other jointly by Messrs. Daniel Friend and Henry Abbey, in Elm-grove. Messrs. Garrett and Gillam's scheme, as will be seen from the drawings, comprised two descriptions of dwellings; the first of two stories, with back office, containing living-room, kitchen, scullery, and three bedrooms; and the second of three stories, without back office, containing living-room or kitchen, scullery, and three bedrooms. Each house has its own w.c., &c., and is in all respects self-contained. The two-story houses were designed for the whole of the Lewes-road site and for a part of the Elm-grove site, and the three-story houses for the remaining portions of the Elm-grove site where necessitated by the levels of the land. The whole of the drainage is arranged to be kept outside the houses. The fronts are faced with red kiln bricks up to the first-floor level, and above same to eaves with fine rough cast and red kiln brick dressings. The roofs are slated. Forecourts are provided for each house, and open spaces at the rear in conformity to the by-laws. In addition to the usual drawings required, competitors had to take their own levels, and prepare priced detailed sets of quantities, showing the cost of the proposed buildings.

AN ALABASTER PULPIT.

The church of SS. John the Baptist and Patrick, Felling, has been further beautified by the erection of a new marble pulpit, the gift of one of the members of the congregation, Mr. James McGuinness. The pulpit, which is here illustrated, is executed in richly carved, moulded, and polished alabaster, resting on a moulded base of Frosterley marble. The shaft above the base is richly traceried and groined, and has a carved band of conventional vine-leaves and grapes at the pulpit-floor level. On this rests the pulpit proper, which is octagonal on plan, each side of which has two panels, with traceried heads, and the whole is finished by a moulded cornice with battlements and carving. The design is in the Decorated style, and harmonises well with its surroundings and the architecture of the church. This work has been carried out by Messrs. Emley and Sons, Limited, at their Marble Works, Hillgate, Gateshead.

ROYAL ACADEMY DRAWINGS, 1898.

THE last day this year for sending in architectural and decorative drawings to the Royal Academy is Monday, March 28th next.

We have to acknowledge many promises to lend us drawings for reproduction before they are sent in, to be illustrated in our pages after the exhibition opens as in former years. We shall be glad to receive other offers of drawings intended for the Royal Academy, and they should reach us as early as possible, not later than March 24th. Contributors who may wish us to receive and deliver their drawings for them to Burlington House (and we are willing to undertake this free of charge for contributors) must fix a label on the back of the picture and attach another by means of a string. These labels must give the title of the subject, and also the name and address of the sender. The labels can be obtained from the secretary of the Royal Academy of Arts, Burlington House, Piccadilly.

CHIPS.

The Peel Portrait Committee have resolved that, pending the removal of Mr. W. Q. Orchardson's canvas of the ex-Speaker to Burlington House for the Royal Academy Exhibition, it shall be hung in the dining-room of the Speaker's residence in the same position as it is intended to occupy permanently at a later stage.

Three large warehouses forming a stone-fronted block four stories in height have just been built in Golden-lane and Cripplegate-street, E.C., for an ostrich feather merchant. Three hundred girls and men will be employed in the building, which has been erected from plans by Mr. George Vickery, A.R.I.B.A., of 50, Gresham-street, E.C. Messrs. Lawrence and Sons were the builders.

The improvement committee of the town council of Brighton have been considering the question of altering the building by-laws now in force in the borough, one of which has recently been found to give the works committee some difficulty in their desire to deal effectively with the artisans' dwellings proposed to be erected in Elm-grove and on the Lewes-road. On the recommendation of the borough surveyor, they have resolved that the town clerk be instructed to draw up and submit an amendment to the by-laws, providing that in the case of buildings being three stories in height in consequence of a room in the roof, the thickness of the main wall of the building shall be 13in. for the first story, and 8½in. for the remainder of the building.

Another historical work will shortly be added to the decorations of the London Royal Exchange. Mr. Seymour Lucas, R.A., has completed his picture of William the Conqueror granting a charter to the City of London, and this will be placed in proper sequence in the Ambulatory. Mr. Sigismunde Goetze is engaged now on a representation of "King Richard III. being offered the Crown," and Mr. E. A. Abbey on a picture of "Lord Mayor Battlesdon giving his award in the Livery precedence dispute."

It has been decided by the directors of the Vale of Glamorgan Railway Company to construct a loop line so as to avoid for the present the viaduct at Porth Kerry, one of the pillars of which recently collapsed. The work has been intrusted to Messrs. Price and Wills.

The Bill for incorporating the Blackpool and Garstang Railway Company proposes to confer power upon a new company to construct a double line of railway commencing in Blackpool, on the east side of Park-avenue, and terminating at Catterall, by a junction with the London and North-Western Railway, over which running powers are sought to be exercised into Garstang and Catterall Stations. The total length of this railway will be 13¼ miles, and the engineer estimates that it can be constructed for £243,807.

An important change in the market arrangements at Smithfield has just been effected by the City Corporation at a cost of over £20,000. For some years past there has existed in the centre of Smithfield a fish market, but, owing to the position and surroundings, it has proved a failure. The corporation recently resolved to remove the market to a new site in the centre of the vegetable and flower section near the Farringdon Street Railway-station. A number of shops have been erected, and the new market has almost absorbed the vegetable section.

Engineering Notes.

BIRMINGHAM.—The directors of the Great Western Railway are considering a scheme for extension and improvement of their system between Birmingham and Wolverhampton. This scheme, if carried out in its entirety, will involve the expenditure of an enormous sum of money. The idea is to duplicate the metals at Birmingham between the north side of Snow Hill Station, from Charles-street and Handsworth Junction. The company have acquired the whole of the land necessary for the project between Birmingham and Handsworth. The stations at Hockley, Soho, and Handsworth will be materially improved and enlarged, and the goods depots are to be remodelled and increased in size. When the land is prepared, the work of laying down the two additional lines of metals will be begun; but it is not expected that the undertaking will be completed under about two years. The general scheme is much larger, for it is in contemplation as soon as the Birmingham and Handsworth work is finished to double the lines between Snow Hill and Small Heath and between Handsworth Junction and Wolverhampton.

CITY AND BRIXTON RAILWAY.—The shareholders of the City and South London Railway Company have formally approved the Bill for incorporating a City and Brixton Railway Company, and for empowering the latter to construct an underground railway from the City and South London Railway, in Southwark, to Brixton Hill. The proposed company, if sanctioned, will utilise the present terminal station in King William-street and the existing tunnels under the Thames to the Borough, to be abandoned by the City and South London Company on the completion of the extension to Moorgate-street. The City and Brixton line will commence at a junction about 200 yards on the London side of the present Borough Station, and proceed down the Borough-road to St. George's-circus, and then into Lambeth-road and up Kennington-road, passing over the South London line at Kennington Park and on to a point about 30 yards beyond the Brixton Station of the Chatham and Dover Railway. An exchange station communicating with the City and South London Company's Denman-street Station will be made at Denman-street by widening the present tunnels. Passengers from this station will jointly use the lifts and station of the City and South London company. Another station will be at St. George's-circus, and at the Oval there will be an exchange station. The Brixton and City Railway Bill was read a second time in the House of Commons on Monday night.

LEITH.—The new swing bridge across the harbour of Leith, which connects the thoroughfares of Bernard-street and Commercial-street, was opened on Friday. The reconstruction of the bridge was begun in May of last year by the Leith Dock Commission. The contract for the mason work was given to Mr. John Bert, contractor, and the tender for the steel work and hydraulic machinery was placed in the hands of Sir W. G. Armstrong and Company, Newcastle. The total cost has been about £8,000. The length of the structure is 100ft., and the width 37ft. The former drawbridge was 26ft. wide. On the bridge a double line of tramway rails has been laid down in Bernard-street and Commercial-street. On each side of the bridge there is a footpath 7½ft. wide. The bridge is carried on a central cast-iron pivot with steel socket fixed in the massive framework. The structure consists of four steel girders, with two side girders of lattice work, which form the parapets. The bridge weighs 340 tons, and is swung by hydraulic rams. The steel work and hydraulic machinery were erected to the design and under the direction of Mr. Peter Whyte, superintendent of the harbour and docks.

VAUXHALL BRIDGE.—A design for the new bridge over the Thames at Vauxhall has been approved by the London County Council. Sir Alexander R. Binnie, engineer to the Council, has prepared the design, which embodies the principle of a granite bridge backed with concrete. The structure will have the appearance of a granite bridge, and the design permits of it being erected like Waterloo or London Bridge. The bridge will have five arches, supported by four piers and suitable abutments. The central span will be 149ft. 9in., two intermediate spans 144ft. 6¾in., and the two land spans 130ft. 6¾in. each in width. The structure will be 760ft. in length, and only 28ft. in height above Trinity high-water mark. In order to break up the long line of parapet, the engineer has introduced columns, which will ultimately carry the lamps for the illumination of the roadway and the river. The Parliamentary estimate for the cost is £380,000.

CHIPS.

A freehold ground-rent of £200 per annum, secured on No. 79, Lombard-street, with reversion to the rack-rent in 36 years, was sold at the Mart on Tuesday for £12,200, or exactly 61 years' purchase.

Mr. John Whitton, formerly engineer-in-chief of the New South Wales State Railway, has just died in Sydney. Mr. Whitton was born at Wakefield, in Yorkshire, in 1819. After many years' experience on the English railways, he was appointed in March, 1856, on the recommendation of the President of the Board of trade, engineer-in-chief of the New South Wales Railways, and had sole charge of the construction of railways and also of railway surveys in the colony. For many years he was also in charge of the locomotive and permauent way branches. Mr. Whitton retired in 1890.

The urban district council of Newton-in-Makerfield have resolved to establish waterworks for the district in accordance with a report by Mr. Richard Brierley, C.E. The scheme has been reported upon favourably by Mr. D. Gaskin, of Nottingham, and Mr. Hill, water engineer to the Manchester Corporation.

The extensive sawmills and timber-yard of Messrs. Christopher Brown and Co., at West Hartlepool, were destroyed by a fire on Friday. The damage is estimated at £10,000. Many men are thrown out of work.

The sales at the Auction Mart last week, as registered at the Estate Exchange, produced the considerable aggregate of £189,858, in comparison to £94,787 for the corresponding week of last year. The properties on offer were very numerous, but, with few exceptions, not very important in character, and the demand fully kept pace with the increased supply, good prices being maintained throughout.

On Sunday the Bishop of Worcester consecrated the new transepts and nave of St. Margaret's Church, Olton, together with a pulpit, and pews in the north and south aisles, which have been given by two friends of the church. St. Margaret's was opened two years ago, but only proper seating accommodation has hitherto been provided in the nave, chairs having been used in the north and south aisles. These have now been replaced by pews corresponding with those in the nave. The new pulpit is of open traceried work and panels, with a central figure of St. Margaret. The work is by Mr. Bridgman, of Lichfield. The steps leading to the pulpit are of marble. The chancel screen, which is of alabaster, is 3ft. high.

The Duke of Norfolk will lay the foundation-stone of a new public hall and club premises in connection with St. George's Cathedral in Westminster Bridge-road, on Saturday, March 19.

At West Ham on Monday Mr. G. E. Hilleary held an inquest as to the death of William M. Whittell, 48, a builder, lately residing at 22, Idmiston-road, Forest Gate. It was proved that deceased fell from his bicycle in a fit, and, being unable to give his name and address, by the advice of a medical man was conveyed to the West Ham Hospital. The post-mortem examination revealed that death was due to extensive cerebral hemorrhage, caused by extreme muscular exertion. The jury returned a verdict in accordance with the medical evidence.

The Duchess of Cleveland, who some time since presented a stained-glass window to the parish church of St. Mary, Battle, in memory of the late Duke of Cleveland, has now supplemented the gift by the erection of a reredos.

The Guard-street schools for the Workington School Board are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The board of guardians for the Stockport Union met on Monday to consider the proposed erection of a workhouse. There was considerable discussion over a suggestion to divide the contract into two and to let the work to different contractors. Ultimately it was proposed to accept a tender of £138,476 for the whole of the works. An amendment postponing any further action until after the election of a new Board was, however, carried by 17 votes to 15.

The sanitary committee of the Manchester Corporation have reported in favour of an extension of the Monsall Fever Hospital, at an estimated cost of £27,000. It is proposed to construct additional wards—including an isolation ward and an erysipelas ward—with new administrative buildings.

PARLIAMENTARY NOTES.

THE NATIONAL COLLECTIONS.—Sir C. Dilke asked the Chancellor of the Exchequer on Friday whether he had further considered the expediency of a Civil Works Loans Bill for spreading over several years the cost of such works as those connected with the rehousing of portions of the National Collections. The Chancellor of the Exchequer: Yes, sir, I have considered this matter. A Bill has been prepared, and will shortly be introduced.

THE WALLACE COLLECTION.—Mr. Akers-Douglas, in answer to Lord Balcarres on Friday, said: The Trustees of the Wallace Collection have proposed extensive alterations and additions to Hertford House, in order to render it suitable for exhibition purposes. These alterations and additions will be carried out by the Office of Works, and have already been commenced. There is no probability of their being completed and the collection arranged for exhibition at least for 18 months from the present time.

CONDITION OF WESTMINSTER HALL.—CHEMISTS' ADVICE MORE VALUABLE THAN THAT OF ANY AMOUNT OF ARCHITECTS.—Earl Stanhope asked, on Friday, whether, in view of the decay or depreciation of the stone on the south side of the new wall of Westminster Hall, they would take early steps to repair or to silicate the same. He said that on the south-western side of Westminster Hall the new stone had turned a white colour, and decay was rapidly going on. He suggested that a Departmental Committee consisting of a few architects should inspect the wall and see what steps could be taken.—The Earl of Pembroke said that he was informed by the First Commissioner of Works that the wall on the west side of the interior of Westminster Hall had been, since it was refaced by the late Mr. Pearson, the subject of much consideration and concern to the Office of Works, owing to the decay that set in on certain portions immediately after the completion of the work. Two kinds of stone were used in the alteration, Ketton and Anstone, and it was almost entirely in respect to the former that the decay had taken place. Every effort had been made to discover the cause of the decay, even to a minute analysis of both the stone and mortar used in the wall, but without any light being thrown on the subject, and an indurating process recommended by the late Mr. J. L. Pearson, R.A., which was applied in 1896, had not been successful. The failure was the more remarkable because the same stone used on the exterior showed no signs of decay. The matter was receiving every attention, and steps would be taken to apply any process which might give reasonable promise of success. He would represent the suggestion as to the Departmental Committee to the First Commissioner; but it appeared to him to be a chemical rather than an architectural question, and, therefore, any committee who might be appointed should not necessarily be composed of architects, but rather of persons with a knowledge of the chemical process that went on in stones, whose advice would probably be more valuable than that of any amount of architects.

STAINED GLASS.

OLD WHITTINGTON CHURCH, CHESTERFIELD.—This week men have been engaged fixing a stained glass window of three lights and tracery, the subject in the centre light being that of the Crucifixion, and the sinister and dexter lights respectively Nathaniel under the Fig Tree and Christ's Charge to St. Peter, whilst the large tracery is represented with Our Lord in Majesty and Angels with Censers. The details are of an elaborate character. The window is from the studio of Messrs. Swaine, Bourne, and Son, King Edward's-road, Birmingham, under the supervision of Messrs. Rollinson and Son, architects.

The Wakefield and district master builders have decided to form an association. Mr. J. Bagnall, of Eastmoor, has been elected president, and Messrs. E. A. Elvey, of Belle Vue, and H. Fallas, of Horbury, vice-presidents.

Colonel the Marquis of Breadalbane, K.G., opened on Friday a new Volunteer drill hall at Blairgowrie for C Company 5th Volunteer Battalion Royal Highlanders. The building is situated in Union-street, and comprises a drill-hall 60ft. by 40ft., armoury rooms for officers and men, lavatories, &c. The plans were by Mr. Robert Reid, Blairgowrie, and the total cost was £850.

A special meeting of the Bath Board of Guardians was held on Friday to consider a scheme for altering and reconstructing the workhouse on Odd Down so as to meet the requirements of the local government board. The scheme for building a separate and new infirmary at an estimated cost of £40,000 having been disapproved, the scheme now discussed was drawn up by the architect, Mr. Oliver, the cost being estimated at £30,000. It was decided to consult the local government board before coming to a decision as to the plans.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXII. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—F. N.—S. F. B.—D. T. W.—L. H. and Son. N. S. C.—F. D. S.—A. B. (Liverpool).

W. J. B. (We cannot undertake to give legal opinions as between landlord and tenant; but we think you are bound to pay the rent. You may have a claim against the landlord for damages, and we should advise you to consult a solicitor thereon.)—G. J. S. (The company came to grief, and its promoter has since been bankrupt—not under the most creditable circumstances.)

Correspondence.

THE ROYAL GOLD MEDAL AT THE INSTITUTE.

To the Editor of the BUILDING NEWS.

SIR,—The well-reasoned letter of "An Art Worker," which appears in your last issue, does, so far as my main contention is concerned, agree with the general principle which I expressed at No. 9, Conduit-street. I was roused to speak, not because I had any doubts as to the eligibility of our President, but because the nomination came from *the Council*, with a decided colouring of the "snuggery" (as "An Art Worker" puts it), against which I have protested again and again during the last few years.

I may, or may not, agree with the names which "An Art Worker" puts forth as worthy of the Royal Gold Medal; but of one thing I am certain, and that is, that there are gentlemen whom I can name who have thoroughly well esrned the honour which the bestowal of the medal confers, and who have done excellent and laudable service in the direction of that "promotion of architecture," which, according to the Charter of the Institute, constitutes the ground for the grant of the medal.

For example, Did the late Wyatt Papworth do nothing for the promotion of architecture? Has Arthur Cates done nothing to entitle him to the honour? Are his labours on the "Dictionary of Architecture," his work in connection with the Institute examinations, and the fact that during his reign as Crown Surveyor he has secured the very best architectural results on the Crown Estate, to be allowed to pass unnoticed? Has Professor Robert Kerr done nothing towards the elevation of the *literature* of our profession, nothing in his executed works, nothing by the refinement of his intellect, which must have made in years gone by (it did upon mine) such an impression upon the attendants at the meetings at No. 9, Conduit-street, to bring him within the Charter scope of "promotion of architecture"?

And other names could easily be suggested the owners of which are thoroughly entitled to the honour. But, as I said at the Institute, it becomes really impossible to suggest any name at all, because the "snuggery," by its action, places a distinct obstacle in the way—the obstacle being that if one presses forward a candidate, however worthy, it is at the cost of fighting one's own President. The want of tact, the want of mere common-sense, the want of consideration for the privileges of the general body of members, are indelibly impressed upon the action of the Council. They, and they alone, are responsible for placing our President in the position in which he is placed. They have permitted to arise a little blot upon what should, and would a little later on, have been a clear and fair shield; and if I were the President, I should say, "Save me from my friends!" The Council have proceeded in this matter exactly as they have done in many other instances: they think and act as if the whole corporate body were mere subscribers of so many guineas a year, and had no voice whatever in the affairs of the Institute; they arrogate to themselves any outside attraction which they can secure; they comfort themselves with all the attributes of a mutual admiratiom society; they send forth opinions and plans as the work of "The Royal Institute of British Architects," of which that Royal Institute is absolutely and entirely ignorant, and upon which it is completely uninformed; they endeavour to suppress from the *Journal* all that may expose their shortcomings; and, finally, they seek to gather into their own undivided and precious hands the bestowal of the Royal Gold Medal, that signal honour the bestowal of which the Charter confers upon the corporate body.

It is against this line of conduct which I have persistently and consistently protested, and against which I shall, on every proper occasion, continue to protest; and I am happy to find that, although "An Art Worker" does not "approve of my methods," he at least is with me in the endeavour to prevent our prerogatives being gradually filched from us by a practically self-elected permanent council.—I am, &c.,

WM. WOODWARD.

13, Southampton-street, Strand, Feb. 23.

CHIPS.

The Bishop of Rochester on Saturday consecrated the new church of Holy Trinity, Roehampton, the foundation-stone of which was laid in April, 1896, by the late Duchess of Teck.

The Great Western Railway Company are about to expend about £40,000 in building a new station at Carmarthen, and a smaller amount in erecting a goods station at Tenby.

At the last meeting of the Hants County Council, it was announced that a residence had been erected for the chaplain at the county lunatic asylum at Fareham, from plans by Messrs. Cancellor and Hill, of Winchester, Messrs. Green being the contractors. Plans and a report by the county surveyor were submitted for the extension of the asylum at a cost of £21,000 by the addition of infirmary wards containing 150 beds. This extension will raise the accommodation to 1,200 beds, its full limit of capacity. The plans were approved. It transpired that the entire cost to the county of preparing plans were £100 paid to a draughtsman, whereas if the council had consulted an outside architect the outlay would probably have been from £1,400 to £2,000.

At a general meeting of the Royal Society of Painters in Water Colours held on Friday evening, Messrs. Louis Davies and James Paterson were elected Associates.

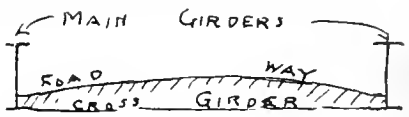
The Lowestoft Town Council have decided to place 40 groynes upon their south beach from the south pier to the borough boundary, at a cost of £1,300. The borough surveyor has been instructed to prepare plans for a concrete sea-wall to protect the Denes. A Horsfall refuse destructor has been determined upon, the cost of which will be £3,000.

Intercommunication.

QUESTIONS.

[11903.]—**Specifications.**—What is the exact meaning in the following extract from specification for painting new plastered walls? "The walls shall be cleaned down, prepared, sized, and painted three coats of lead paint in approved tints." What I want to know is the word "prepariog" to be taken as meaning a coat of oil and driers, or is such coat to be taken as meaning the first coat of the three coats of lead paint as specified? If the latter, then the word "preparing," as applied to new work, is a misnomer, because all that is required to be done in new work is cleaning down after ceiling whitening, and then the oil and drier coat to receive paint.—PERPLEXED STUDENT.

[11904.]—**Wind Pressure on Bridge Girders.**—Can anyone inform me how wind pressure is allowed for on the main girders of a plate-girder bridge, and should any allowance be made for vertical pressure? The outline cross-section of bridge would be like this:—



I have been unable, so far, to find any reference to this in books on bridge construction.—C. E.

[11905.]—**Balloon Framing, Plastering, &c.**—I shall be glad of information on the subject of balloon framing as practised by the Americans, and if any correspondent can recommend a cheap book on the subject I shall be obliged. I shall also be glad to know how Portland cement plastering is done on lathwork. Owing to the brittleness of the mortar, plasterers tell me they cannot work it satisfactorily on laths. Masons also object to using Portland-cement mortar for walling for the same reason. I am told that one part of cement to six of sand, with one part of foundry loam added to make it work fat, makes a very strong mortar. The fouodry loam in country districts is, however, difficult to get. Would putting lime answer as well as the loam for toughening purposes while working? I am aware that the lime would weaken the mortar; but so would the loam. Will blue lias lime gauged with Portland cement make a satisfactory plaster for outside work? If so, in what proportion should the lime, cement, and sand be used; and should hair be incorporated with the mortar? An answer will be much appreciated.—EXCALIBER.

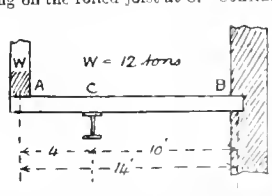
[11906.]—**Houee Drainage**—How can a detached villa, nearly square in block, be drained? The soil-pipe and bath-waste come down at the back, and the scullery sink is on the right-hand side, not far from corner. Is it necessary to have an inspection chamber where these drains meet, besides one in front of house next the road along which the sewer runs? It seems necessary to run the main house drain down the right-hand side of house between these two chambers, and to make separate branches into it for rain-water pipes. Am I right here? Then is it necessary to ventilate the manholes, or which one—probsbly the interceptor? Are there any good patterns of gully traps for stackpipes in stoneware or iron? Will be glad of information.—DOMUS.

[11907.]—**Jointing Drain-Pipes.**—I should be glad to hesr the opinions of practical correspondents as to the most desirable joint for drain-pipes (stoneware). Some recommend neat cement, others cement and sand in certain proportions; others prefer the Stanford patent joint. Which has been found to answer the best in ground that is clayey, or that is apt to settle? Is there much difference in cost?—SIGMA.

[11908.]—**Plastering Hospital Wards.**—Is there any plaster or cement specially used for this purpose? Is Keen's or Parian cement a good covering for walls where hardness and non-porosity and cleanliness are necessary? A tiled dado is often provided. An opinion from a specialist will be valued.—A. L.

REPLIES.

[11887.]—**Load on Girder.**—Let A B represent the girder resting on the rolled joist at C. Consider A B as a



lever whose fulcrum is B, loaded with weight W at the end A. Let x = the pressure on rolled joist at C. Then, taking moments about fulcrum B, we have—

$$x \times C\,B = W \times A\,B.$$

or— $10x = 14 \times 12.$

Therefore— $x = \frac{14 \times 12}{10} = 16.8$ tons.

Hence the pressure at C is 16·8 tons. H. BUSHRIDGE.

[11900.]—**Waterproofing Rough-Cast.**—A rubble wall rough-cast is very exposed to be attacked by driving rain. Its very roughness favours the lodgment of water. "H. C. S." recommends saturating the wall with several applications of hot boiled oil, or linseed oil, in which glue has been dissolved. Boiled oil will do good, and the gelatine solution, and the tallow soap in boiling water are useful as preventives of dampness, by closing the pores of the plaster. Szerelney's solutions and the "Fluate" supplied by the Bath stone firms are also found to prevent the percolation of moisture, and "Enquirer" might try them. They both waterproof the stone or plaster. If these fail, I should recommend the wall to be battened inside.—A BUILDER.

LEGAL INTELLIGENCE.

CLAIM BY AN ARCHITECT.—At a special sitting of Chester County Court, last week, his Honour Sir Horatio Lloyd was engaged for several hours in hearing an action brought by Daniel J. Kennedy, surveyor and architect, Liverpool, to recover £31 10s. from John Bird, landlord of the Fielding Arms Hotel, Pantasaph, for professional services and expenses incurred. Plaintiff's case was that while he was engaged doing some work in the neighbourhood of Holywell Convent for Mr. Kirby, architect, Liverpool, he was introduced to defendant, and subsequently he prepared plans for the erection of nine cottages and a shop at Holywell for defendant. The plans were passed by the urban district council; but at the last moment defendant was not able to raise the mortgage money, and accordingly was not able to carry the work out, so plaintiff did not prepare the specifications. Finally plaintiff pressed for the payment of his bill, and defendant offered him three guineas. Plaintiff estimated that the work could be done for £1,100, and he charged commission at the rate of 2½ per cent. on that amount. Plaintiff denied that it was suggested that he should do the work for defendant in a friendly manner. Evidence in support of plaintiff's case was given by Mr. Whalley, architect, Chester, and Mr. Owen, architect, Liverpool. For the defendant it was contended that this was an arrangement based on friendship. Plaintiff went down and stayed occasionally with defendant, who did not charge him anything, and Mr. Bird being anxious to help plaintiff in his business, introduced him to Mr. Montgomery, a brewer. There was no understanding as to payment for the plans, and defendant did not adopt them because he was informed by a builder that if the buildings were erected according to them they would cost something like £2,000 instead of £1,000. It was further claimed that plaintiff was not entitled to commission in a speculative transaction of this kind, and that £6 paid into court by defendant was all plaintiff was entitled to. His Honour pointed out that the £6 was not paid into court in time, nor was it paid with any proportionate costs, so that in two respects it failed. The payment of the money into court determined the verdict, except as to the amount. Defendant's counsel submitted that plaintiff's charges were excessive, and he called two Liverpool architects in support of this view. His Honour, in giving judgment, said he could quite understand that owing to the hilly nature of the site of the proposed buildings plaintiff's work was not easy. On the other hand, the parties met in a friendly kind of way, and there was a good deal of mutual obligation. With regard to the contention that the plans could not be carried out at the proposed cost, he pointed out that it was often necessary to ask architects to cut down their plans. Under all the circumstances, he should give plaintiff a verdict for ten guineas, with costs on that amount.

LIBEL ACTION AGAINST A CITY SURVEYOR.—NASH v. DAVIS.—At the Bristol Assizes, before Mr. Justice Darling and a special jury, an action was heard on Wednesday and Thursday in last week, in which Percy Alan Nash sued Charles Edward Davis, city surveyor, of Bath. The statement of claim alleged that the defendant libelled the plaintiff by the publication of a certain statement with regard to the construction of a proposed new road at Bath, from the end of Pierrepont-street to Pulteney-street. Damages were laid at £250. Defendant denied the allegation, and stated that what he did publish was in his official capacity at the request of the corporation of Bath. Plaintiff's counsel stated that the plaintiff was for a time in the employ of the defendant. In 1885 the plaintiff conceived an idea of making a new road over waste lands of the corporation, and joining Pierrepont-street, Bridge-street, and Pulteney-bridge, and this plan eventually came before the notice of the corporation. Plaintiff mentioned the plans to the defendant, who said, "That is no good: I tried it myself thirty years ago, and failed to carry it." A few days afterwards Mr. Nash met Mr. William Lewis, and showed him the plans, which Mr. Lewis showed to Alderman Jolly. They were eventually deposited at the town clerk's office. After a time the plaintiff heard that these plans had been submitted to the corporate property committee by the defendant as being copies of plans prepared by himself. These plans were afterwards dealt with in a report which the defendant, as architect for the city of Bath, had prepared, and which was printed and fixed in the Guildhall. It was in this report that the libel complained of was published, as follows:—"In 1895, in consequence of a letter from the town clerk, Mr. Hunter called at my office. He asked my clerk, Mr. Nash, to show him the plan of the road. In my absence, Mr. Nash made search in Pulteney-street for the plan, and again the same day, accompanied by a pupil, but unsuccessfully. I found the plans of the roads 'not in their accustomed place.' Shortly after this Mr. Nash informed me that he had been making a plan for a new road from Pierrepont-street to New Market-row, which Mr. Moger, clerk to the urban sanitary authority, and father-in-law to Mr. Nash, thought excellent. On his describing it to me I recognised it as the same as my own. I told him so, and I thought my so expressing myself was sufficient, and from his being in my employ, in possession of knowledge that otherwise would not have been the case, I consider that in this matter he has not been loyal to me. Mr. Nash has been in my constant employ something like ten years, exclusive of a short time when he started for himself, but, on his solicitation to return, I again availed myself of his services." Counsel thought the charge of disloyalty was a very grave charge to a professional man. The plain innuendo was that the plaintiff took advantage of his position, surreptitiously copied plans, and put them before the council as his own. Anything more injurious than this to a man in his client's position he could hardly imagine. Percy Alan Nash, the plaintiff, corroborated this opening statement. Cross-examined: He never saw an entry in the defendant's index box relating to drawings for the Orange Grove-road. In the summer of 1895 Major Davis left his old office in Pulteney-street, which remained unoccupied, except for the old papers which remained in the pigeonholes. He took a Mr. Clarke there to look for some plans of the house. Mr. Clarke never asked to see the plans of the new road. His lordship remarked that it was somewhat odd that due north was at the upper part of the original plans, but not on the Ordnance maps, though the same peculiarity was observed in the new plans prepared by plaintiff. Plaintiff, in reply to Dr. Blake Odgers, stated that after Major Davis had expressed disapproval of what witness had done, he had his plans lithographed, and sent copies to members of the town council. He did not consider he was competing against his employer in what he did. It would have been wrong to have so competed with his employer in this matter. Evidence of publication of the alleged libel was given. For the defendant it was argued that there was no evidence of malice disclosed. Defendant's clerk had done something improper, and, when called upon to make this report, Major Davis had been bound to refer to it. He was not responsible for what the members of the town council might think fit to do. They ordered this report to be printed at the expense of the corporation. The occasion for the publication was privileged. Mr. Cyril Thompson, an architect and surveyor in private practice in Bristol, said he was formerly a pupil of the defendant at Bath. Plaintiff was there at the time. At the request of defendant he made an index of the plans at the offices in Pulteney-street, including a roll of plans relating to a proposed new road from Pulteney-street to Pierrepont-street. Major Davis, city architect and town surveyor of Bath, said he was appointed to the office in 1863. Before 1865 a new street was projected from Pierrepont-street, and the matter had frequently been discussed since, fresh plans being prepared from time to time. From 1884 to 1895 the matter went to sleep. When first told by plaintiff that he had prepared a scheme for this proposed road, he expressed annoyance and said it was part and parcel of a scheme he had been trying to get adopted for the last 30 years. Later on witness laid before the council his original plans, whereupon one of the members produced plaintiff's lithographed plan, and said it was a copy. He never had any malice against plaintiff, and he never showed his reports to anyone outside the town council. Cross-examined: The words complained of in his report did not mean that plaintiff had tampered with the plans of witness, but he suggested that they were competitive. He was engaged at a nominal salary, with commission. He considered that the corporation were bound to employ him upon all their works, but they did not think the same. The Judge, in summing-up, said he had already held that defendant had a right to write the words complained of, because he was acting under the cover of privilege. If the jury believed Major Davis was instructed by the town clerk or his assistant to get this report printed, where was there any malice? They must also remember the time defendant kept plaintiff in his employ after he had prepared his scheme, when they were considering the question of malice. He should put before the jury four questions:—(1) Was the publication of defendant's MS., including the report—which contained the words complained of—in consequence of instructions to that effect given by the corporation? (2) Did the defendant instruct the printer to print his MS. in consequence of directions given to that effect by the corporation? (3) Was defendant actuated by malice in writing or in publishing the words complained of? (4) Was plaintiff not loyal to defendant? The jury answered the first two questions in the affirmative, the third in the negative, and, with regard to the last, they said plaintiff was not loyal. A verdict entered for defendant accordingly.

IN RE T. W. LACEY, OF ROCHESTER.—A receiving order was made against Thomas William Lacey, described as a surveyor, by the Rochester County Court on December 3 last. The proceedings have since been transferred to the High Court, and recently a sitting for the public examination was held before Mr. Registrar Brougham, sitting at the London Bankruptcy Court. The accounts showed liabilities £2,780, of which £330 are unsecured, with an estimated surplus in assets of £749. It appeared that the debtor has failed on four previous occasions, and he ascribed his present position to a judgment having been obtained against him in respect of a disputed claim for building materials alleged to have been supplied under his guarantee. Upon the case being called, the Registrar remarked that an application for adjudication was recently adjourned to enable the debtor to pay the debts in full. Applications were also pending for orders of discharge under the previous failures, and under the circumstances it might be more convenient if the present sitting was adjourned. This course was adopted, and the case was adjourned until March 25 next.

ALLEGED BREACH OF CONTRACT.—On Wednesday and Thursday in last week, Mr. Justice Bruce and a special jury were occupied with an action for breach of contract against the Era Spinning Company of Rochdale. The plaintiffs were Messrs. Astin and Barker, of Todmorden, who obtained the contract for the supply of cast ironwork to be used in the defendants' new mill in Woodbine-street, Rochdale, and they claimed damages on the ground that the Era Company subsequently broke the agreement and gave the unfinished work to another firm. The case for the defence was that the contract was rescinded by mutual consent. There was a great conflict of evidence, but during the hearing of the case for the defence the jury stopped the proceedings and gave a verdict for the Era Company.

CHIPS.

A site for public baths has been purchased at Frome by a local committee, who have instructed Mr. P. Edinger, the town surveyor, to prepare plans for a swimming bath 75ft. by 30ft., at a cost not exceeding £1,500, with the addition of four slipper baths.

The will and codicil of Mr. Frederick Dale Banister, J.P., of Stonehouse, Forest-row, Sussex, the chief resident engineer of the London, Brighton, and South Coast Railway, who died on December 22nd, have been proved, the value of the personal estate being £16,169 2s. 11d. gross and £12,219 6s. 5d. net.

In the application for discharge from bankruptcy in the case of Thomas French, Overbury-street, Clapton Park, N., builder, the discharge has been suspended for three weeks, ending February 10, 1898.

Mr. Arthur Cross is presenting a new organ to St. Michael's, Chester-square, at a cost of £2,000. He has intrusted the construction to Mr. Hope Jones. He is also about to build and endow a convalescent home, entirely for the use of the poor of St. Michael's parish.

The death took place suddenly on Tuesday week of Mr. David Roberts, of Transcend House, Llandudno, in his 76th year. The deceased, who was a retired builder and contractor, went to Llandudno over 50 years ago, when the place was but an obscure village. He was among the first builders to erect lodging-houses at the "Queen of Welsh Watering-places," and had been a member of the old board of the town improvement commissioners. He was a poet and hymn-writer, being known in Welsh bardic circles as "Boreufardd."

The presentation to the Art Gallery Committee of the Manchester Corporation of a reproduction in bronze of Mr. John Cassidy's terminal bust of Mr. Henry Clarence Whaite, R.W.S., president of the Manchester Academy of Fine Arts, took place at the Art Gallery, Mosley-street, in that city, on Tuesday week.

The dissolution of partnership is announced of W. Kidner and W. H. Atkins Berry, architects and surveyors, Old Broad-street, E.C., under the style of Kidner and Berry. Also the partnership hitherto subsisting between G. Bywaters, A. Bywaters, W. D. Bywaters, F. S. Bywaters, and A. J. Bywaters, builders, King-street, Regent-street, W., under the style of G. H. and A. Bywaters and Sons, so far as regards G. Bywaters and A. Bywaters has been dissolved.

The trustees of the Birmingham Churches Fund have appointed Sir Arthur W. Blomfield, A.R.A., to act as their assessor, and decided to invite a number of architects to compete for the erection of a new church in the parish of Sparkbrook in the place of Christ Church, Birmingham.

The oldest Wesleyan Methodist Chapel in Manchester is shortly to be vacated and afterwards demolished by the Great Northern Railway Company. It is the Great Bridgewater Street chapel, which was erected in 1800.

At Friday's meeting of the Conway and Colwyn Water Board, it was reported that the result of the arbitration between the contractor (Mr. Bugbird) and the board on a claim of £638 had been in favour of the former for £482. The award settles everything between the board and the contractor.

Our Office Table.

M. PAUL PERDRIZET, the well-known French archæologist, gave at the Passmore Edwards Settlement, on Tuesday, an address on the recent excavations by his countrymen at Delphi. Sir John Evans presided. M. Pedrizet, who gave his address in French, made the tour of the precincts, starting from the Treasury of the Athenians and ending with the Stadium. He dwelt on the interest of the ancient precinct of Gaia, the Earth Goddess, the primitive mistress of the oracle displaced by Apollo. The rock of the Sibyl, the traditional seat of the first priestess, was shown, and M. Perdrizet hazarded the conjecture that the unfilleted *omphalos* found in the Treasury of the Athenians was the original altar of Gaia herself. The mutilated metopes of the Athenian Treasury were also exhibited. The Temple of Apollo was discussed, and the lecturer made clear how again and again it had suffered destruction from earthquakes. The temple, of which the foundation has been laid bare by the French, is of the 4th century B.C., but built into its foundations at the west end are portions of the earlier temple of the Alkmæonidæ; fragments, too, of the sculptures of this earlier temple remain in the mass of *débris* heaped up when the ground was cleared for the new structure. Below the foundations of the west portion of the temple are traceable the rocks that once formed the prophetic chasm noted by Aristotle as within the temple. While the French excavations were in process Delphi was visited by an earthquake. At the close of the lecture Dr. A. S. Murray, who had visited the site himself, moved a vote of thanks; the excavations at Delphi, he said, in point of scientific importance, stood second to none.

MR. JAS. PATON, Curator of the Glasgow Corporation Art Galleries, delivered on Monday night in those galleries the tenth of his addresses on the Italian painters, his subject on this occasion being Tintoretto and Paolo Veronese. After dealing with the early life and training of Tintoretto, the lecturer said there was never a man more wedded to his art or disinterested in its prosecution. He would paint for the price of his materials or for nothing rather than not paint at all; and such was his unworldliness that in his later days he had to be guarded by his family against unscrupulous visitors. He worked with an incredible impetuosity of temperament and boldness of will. He conceived his figures on the grand lines of Michael Angelo; his fertility of invention was inexhaustible; his imagination was as comprehensive as it was active and untiring. His own restless activity and energy are reflected in the tumultuous and sometimes melodramatic action of the crowded figures in his picture. In his earlier works, mythological as well as religious, he is somewhat timid and restrained; but he gives full rein to his fiery imagination and boundless energy in his series of pictures, "The Miracles of St. Mark," which have been designated as among the most gorgeous pages in the history of art. In his mature works he revolutionises and gives an air of modernity to the traditional subjects with such boldness of invention, with such vivacity of movement and gesture, with such fertility of combination in grouping and decoration, such passionate warmth in the execution, and occasionally with such pathetic grandeur in the expression, that in the presence of such mastery surprise even exceeds admiration.

THE annual report of the National Footpath Preservation Society states that three more corporations have joined the society, with two district councils and four parish councils. Receipts from members have amounted to £233 6s., and the total income to £288. The expenses for the past year amounted to £259 12s., and the balance carried over was, therefore, £23 8s. The footpath cases during the year were not quite so numerous as in the previous year, the number being 271, against 290. The past year is stated to have been most disastrous as to law proceedings respecting rights of way. The first important matter was the Winter Hill case, near Bolton. It occupied the Court at Bolton seven days in March last, and judgment was given against the right of way by Vice-Chancellor Hall. The next matter took place in Dublin almost at the same time—the Giant's Causeway case. This also occupied seven days, and judgment was given by Vice-Chancellor Chatterton in Dublin against the right of way on April 29 last. An appeal has been heard. The next case was an alleged right of way near Spennymore in Durham; the judgment in this matter was also adverse to the claim of the public. An appeal was heard, but unfortunately failed. The fourth case was that of Paddock Wood, Surrey: the jury could not agree, and the verdict of the majority was taken against the right of way.

THE properties exposed for sale in Glasgow during 1897 amounted in value to £924,413; while those of 1896 were £771,880—an increase for 1897 of £152,533. In the city of Glasgow and the suburbs the statistics show that property was exposed at £2,127,668, and there was realised £716,458, being a gain on the upset price of £33,925. In 1897 feu-duties of the annual value of £944 exposed at the upset price of £29,900 fetched £30,600—an increase of £700, showing that something between 31½ and 31¾ years' purchase was asked; while the price actually realised figures out at fully 32½ years' purchase. In 1896 the upset price began at the average of 30¼ and finished a fraction over 31½ years' purchase, proving that 1897 commenced higher than the previous year's highest, and finished nearly a year's purchase higher. The annual value of ground annuals exposed last year was £1,076, at the cumulo amount of £33,632, or a little over 31¼ years' purchase. These fetched £35,040, or a little over 32½. The gross rental of Glasgow for 1897-98 is:—Dwelling-houses, £2,030,334; other subjects (including railways and canals), £2,501,845 total, £4,532,179; empty dwelling-houses, £46,903; other untenanted subjects, £75,478—total, £122,381. This is an increase in the rental as compared with the preceding year of £99,603, and a decrease in the empty property of £22,451.

A SERIES of experiments on the strength of timber is being carried out on a large scale for the United States Government by Dr. B. E. Fernow, of the Forestry Division of their Department of Agriculture. To examine and test a sufficient number of specimens of any given species is a costly undertaking; but the department has preferred to expend its appropriations in doing thorough work on a limited number of species rather than in doing more or less superficial work upon a larger variety. During the past year Dr. Fernow rented a testing machine with which to carry on his investigations. In the course of his work he made the important discovery that a constant mathematical relation exists between the compressive and the tensile tests of any species of timber, and that henceforth it will be sufficient to make a laboratory compressive test, the tensile strength being calculable from the data so obtained. Dr. Fernow gives the credit for this important discovery to Mr. S. F. Neely, one of his assistants.

The coast tram service between Lytham and Blackpool, a distance of nine miles, was commenced on Monday, and the line is to be extended to Fleetwood, eleven miles further on. The system of traction employed is gas, which, although known on the Continent, is now for the first time being tried in England.

Two stained-glass windows were placed in St. Oswald Church, Thirsk, on Friday, to the memory of the late vicar, the Rev. L. G. Maine, M.A., and Mrs. Lambert, the founder of the local hospital.

A memorial window to the late Mr. James Sharrocks, Newhold, is to be erected in the chancel of St. Peter's Church, Rochdale. The subject is "The Good Samaritan." The work has been intrusted to Messrs. Comere and Capronnier, of Brussels.

The church of St. Mary the Virgin, Aldermanbury, E.C., is about to be entirely redecorated from the designs of Mr. Lewis E. G. Collins, A.R.I.B.A., of 31, Great St. Helen's, E.C.

The directors of the Bath Stone Firms, Limited, have decided to recommend a dividend for the six months ending Dec. 31, 1897, at the rate of 11 per cent. per annum, making, with the interim dividend paid in September, 9¾ per cent. for the year. The annual meeting will be held on March 11, and the transfer books will be closed from the 26th inst. to March 11, both inclusive.

Mr. T. G. Taylor, borough surveyor of Douglas, Isle-of-Man, has been appointed borough surveyor of Ramsgate out of 120 applicants. Mr. Taylor went to Douglas from Leicester about nine years ago, and during his term of office has carried out many important works. His salary at Douglas was £200 a year, and his commencing salary at Ramsgate is £350, rising to £400 in two years.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Society of Arts. "The Principles of Design in Form," Cantor Lecture No. 3, by Hugh Stannus. 8 p.m.
Carpenters' Hall Free Lectures. "Some Notable Buildings in France," by Prof. T. Roger Smith, F.R.I.B.A. 8 p.m.

TUESDAY.—Institution of Civil Engineers. Discussion on "Alternate-Current Motors" and on "The Dublin Electric Tramway."

WEDNESDAY.—Society of Arts. "Kites: their Theory and Practice," by Captain B. F.S. Baden-Powell. 8 p.m.
Edinburgh Architectural Society. "Combined System of Steam-Heating and Cooking and Domestic Hot-Water Supply," by A. Hunter Crawford. 8 p.m.

FRIDAY.—Birmingham Architectural Association. Lecture by Professor G. Aitchison, R.A., P.R.I.B.A. 6.45 p.m.

CHIPS.

It has been decided that the memorial, at Horncastle, to the late Mr. Edward Stanhope, shall take the form of an obelisk with granite base, to stand in the Market-place at Horncastle.

The parish church of St. Mary, Tadcaster, was reopened on Saturday, after undergoing repairs and extensions which have been carried out at a cost of £1,300.

Colonel Jeremy-Taylor Marsh, R.E., an inspector under the Local Government Board, held an inquiry at the Council Chamber, Leeds Town-hall, yesterday, into an application by the City Corporation for powers to compulsorily acquire certain properties, under the Lands Clauses Act, for purposes of street improvements. To the principal proposal of the corporation, that for a new street from Briggate to Vicar-lane, considerable opposition was offered.

A new church to be dedicated to St. Martin is to be built in Edinburgh from plans by Mr. Robertson, of Inverness, at a cost of £5,000.

On Saturday night the Dublin Master Builders' Association held their annual dinner at Jury's Hotel in that city. The company numbered about ninety. The Right Hon. J. M. Meade, LL.D., president of the association, occupied the chair, and responded to the toast of the evening, which was proposed by the High Sheriff of Dublin, Alderman Pile. The toast of "The Architects" was proposed from the chair, and acknowledged by Messrs. W. M. Mitchell, W. Kaye Parry, and R. C. Orpen.

A movement is on foot for building a public hall for Liverpool. The site is near Emmanuel Church, West Derby-road, and it is proposed to erect a hall to accommodate 6,000 persons, besides room for another 1,000 on the stage. The style will be Lombardic, and the building materials red brick and terracotta. Under the stage will be a niche or hall to seat 700 persons, and the entire cost of halls and shops is estimated at £60,000. Mr. W. Parslow, of Duke-street, Liverpool, is the architect to the promoters.

Mr. Henry Yates Thompson has arranged to provide for Stanley-park, Liverpool, a palm-house somewhat similar to one he placed in Sefton-park in the same city in 1896. The Sefton-park palm-house and its plants cost over £12,000; that for Stanley-park will be about 120ft. long, and will cost about £6,000. Mr. Thompson waited upon the parks and gardens committee of the corporation on Wednesday with Mr. Mackenzie, of the firm of Mackenzie and Moncury, horticultural builders, Edinburgh, who submitted the plans of the structure which the firm will build. Mr. Thompson was warmly thanked by the committee.

A proposal to extend the Walker Art Gallery at Liverpool is now occupying the attention of the corporate committee controlling that institution. In order that the pictures in the permanent collection may be hung to the best advantage, considerable additional space is required.

At the last meeting of the urban district counsel for Littleborough, Lancs., the clerk read a letter from Messrs. Clark and Hutchinson, architects, John-street, Bedford Row, W.C., asking whether it is the intention of the council to proceed with the erection of the proposed new offices, fire engine station, &c., this spring. Messrs. Clark and Hutchinson won the premium which the council offered several years ago for the best plan for these buildings, and they have written several times, at long intervals, asking whether the council intend to proceed with the work. After some discussion, it was decided to reply that the council do not at present propose to commence the buildings.

A new Wesleyan chapel, erected in Dearne-street, Brightside, Sheffield, was opened on Thursday in last week by the President of the Conference. The building has cost about £2,255, and it provides accommodation for nearly 400 persons.

A large mansion on the Wayndete estate, Bristol, has been presented to the city by Mr. Edward P. Wills, for the Convalescent Home. The building is situated in its own grounds of three and a half acres, on the borders of Durdham Down. The grounds are well laid out, and the aspect on all sides is open and airy.

Trade News.

WAGES MOVEMENTS.

CARDIFF.—The masons' strike has ended. At the Royal Hotel on Wednesday week a meeting was held of the representatives of the masters and men, and, after discussion, terms were arranged, subject to approval by the Masters' Association at their general meeting on the following night. The men concede the right of the employers to purchase the dressed stone from Messrs. Turner and Co., or any other firm, and they have also acquiesced in the masters' demand that they shall be allowed to purchase dressed stone ontside the town, provided the rate of wages paid for dressing is not less than those ruling at Cardiff for the same work. The men returned to work on Monday morning.

LEICESTER.—Some months ago the Leicester branch of the Carpenters' and Joiners' Society gave notice of a demand for an advance in wages, as well as an amendment of the rules which govern the trade. This notice expires at the end of this month. Councillor T. Smith, the local representative of the Board of Trade, has been requested to preside over a joint conference.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

ALFORD, LINCS.—For erecting a granite Jubilee memorial drinking fountain:—
Curtis, G. (accepted).

ASSOUAN, EGYPT.—For the construction of barrages on the Nile at Assouan and at Asuit, for the Egyptian Government. Mr. John Henry Garstin, C.S.I., of Cairo, engineer:—
Aird, J., & Co., London (accepted) about £300,000

BATTERSEA, S.W.—For the enlargement and alteration of the fire-brigade station, for the London County Council:—

Marchant and Hirst	...	...	£6,195	0 0
Try, J. N.	...	...	5,337	10 11
Stimpson and Co.	...	...	5,170	0 0
Kearley, C. F. (accepted)	...	...	4,895	0 0

BETHNAL GREEN, E.—For alterations required in the stables of the Bethnal Green Fire-Brigade Station, to admit of an additional pair of horses being kept there, for the London County Council:—

Hearle and Farrow	...	...	£78	0 0
Wood, F. and F. J.	...	...	66	0 0
Smith, A. D., and Sons	...	...	65	12 0
Jarvis, J., and Son (accepted)	...	...	55	0 0

BOURNEMOUTH.—For making-up Campbell, Heath Farm, Richmond Park, and Shaftesbury roads, Bournemouth. Mr. F. W. Lacy, M.Inst.C.E., borough engineer and surveyor:—

Troke, G.	...	...	£1,784	2 10
Grounds and Newton	...	...	1,668	11 4
Saunders, W. H., and Co.*	...	...	1,657	5 4

* Accepted.

BOURNEMOUTH.—For wrought-iron fencing and gates for Horseshoe site, Bournemouth. Mr. F. W. Lacy, M.Inst.C.E., borough engineer and surveyor:—

Morton, F., and Co., Ltd.	...	...	£209	11 5
Dorset Iron Foundry Co.	...	...	191	18 6
Hill and Smith	...	...	176	4 0
Bayliss, Jones, and Bayliss	...	...	175	19 0
Taylor and Gardiner (accepted)	...	...	175	11 0

BOURNEMOUTH.—For making up Churchill and Westbourne Park-roads. F. W. Lacey, M.Inst.C.E., borough engineer and surveyor:—

Troke, G.	...	...	£583	0 8
Grounds and Newton	...	...	538	10 10
Saunders, W. H., & Co. (accepted)	...	...	535	10 0

BRISTOL.—For the erection of additions to the Pack Horse Hotel, Lawrence Hill, for the Bristol United Breweries Co., Limited. Messrs. Gingell and Bond, F.R.I.B.A., 51, Corn-street, Bristol, architects:—

Eastabrook and Sons	...	...	£970	0 0
Walters, E.,	...	...	900	0 0
Perkins, J.	...	...	886	0 0
Humphreys, G.	...	...	875	0 0
Love, E.	...	...	845	0 0
Cowlin, W., and Sons	...	...	814	0 0
Clark, E.*	...	...	813	0 0

* Accepted subject to the omission of pitch-pine seating.

BROMSGROVE.—For the erection of a wood and iron building to serve as an infectious disease hospital, for the joint authorities of Bromsgrove, Droitwich, and Redditch. Mr. Gadd, of Bromsgrove, architect:—

For wood and iron building:—				
Weaver, W. (accepted)	...	...	£103	0 0
For roadway and for guttering:—				
Norvell and Son (accepted)	..	...	£45	15 6
For tents:—				
Edgington & Son, London (accepted)			£107	10 0

CAMBERWELL, S.E.—For the erection of a refreshment-house in Myatt's Fields, for the London County Council:—

Jones, E.	...	...	£337	10 0
Thomas and Edge	...	...	316	0 0
Richards, J. J.	...	...	295	3 7
General Builders, Ltd.	...	...	290	0 0
Marchant and Hirst	...	...	280	0 0
Garrett, J., and Son	...	...	254	0 0
Galbraith, R. H.	...	...	244	4 7
Ham, J., and Son	...	...	242	11 2
McArthur, G., and Co. (accepted)	...	...	232	8 8

COVENTRY.—For the supply of wrought-iron unclimbable fencing, to be erected in Earlsdon-road, for the city council:—
Bayliss, Jones, & Bayliss, Wolverhampton (accepted) ... ... 4s. 6d. per yd.

DAWSHOLM, N.B.—For the extension of the purifier at Dawsholm Gasworks:—
Excavations, concrete, brickwork, and masonry:—
Paterson, J., and Son, Glasgow (accepted).
Ironwork:—
Barrowfield Ironworks Co. (accepted).

ENFIELD.—For erection of six houses at Little Park, Enfield. Mr. John B. Thorp, architect:—

Newman, E. W., Ponder's End	...	£5,450	0	0
Patman, L. and W. H., Enfield	..	5,400	0	0
Houghton, E., & Son, Stroud Green		5,247	0	0

FRINTON-ON-SEA, ESSEX.—For the erection of a school for 150 children, for the School Board. Mr. Samuel T. T. James, M.S.A., Frinton, and 10, St. Mary-axe, E.C., architect. Quantities by Messrs. Kemp, Welch, and Thomas, Bournemouth:—

McKay, Clacton	...	...	£1,795	0 0
Belham and Co., Clacton	...	...	1,775	0 0
Myall and Ellis, Clacton	...	...	1,760	0 0
Gladwell, T. W., Walton-on-Naze			1,574	0 0
Conham, T., Weeley	...	...	1,558	0 0
Dixon, J. W., Clacton and London			1,537	0 0
West, E., Chelmsford	...	...	1,500	0 0
Shillitoe, J., and Son, Bury St. Edmund's	...	...	1,490	0 0
Pitcher, T. B., Walton-on-Naze	...		1,450	0 0
Linzell, H. J., Frinton*	...	...	1,447	0 0

*Accepted subject to the consent of Education Department.

HAMPSTEAD, N.W.—For enlarging the fire-brigade station at Hampstead, for the London County Council:—

Yerbury, R. A., and Sons	...	...	£5,243	0 0
Try, J. N.	...	...	5,109	10 7
Whiteley, W.	...	...	4,986	11 7
Gough, F., and Co. (accepted)		...	4,851	0 0

HELMSLEY.—For carrying out a scheme of water for Stonegrave, for the Helmsley rural district council:—

Bell (accepted)	...	...	£2,593	6 8

(*Continued on page XVI.*)

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2252.
FRIDAY, MARCH 4, 1898.

DISCOVERING TALENT IN ART.

IS architectural ability a thing to be proud of? Or is it merely a dead weight—something to be appended to the qualifications that go to make up successful business men, surveyors, and estate agents? If the latter, then we can quite understand the remarks of our correspondents—"An Art Worker" and Mr. Wm. Woodward—in our last issue, on the bestowal of the Gold Medal at the Institute. One cannot wonder at the secession from that body some years ago of men who were bold enough to put their creed into the form of a memorial—acknowledged leaders of design, like those named by our correspondents. These memorialists had the courage of their convictions by protesting against the mere professional cliqueism which so weighs down and obscures the talent and natural taste of men who ought to be the leaders in their profession. Their names would be invidious to mention. At all events, we have our Bodleys, our Bentleys, our Norman Shaws, our Jacksons, Champneys, Aston Webbs, our Hares, Wades, Austins, and many more whose works assure us of their artistic merit, and of their thorough appreciation of the difference which separates mere professional architecture from the real thing. Although the two things are as different as they can possibly be, yet we find the Institute — aye, and other professional societies—countenancing only those who have a particular way of pushing themselves into notice and who have obtained some success without in the slightest degree exercising the control which is expected from them in the interest of the art they pretend to represent. The man who can talk the most and the fastest, or the successful city practitioner, whose hands are full of fat commissions, valuations, arbitrations, and the like, pushes his way into the front rank, and enters the charmed circle, and by so doing excludes the real men of art. But we shall be told it will always be so in a world where the means and methods of gauging men's acquirements are so imperfect. No doubt! Still, there is no reason why a body of professional men should not have some better means of discovering the real latent talent, as it may be like the hidden treasure, or obscured by circumstances. If they cannot do so, what are our examinations worth? If in spite of all talent and the hard study of these men to achieve a place in their profession, they still find Mr. Brown and Mr. Jones, who have capital, and are eager for fame, able to get on councils, and be recipients of medals, while their studies have not availed them anything, they may well turn in disgust. And if education and ability cannot effect an entrance or win a commission to men who have proved their knowledge of the rudiments of their profession, how can we expect the natural-born artist to share any better? When we see the highest distinctions are given to men of inferior talents, and for designs of very commonplace merit, as those which are exhibited in the academical schools of the profession, it is fair to inquire what guarantee we have that examinations can be conducted on any surer basis? No! it is impossible under our present conditions for promoting architecture or art that anything can be expected during a man's lifetime. After his death, then, perchance, his talent may be discovered—a satire surely on our present modes of reward.

It is hard to discover talent of the real kind, because, forsooth, it is not looked for. Antecedents, influence, birth, the "accidents" of the individual are the points which the profession look to. We have never yet heard of a committee of inquiry to examine closely into a man's real skill as an artist, or his works as exemplifying his ability—the quality of his art. This is not the way pursued. Rather is it to find the number of his commissions, how many public buildings he has erected, or whether any of them have been opened under royal or auspicious patronage. The architect who has designed and erected a few modest buildings or houses and churches of exceptional merit, whose art is expressed in every plan and in every detail, and whose work is always above the standard of modern tastes, is not the man whose qualifications appear, because these are not the things that are looked for. Nor does the retiring and modest artist reap any benefit. His work is always admired by the few who are competent to pass judgment, but overlooked by the many who prefer the "loud," obtrusive, and bizarre. It is this side of art, as of other things, that obtains popularity. We have few that can or will appreciate the subtle, the hidden, or the refined; these qualities are not popular, and probably never will be, with the masses. So, in estimating a man's title to a reward or a distinction, the number and cost of his buildings will always be esteemed. Whether it be in cathedral restorations, the building of innumerable churches or town-halls, or national monuments, the architect who can show the biggest record is the man of the hour. For indomitable energy and business qualification he deserves the honour. We do not deny it to him; but what we should like to see is some recognition of talent, unostentatious and quiet though it be.

But if the professional bodies cannot discern it, how can we expect the public at large to do so? We cannot wonder at the frequent failure of competitions. The ordinary building committee made up of local tradesmen, or the average owner of estates who wants to build, are unable to discover the really good or honest design; they take the blatant or showy instead, and it is often a case of "casting pearls before swine" to try and open their eyes by sending in better designs than they have power to appreciate. And yet the talented designer can do nothing else than conceive what is able, and clever, and honest. It is quite impossible for him to do anything common or vulgar, and therefore he remains in quiet obscurity till someone comes along his path and discovers his talent. But even then he can design only for the few; his chances of promotion are small indeed. Now and then we come across his work—unobtrusive and sober, but always thoughtful; it may be in a small country house or village church, or piece of decoration. On the other hand, his more popular *confrère* meets with a large demand. His work is showy and "up-to-date," and probably he gets as much as he can possibly do well; but he can employ "ghosts," and depute clerks of works to carry out his buildings without any punctilios of conscience. He is in the "swim," and he does not intend to exalt his art at the cost of his brains or his pocket. Art with him is something to make a living by, not to be lived up to. His policy is undoubtedly more profitable, and he may win a title by it.

The craftsman is another individual who can hardly obtain his just recognition. Those who employ him too often disregard his skill or his artistic feeling. So long as he can turn out his work at a given rate, or by the piece, he is thought to be a profitable workman. His individual effort is neither estimated nor paid for. Men, it has been truly said, "will not do an extraordinary day's work for an ordinary day's pay," and it is absurd to expect any skill for such remuneration. Taking our average building crafts, such as the bricklayer, carpenter, plasterer, and plumber, the reward is in no sense proportional to the quality of work; the consequence is that good workmen are not easily found. Skill in any particular craft is often too scantily recognised by employers or foremen; someone else gets the benefit of any "wrinkle" or improved method of execution, just as a large manufacturing firm often takes the credit of its designer's ability. Hundreds of such instances may be mentioned where individual talent remains concealed, and the capitalist or the plodding workman reaping the reward.

MODEL SPECIFICATIONS.—II.

EXCAVATOR.—PRELIMINARY NOTES.

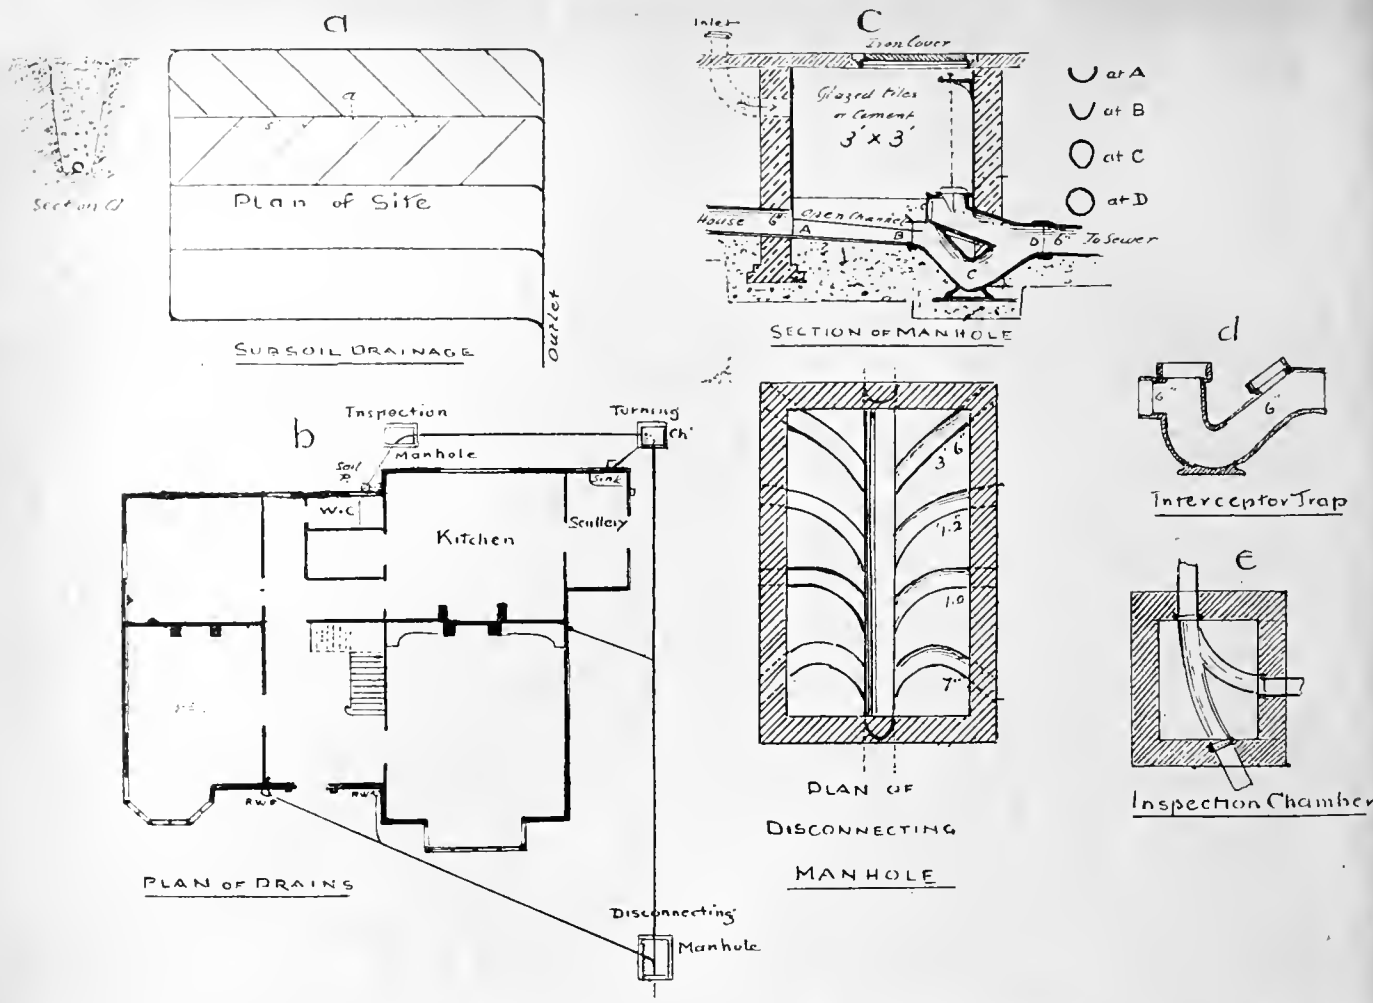
WE propose to take an ordinary building—such as a country villa or town house—and to give examples of clauses under the several trades. And we first deal with the *Excavator*. In excavating trenches for brick footings, it is customary to allow an extra width of 6in. or 8in. on each side at the bottom of trench to enable the men to work. Sometimes the bottom of trench is cut to horizontal benches or steps, to suit the fall or inclination of ground, in which case care must be taken to prevent settlement of the wall at the points where the depth changes, by using thin joints. All angles of building, if high, should be laid with large stones, and the foundations under high portions of the building should be carefully laid to prevent subsidence. Foundations in clay soil should be rather deeper than in gravel or other non-yielding soil, say, 4ft., as clay is liable to crack by heat, especially after much rain.

The architect should also consider if the soil is such in deep trenches as to require planks or poling boards at intervals kept up by struts. In loose ground it is necessary to place the poling boards close, and to support them by planks or "walings" longitudinally, these being strutted between by scantlings. Sometimes in running sands and clays the sides of the trench have to be protected by planks put lengthwise, which is then called "sheeting," this being done at a foot deep at a time; the planks are strutted across as before. (See sketches.)

The width necessary for concrete foundations will depend on the bearing resistance of the ground. A maximum load of 1½ to 2 tons per square foot is usually allowed. If the soil is able to support a load of, say, 2 tons per super. foot, and if stock brickwork in lime mortar will carry 5 tons per super. foot of section, then if we divide 5 tons by 2, we get 2½ as the ratio of width of concrete to thickness of wall. The concrete base for a square pier of brickwork may be found by calculating the weight of pier footings and concrete, and then by dividing it by the safe load on the earth, say 2. Thus, if the pier and footings weigh 50 tons, $\frac{50}{2}$ = 25sq.ft., and the size of square base of concrete will be 5ft.

The full width of the trenches should be filled with concrete. In soft and wet grounds a grill or platform of elm or oak, and, in some cases, of rolled iron joists, is used, on which the footings are built. The spaces are filled up with concrete, and then planked or concreted to receive the footings. In writing specification of concrete in trenches, it is necessary to define the proportions of lime, ballast, sand, and whether the concrete is to be thrown in or rammed in layers. If the depths of excavation or trenches are not shown by the sections, state them, and provide for filling up any holes, cesspools, and grubbing up old foundations.

The By-laws of the London Building Act provide that "no house or building shall be



erected upon any site which shall have been filled up or covered with any material impregnated or mixed with any fæcal, animal, or vegetable matter, or which shall have been filled up or covered with dust or slop or other refuse," or upon which any such matter has been deposited, "unless and until such matter or refuse shall have been properly removed by excavation or otherwise from such site" (see By-law 2, section 16, of Metropolis Man. Amendment Act, 1878). Section 31 of the General Powers Act, 1890, also provides "that any excavation made within a line drawn outside the site of a house, building, or erection, and at a uniform distance therefrom of 3ft., shall not be filled up otherwise than with the natural soil or with brick or dry rubbish or other suitable material approved by the district surveyor," &c.

The following are a few specimens of model clauses which may be selected or modified to suit particular cases :—

1. *Clear Site.*—Cart away all rubbish, and clear the site for setting out building. Or—

Remove the turf carefully, and stack the same for re-use. Or—

Surface Digging.—Dig and cart away all vegetable and surplus earth from site, and wheel and deposit same where directed. Or—

Remove surface-soil to an average depth of 1ft. (or 18in.) over the whole site of building; wheel and deposit the same on terrace or where directed. (State distance to which earth is to be deposited.) Or—

2. *Excavations.*—Excavate for the buildings, areas, yards, &c., to the depths, levels, and inclinations shown, and cart away superfluous earth not required for refilling or improving levels, &c., which must be of hard, dry material. Or—

Excavate for all trenches to the depths shown on the drawings, and to the following widths: for one-brick walls, 2ft. 6in.; for 14in. walls, 3ft. 6in. wide. Level, and ram the earth, &c.

3. *Basement or Cellars.*—Excavate the ground for basement to a depth of 8ft. (or 10ft.) below Datum level, and deposit the earth where directed, or within 20 yards run, and fill in hollow parts or improve levels where required.

Old Buildings and Material.—Shore up and make secure adjoining buildings. Take down old building, clean and stack old bricks and other materials, which the architect may approve as being fit for re-use, and remove all *débris*. Grub up old foundations and drains, and empty and cleanse old cesspools and wells, and fill in with hard, dry material, and well ram.

4. *Underpinning.*—Excavate the ground for underpinning old walls, and deposit earth where directed. Shore up walls and floors of adjoining buildings. Provide all necessary needles and strutting. The excavation to be made in short lengths—say, about 4ft. at a time.

Excavation in Loose Ground, &c.—In loose ground timbering and shoring are required, and a clause may be introduced of this kind :—

5. The sides of all excavations and trenches to be secured by sbores, sheeting, plankings, or walings, strutted across. Provide all pumping, and keep excavations clear of water. Or in—

6. *Quicksand.*—Pile round the area to be excavated, and dig down to solid bottom and fill up with cement concrete to level of footings. (State area and depth of excavation.)

7. Well ram the bottom of all trenches for foundations. The contractor is to report to the architect when the excavations and trenches are ready to receive the concrete or footings, so that the architect may inspect the same, and order, if necessary, any further excavation.

8. *Concrete in Trenches.*—The concrete to be composed of 1 part of fresh ground Dorking (Halling or Maidstone) stone lime and 5 parts of clean ballast, and 1 of sand, thrown into trenches, and will rammed in layers. Or—

To be composed of freshly-burnt ground blue lias lime from Barrow (Whitby, or Aberthaw).

9. *Portland Cement.*—The cement to be from an approved manufacturer, and weigh not less than 110lb per striked bushel, and be subjected to the usual test of sifting and crushing. The ballast to be clean pit or river, of approved size and quality, with a proportion of sharp sand. Or—

The cement to be Portland, from the Thames or Medway, fiuely ground and weighing not less than 112lb. per bushel striked, or more than 120lb., and when shaken through a sieve of 2,500 mesbes to tbe square inch, shall not reject more than 15 per cent, and be of the tensile strength of 350lb. per square foot after seven days' immersion. The cement to be laid in a dry place not more than 18in. deep some three weeks before using, and well turned over before use. Or—

10. *Cement Concrete.*—To be of Portland cement one part to 7 parts of Thames ballast and broken brick or stone. Or—

One part of blue lias stone lime, one part of sand, and six parts of ballast, broken stone or brick. Or—

Cement concrete to be composed of 5 parts of ballast, 2 of sand, and 1 of Portland cement, measured in boxes, mixed dry, turned over three or four times, then water added and turned over again until the whole is incorporated.

(Other proportions are sometimes used: these will depend on the nature of the foundations. For those under water, 1 of cement to 4 or 6 of gravel and sand.) One writer gives the following :—

11. *Method of Mixing and Laying Concrete.*—The specified proportions to be mixed on a clean wood floor after careful measurement, and the materials turned over three times in a dry state, and then wetted through a coarse watering rose whilst being turned back the fourth time, and finally turned over once more and immediately deposited on the trenches in layers not exceeding 12in. in depth. Each layer to be well rammed and the top surface swept clean, picked over, and spriukled with water before another layer is deposited. Each layer is to be allowed to set separately.

12. *Concrete on Underpinning.*—The underpinning of walls to be done in short lengths at a time, with hot Portland cement (or grey chalk lime) concrete.

13. *Concrete Under Floors, &c.*—Lay a bed of concrete, as above, 6in. thick under all wood floors; also for all tile and cement pavements.

The L.C.C. By-law 2 provides that the foundations of the walls of every building shall be formed of a bed of good concrete not less than 9in. thick, and projecting at least 4in. on each side of the lowest course of footings. On a gravel site this provision is not enforced. "The concrete is to be composed of clean gravel, broken hard brick, properly burnt ballast, or other hard material to be approved by the district surveyor, well mixed with freshly-burned lime or cement in the proportions of 1 of lime to 6,

and 1 of cement to 8 of the other material." It is also provided that the site of every building shall be covered with a layer of good concrete, at least 6in. thick, and smoothed on the surface.

14. *Subsoil Drainage.*—Trench out ground according to subjoined plan, and lay dry 3in. (or 2in.) diameter earthenware subsoil drains, in 12in. lengths, in parallel lines 15ft. apart; also the lines between them (herring-bone), which diverge in the direction of fall. The depth of trenches (which are regulated by the kind of soil) is to be 3ft. deep, cut as shown, and to a fall, or to follow the inclination of ground. These drains are to discharge into the lower of the surrounding drains inclosing site, or into any natural stream or outfall sewer. A suitable trap to be provided, and a ventilating opening made near it.

(According to a by-law of the Local Government Board, such drain-pipes are not to communicate directly with any sewer or cesspool; but a suitable trap, with ventilating opening as near as possible to trap, is to be provided.)

15. Fill in the trenches over the pipes to a depth of 15in. with fine porous earth; above this the ordinary earth is to be shot on lightly, and afterwards rammed.

If it is necessary to prevent vermin and mice getting into the pipes, insert "Cover all outlets with wire netting or broken glass."

If the drains come under the walls of the building, which should be avoided if possible, we may add to the clause:—Lay the pipes in concrete arched over the drain with openings at intervals for drainage. The clause for subsoil drainage may run thus:—

Trench out the site or ground, and lay where shown on site plan A, 3in. (or 4in.) earthenware agricultural drain-pipes—say 3ft. deep (the depth varying from 2ft. 6in. for tenacious clay, to 4ft. 6in. in depth in loose, gravelly sand) every 15ft. apart, as shown herringbonewise to the outer drain. The inclosing or outer line of drains to be of 9in. socketed pipes and junctions, and to discharge into ditch or sewer with wire netting or an iron grid.

In our next article we shall deal with house drainage—both with reference to country and suburban and town buildings.

THE ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of the Architectural Association was held at 9, Conduit-street, W., on Friday evening, the president, Mr. Hampden W. Pratt, F.R.I.B.A., occupying the chair. Messrs. E. G. G. Box and C. Gilbertson were elected as members. A number of donations to the library were reported by Mr. E. Howley Sim, hon. secretary, and were acknowledged with thanks. On the motion of Mr. G. B. Carvill, hon. sec., a vote of thanks was accorded to Mr. Sidney R. J. Smith, for allowing members to visit, on the previous Saturday, the houses in course of erection from his designs in Park-lane, W. The President announced that the discussion section would hold a meeting on March 9 (Wednesday in next week), when Mr. J. J. Waldram, of the Institute of Junior Engineers, and Mr. Sydney B. Beale would open a debate on the subject of "The Desirability of a Closer Relationship between the Engineer and the Architect."

LEAD WORK: PLAIN AND DECORATIVE.

A lecture on this topic, illustrated by examples and many practical demonstrations of tinning, casting, &c., was delivered by Mr. F. W. Troup, A.R.I.B.A. The author introduced the subject by a quotation from a paper by the late William Burges, A.R.A., published so long ago as December, 1856, in the *Ecclesiologist*, in which that gifted artist and architect discovered the use made of ornamental lead-work by Mediæval architects in France. He also translated some passages from "The Principles of Architecture," by Felibien, published in Paris in 1690, as giving a succinct description of all the crafts as then practised. Passing on to the practical side of the subject, Mr. Troup pointed out the superiority in wear of

CAST OVER MILLED LEAD,

especially when used for roofs over old oak work. They were told, he remarked, by the advocates of cast sheet-lead that it turned to a silvery grey or white in course of time, whereas milled lead always turned black on the surface. Certainly the beautiful patina on the surface of many old roofs of cast sheet-lead went in support of the first part of the theory; but he thought it wanted some further investigation and proof to show that cast sheet-lead under modern conditions—which, of course, included the metal as well as the atmospheric conditions—would also oxidise to a silver grey or white patina. The roofs of St. Paul's Cathedral and the buildings attached to it were, and always have been, covered with cast lead. From these roofs they might therefore be able to judge conclusively, as there was a constant repairing being carried out in which freshly cast lead was used. But he gathered from Mr. F. C. Penrose and his plumber some years ago, that the stock of old lead was adhered to and simply recast, and in the stock the lecturer distinctly remembered seeing piled up in the crypts fragments of very old lead waterpipes, and even several examples of Roman pipes. In this connection Mr. G. E. Crickmay, of Weymouth, recently found, when restoring Nethbury Church, Dorset, that a cast-lead roof which had been on for a hundred years, was perfectly sound; but that a portion of the roof which was covered with 7lb. milled-lead only 24 years ago, was eaten full of holes, owing to oxidation from the oak underneath. As soon, however, as one came to ornamental lead-work there was no longer any question as to whether cast or milled lead was best. With the latter one was confined to bossing, whereas in casting a sheet it was not only possible, but very easy, to imprint patterns or letters or ornament in the sand bed, and it was still possible to boss or beat up the cast sheet to what extent one pleased after the casting was complete. Turning and engraving could be done equally well on either kind of lead; but in the cast sheet all work, however wrought, gained by the superior texture of the ground surface. There was, again, a great difference in the metals themselves—between old and modern lead. The chief difference consisted in the greater purity of modern lead. Silver was frequently found in conjunction with lead ores, and formerly this was but partially extracted. By modern perfected methods it was profitable to extract the silver if the lead contained only a few ounces to the ton. Whether this absence of silver in modern pure lead had any effect upon the colour to which the surface oxidised or "weathered," as some have held, he was unable to say; but he thought there was no question that the

OLD LEAD WAS HARDER

and more self-supporting in exposed positions, from its slight admixture of silver and traces of other metals (tin, iron, copper, and sometimes antimony and manganese), alloys being nearly always harder than the principal metal in the composition. In this connection it was interesting to note Burges's remarks upon window leads (from the paper referred to already):—"Now, the lead for this purpose was cast, not milled; it was also much narrower than the modern, but contained, if anything, more metal. The consequences are that much of it is good up to the present time, while our flat, broad-milled window lead having its grain broken by the milling, and presenting a very thin and very broad surface to the air, becomes rapidly deteriorated. At Beauvais I saw some lead, which was probably put up at the end of last century, quite in a state of oxidation, and at Tournay, where the whole immense windows of the choir have been filled with stained glass, at no very distant period a very large expense will have to be undergone to fresh lead the whole, as nothing better than the common cottage window lead has been employed." Let them note that thin lead soon oxidised and absolutely perished altogether. This might seem strange when they remembered how everlasting lead sometimes seemed to be. The reason was very simple, and should not be overlooked. A fresh, clean surface of lead tarnished very rapidly when exposed to the atmosphere, owing to the formation of a thin, closely-adhering film of oxide. This film protected the metal from further change, excepting that itself in course of many years became (in the case of cast lead) a fine patina of appreciable thickness. Where the lead itself was of considerable thickness, the loss of strength from this oxidation of the surface was inappreciable, but when the lead was rolled out so thin that the film of oxidised metal bore a considerable proportion to the whole thickness of the metal, it was no longer able to serve its purpose, and tore or dropped away as strain or wear and tear came upon it. Mr. Troup continued: Now a word as to the

LAYING AND WORKING OF LEAD.

Whether milled or cast, it matters not; there is room for much improvement on modern methods. You have only to look at the exhibits sent in by the students of the Polytechnic schools for the prizes to see that the ideal aimed at is all wrong. The results are often wonderful and extremely praiseworthy if only they were of any use. But the working of the lead as at present taught seems to me to be labour misapplied. What practical value is to be had from a three-branched soil-pipe beaten out of one single sheet of milled lead? The dexterity and patience required to do such work is astounding; but it serves no practical purpose. Mechanical precision in lead-work is not only wrong from its being labour misapplied; but it renders the life of the metal shorter, its cost greater, often prohibitive, and certainly does no good to the woodwork it covers. Plumbers with their 5lb. or 6lb. milled lead nowadays often beat and dress the lead over the wood like a coat of paint. The result is that frequently the lead cannot expand and contract freely, as it ought, to prevent tearing and buckling; and the wood under—well, the closer you cover wood the more chance of dry-rot, and if there is any acid remaining in the wood, the more certain is it to attack the under side of the lead. What I should like to see would be a closer following after old methods, which are invariably simpler and more straightforward. My friend Mr. Dodds used to say, he admired the old gutters which seemed to be laid by cutting out a piece of lead the right shape and walking over it once or twice on your stocking soles. That was all. Nothing more is wanted. The young plumber of the present day is taught to dress and fit the sheet hard down into every angle and beat it close over the drip. For all result you get the lead, as often as not, hard fixed at each end, and under a hot sun it must buckle, under a frosty sky it must tear. At each drip the water is drawn up by suction or capillary attraction between the two sheets of lead, and if there be any snow in the gutter, as like as not the water gets up to the woodwork. By the old method all this is left loose and easily fitting, one sheet sliding over the other whether in expansion or contraction. There is no possibility of capillary attraction taking place at the drips or elsewhere, for the lead goes gently rounding over the drip, leaving a clear space between it and the turn-up of the underneath sheet. Nor can I see any special merit in beating things up out of a single sheet of lead when the same object can be attained more directly, more simply, and more rapidly by the help of

SOLDER.

There are limits to everything, and soldering in plumber-work may be overdone; but soldering seems to me to be the legitimate treatment for lead. The joining of two pieces of lead together by soldering is as pre-eminently suitable to the material as welding is for wrought iron, or brazing for copper. Such problems as to beat up a rain-water head from one sheet of milled lead ought not to be set, except as a subject for students' practice—a kind of study in lead-working; and even then it is dangerous, as likely to result in a mere display of manual dexterity and skill, and to develop into such methods of laying and dressing lead as I have described and condemned already. Having referred to the tinning and decoration of lead, the lecturer said, in conclusion: I would recommend those who wish to study the possibilities of the plumber's art historically to avail themselves of Mr. Lethaby's excellent little work, where they will find a most interesting chronicle of the best work to be found in this country in all periods, besides invaluable suggestions and guidance for the worker in lead. I have referred very slightly to ancient examples, although it would be easy to discourse for hours on the multitude of beautiful examples of coffins, fonts, cisterns, pipes and pipe-heads, spires, roofs, ridges, finials, &c., which remain all over this country and abroad. These form an attractive array for any student, and as every town has its examples, at any rate of the later developments of the plumber's art, an interesting study might be made of the varying types in different localities. This, however, is not my object, and I would rather warn you against "cribbing" or reproducing old examples. What I wish to show you is the simplicity of the old methods of work, by what simple ways (almost child's play) they

attained their ends. And, again, from the very ease with which ornament can be applied or wrought on this lead you must not imagine that you have reached the goal when you have covered your material with beautiful ornament.

LEARN THE POSSIBILITIES OF YOUR MATERIAL

before you attempt to design in it. You architects cannot possibly study thoroughly *all* the materials you have to deal with; but it is always possible to study one or two, and the doing so will let in a flood of light upon all the others. This knowledge will make you very modest, indeed, in attempting to design with blacklead, white paper, and a T-square. You have only to try *once* by designing first on paper, and then attempting yourself to carry out that design in actuality to learn what a poisonous and deadly thing it is for a craftsman to have to follow line for line "the architect's design." All freedom is gone; what would have been a quaint twist, or an amusing play of colour or shade, is sacrificed and killed in order to follow absolutely the black and white skeleton on paper. You have only to try it once in any material you like to find the truth of what I say. When once you have learned something about your material, paper-and-pencil is very useful; but you will use it in a mere tentative way, knowing that many things occur to render a slight change a necessity in order to get the best result from what you have in hand; the drawing is but a means to an end.

A vote of thanks to the lecturer was proposed by Mr. W. H. Seth-Smith, and seconded by Mr. Matt Garbutt, and having been supported by Mr. H. Longden, Mr. Arthur Bolton, and the President, was carried by acclamation.

Mr. Troup briefly replied.

ELECTRIC LIGHTING NOTES FOR ARCHITECTS.—XVIII.

By an Assoc. Inst. Elect. Engs.

MEASURING INSTRUMENTS AND TESTING.

THE determination of the electrical quantities, ampèrage and voltage, should be easily and readily made in every electric-light installation: in fact, electrical measurements are as important commercially as the weighing of goods, or the measure of water flowing through a pipe. And as these measurements have to be made so constantly, the instruments used should indicate the strength of the current in ampères, and the pressure in volts, directly, without having to refer to tables, or to make calculations before we can obtain these quantities. When it is remembered that electricity itself cannot be seen and treated as a material substance, it will be obvious that the methods employed in making electrical measurements will be totally different from the ordinary methods of making measurements, as for instance, in measuring lengths, &c. We are, in fact, compelled to take advantage of the *effects* which are produced, and accompany the passage of electricity through conductors to indicate the existence of currents of electricity, and it is by means of these effects that we are able to measure and compare them. It is well known that currents of electricity possess (1) *magnetic*, (2) *thermal*, and (3) *chemical properties*; or, in other words, that currents of electricity:

1. Set up magnetic fields, magnetise pieces of iron and steel, and deflect compass needles.

2. Raise the temperature of the conductor through which they pass; and

3. Decompose compound liquids, and bring from them their constituent elements.

The magnitude of these effects depends upon the strength of the current producing them, and it may be shown that by each of these effects we can determine the strength of the current, and also that the results obtained by the different methods are concordant. In only one case, however, is the effect directly proportional to the current; and, even in that case (the decomposition of liquids by electricity), the method is not applicable for everyday work, because the result is obtained indirectly. To determine the current, we must first determine the amount of decomposition by weighing, and then calculate the strength of the current. It is, however, the method to be adopted in the calibration and standardisation of instruments for measuring currents. In the case of the heating effect, the amount of heat produced by sending a current through a wire is proportional to the square of the current; whilst the magnetic effect is equally dependent upon a constant, and is not directly proportional to the current. In spite of this, however, the magnetic property is the one used almost universally in measuring instruments, and the following notes are intended to give some idea of the principles employed. The instruments that we shall deal with are *ammeters* for measuring currents in

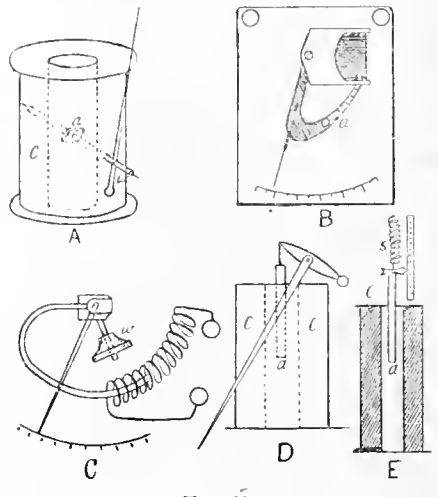


Fig. 61.

ampères, *voltmeters* for measuring electrical pressures in volts, *wattmeters* for measuring electrical power in watts, and *ohmmeters* for measuring resistances in ohms directly. The mechanism of these instruments consists of fixed and movable parts, and the readings are given by means of a light aluminium index-finger or pointer moving over a scale. The movements of this pointer, indicating *ampères*, *volts*, *watts*, or *ohms*, as the case may be, depend upon the movements of an exploring needle, rod of iron, or coil of wire forming the movable part, and it is evident that in all cases the position taken up by such movable part is that of the resultant of two forces—*i.e.* (1) a *controlling force*, tending to keep the pointer in the zero position, and (2) a *deflecting force*, tending to move it from the zero position. There are many ways of producing and arranging these forces, and as most of the instruments in use belong to that class of instrument known as electro-magnetic, the deflecting force is the magnetic field set up by a current passing through a coil or solenoid of wire, forming the fixed part of the instrument. This magnetic field acts either directly on the movable part, or by magnetising pieces of iron placed so as to repel or attract the movable part. And here it may be remarked that the magnetic field inside a solenoid is most uniform and strongest at the centre of the axis of the coil, whilst nearer to the ends the lines of force diverge from the axis, and the field increases in strength as we approach the sides of the coil from the axis. It is thus

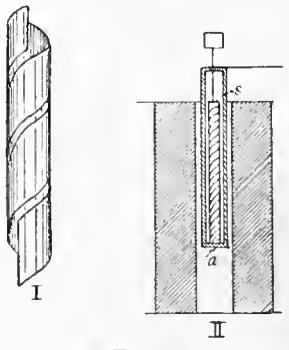

Fig. 62.

evident that a piece of soft iron of the same length as the coil (assumed to be short) has its poles at the ends when a current traverses the coil, and consequently it will take up its position on one side (the strongest part of the field), if free to move; a short piece of soft iron, however, tends to take up its position at the centre and along the axis when a current traverses the coil, if placed at the centre of the coil.

The controlling force, which should be of constant intensity, may be due to permanent or electro-magnets, the force of gravity as by weights, springs, or the tension of a wire; and, as might be expected, many ingenious attempts have been made to dispose the controlling and deflecting forces so as to produce a satisfactory working instrument. The working parts of these instruments are usually inclosed in a circular metal case fastened on to a slate or polished wooden base, to which are also fastened the terminals of the instrument. The usual type is of the clock character, a dial being fixed to the front, over which the index-finger moves across a divided scale marked Ampères, Volts, Watts, or Ohms, as the case may be. In front of the dial and pointer a glass face is fixed to protect the instrument from dust and dirt, and the finger from draughts.

The essential feature of these instruments is that they are *direct-reading*; consequently the measurements will not be so exact as if very delicate galvanometers were used. Galvanometers, however, are only suitable for the measurement of the small currents, and would be out of place altogether for the measurement of the large currents used in electric light and power circuits. They, moreover, are neither direct-reading nor portable: and ammeters are universally used for the measurement of current strength, and the requirements of a good instrument are:—

(1) They should be direct-reading, (2) simple in construction, (3) sensitive, (4) the scale should start at zero and read right up to the limit, (5) the scale should be fairly open, (6) they should not be affected by neighbouring currents or

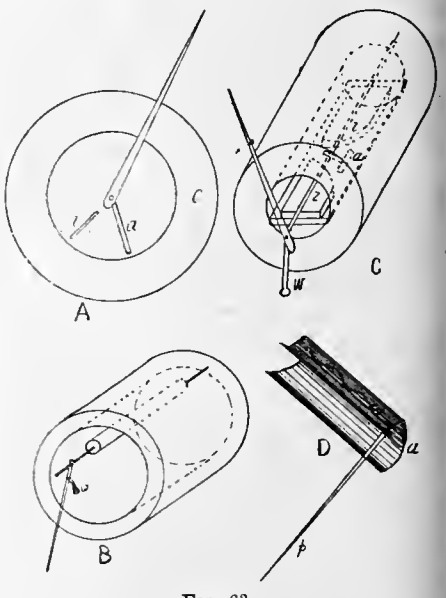

Fig. 63.

magnetic fields, nor by changes of temperature, (7) they should be dead-beat, (8) they should indicate the direction of the current—especially if used on accumulator or arc-light circuits, (9) they should be capable of being fixed vertically or horizontally, and also of withstanding the rolling of ships if used on ships, and (10) they should be cheap. It is also essential that they should not waste energy, or cause a loss of pressure, and since ammeters are traversed by the full current, the coils consist of a few turns of thick wire, so that the resistance is usually very small. Voltmeters, on the other hand, are placed as shunts to the main circuit, and so carry little current, being wound with a large number of turns of fine wire. This is practically the only difference between ammeters and voltmeters of the electro-magnetic type, so that it will only be necessary to deal with main principles.

Ammeters.—The instruments which we shall consider have been chosen and arranged according to the principles they illustrate, rather than from commercial considerations.

The type shown in Fig. 61 consist of solenoids which act on soft iron cores, and the piece of soft iron, being placed in a magnetic field not uniform, is drawn from the weaker to the stronger part of the field.

In this class of instrument the core is magnetised by the magnetic field; but the strength of the temporary magnet is not proportional to

the current, since it depends upon the permeability of the iron, which varies considerably with different field strengths. The readings are therefore not directly proportional to the current, the action being proportional to the product of the strength of the field and the strength of the temporary magnet. In each of the figures, *a* is the soft iron core, *b* the arbor, and *c* the coil.

In Fig. 61, A represents Miller's patent, the controlling force being the force of gravity, a small weight *w* being used for this purpose. B represents a very simple form of gravity ammeter made by the Société des Téléphones de Zurich, in which the core is a peculiarly horseshoe-shaped piece of thin soft sheet iron, the tongue of which is drawn more or less within the coil according to the strength of the current. This tongue is pierced at intervals with holes as shown, by means of which the sensibility of the instrument may be adjusted. The pointer is attached to this core, and the weight of the core and pointer forms the controlling force. C represents a similar instrument introduced by Edison, *w* being a counterweight of such a weight, and so placed as to keep the pointer at zero when the instrument is not in use: D is another gravity intrument, and illustrates the principle of the instruments introduced by Lord Kelvin and Dolivo Dobrowolsky. E represent Kohlrausch's instrument, in which a spiral spring, S, forms the controlling force.

Another interesting instrument of the same class, embodying several unique principles, is shown in Fig. 62. It shows the working parts of an ammeter devised by Ayrton and Perry in 1883, in which the movement of a soft iron core —which is a hollow tube—is opposed by a spring, as in Kohlrausch's instrument. "This spring, shown enlarged in Fig. 62t, is made of hard phosphor-bronze, and shaped like a narrow shaving coiled up into a cylinder of smaller diameter, and, unlike an ordinary spiral spring, it has the peculiarity that for a small increase in length along the axis, there is a large rotation of one end of the spring relatively to the other, the angle of rotation being directly proportional to the axial extension, and to the force which is applied to produce this extension." And since this spring is capable of magnifying a linear motion, it is called a magnifying spring, and the instrument a *magnifying spring ammeter*. The spring is placed inside the thin tube of charcoal iron, and is attached to a brass cap fastened to the tube at its lower end, and as this cap terminates in a brass pin, supported and guided at the bottom of the instrument, the tube cannot rotate at the bottom. The tube, however, is free to rotate at the upper end, to which the pointer is attached, and with even a small amount of suction

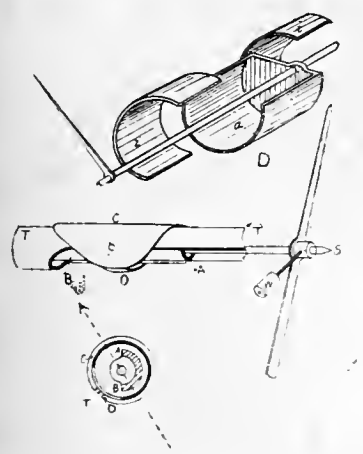

Fig. 61.

(due to a current in the coil) there is a small extension of the spring, and this produces a definite amount of rotation of the tube at the top.

This special form of core was introduced because a thin tube of iron soon becomes magnetised to saturation even in a weak magnetic field, so that when used as the core of an ammeter, as explained, it practically becomes a temporary magnet of constant strength, and the force with which it is sucked into the coil is, for all fields above a certain strength, proportional to the strength of the field, and consequently is proportional to the strength of the current producing the field. The tube is placed with about two-thirds of its length in the coil.

In another form of instrument the magnetic field inside the coil due to a current passing through the coil is modified by the presence of a fixed piece of soft iron. In Edelmann's instruments (see Fig. 63 A) a strip of soft iron, *i*, is fixed near to one side of the coil, whilst the movable core *a* (shown edgeways) is pivoted at

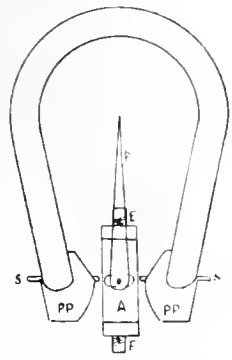

Fig. 65.

one end in the axis of the coil, and is also attached to an index-finger, as shown. The magnetic field due to the current magnetises both strips the same way, and a repellent action is thus set up, with the result that *a* is repelled. In the instrument shown in Fig. 63 B the strip of soft iron *i* is not used, the core *a* being fixed eccentrically within the coil, with its axis parallel to the axis of the coil in such a way that with the assistance of a weight the needle points to zero when the instrument is not in use. When the current passes, the core tends to move into the stronger part of the field (close to the side of the coil), and so moves the index-finger. In the earlier Evershed's instruments (see Fig. 63, C), two small soft iron slabs, *i*, are placed end to end and fixed upon a stout strip of brass, one end of which carries a brass disc which supports the arbor. The two pieces of soft iron are shaped as shown, and are placed so that there is just sufficient room for the movable soft iron core *a* (of short length and fixed to a spindle) to swing freely between them. It is obvious that the field is here intense when a current passes, so that the core *a* tends to move from a weaker field into the stronger, and so moves the index-finger. By shaping the slabs (*i*) on one side the field is stronger on that side than on the other. When not in use the core *a* takes up a position above and outside the gap between the slabs, by means of a counterweight. In Schuckert's instruments (see Fig. 63, D) a light, steel axle, *d*, is pivoted so as to lie parallel to, but a little to the left of, the axis of the coil. This axle carries a curved piece of soft iron, *i*, the same length as the coil, and at one end a light aluminium pointer, *p*. The core *i* is weighted by means of a piece of wire, *w*, which may be adjusted so that when the instrument is not in use the pointer stands at zero. When a current passes through the coil the core is drawn into the stronger part of the field (towards the side of the coil), and the pointer is deflected. The moving parts of this instrument are extremely light, and weigh not more than $\frac{3}{100}$oz., so that there is very little friction.

It will be well here to refer to a class of instruments which depend upon the tendency of every magnetic circuit to become as short and perfect as possible. This is rendered possible by placing the movable core of soft iron so that it tends to move, so as to close the magnetic system set up by the current. The improved Evershed's instruments (see Fig. 64) are of this type. Within a fixed brass tube, T T (part of which is cut away, as shown, so as to diminish the production of eddy currents when the instrument is used for measuring alternating currents) is pivoted a horizontal brass spindle, S, around which (but inside the tube T T) is attached concentrically the soft-iron core A B, forming a half-cylinder. On the outside of the brass tube is slipped, so as to fit it tightly, a peculiarly-shaped soft-iron collar or sleeve, C D, as shown in the figures. When a current circulates through the coil, the core A B is drawn round magnetically against the controlling force of gravity set up by the weight W. It is obvious that the shape of the sleeve gives more or less free magnetism on one side, and it is to this part that the core is attracted. A similar action is utilised in Hartmann and Braun's instruments, the working parts of which are shown in Fig. 64 D.

Many of the earlier instruments made use of permanent magnets to form the controlling force, and it is obvious that in such cases the needle could consist of a small permanent magnet or magnetic needle or a small piece of soft iron. The deflecting force, as in the examples already considered, was due to the magnetic field set up by a current passing through a coil. The needle was pivoted, and attached to it a pointer to indicate the movements of the needle. Many such instruments have been made, but we need only consider the one presented in Fig. 65, which shows Ayrton and Perry's permanent magnet ammeter. In this case the needle is a small piece of soft iron shaped like a flat ellipsoid, and it is placed between the poles of a permanent magnet. The coils of wire are wound on the two halves of a flat brass tube, A, so that the magnetic field set up by the current is at right angles to the field between the pole-pieces. Consequently, when a current traverses the coils the needle takes up a position coinciding with the resultant of the two fields, and the pointer is deflected. Many interesting additions have been made to the original instrument so as to improve the sensibility of the instrument and the controlling force. Pole-pieces of soft iron and of various shapes were added, as shown at P P in the figure; in addition to which two soft iron cores (F F in the figure) were screwed into the ends of the brass tube (on which the coils were wound), so that the deflecting force could be varied by screwing these cores in more or less as required. Later still soft iron screws, S S, were added to the pole-pieces P P, so that their ends form the magnetic tips of the pole-pieces, the distance between which could be varied at will. This type of instrument possesses the advantage of indicating the direction of the current.

No account of measuring instruments would be complete without some reference to Weston's instruments, which have been much used in America, and are now being introduced into this country on account of their sensitiveness and reliability. The working parts of one of these instruments is shown in Fig. 66, from which it will be noticed that strong permanent magnets *m*, carrying two enlarged pole-pieces, embrace a coil of wire *o*, wound on a light aluminium former, and delicately pivoted upon jewel bearings. Inside the coil of wire there is fixed a soft iron core, *p*. When a current passes it tends to turn the coil as in a motor, so that the coil may inclose as many lines of force as possible. This tendency to turn is opposed by a graduated counterforce consisting of two flat spiral hair-springs, *q*, *q*, which also serve to lead the electricity in and out of the coil, these springs being fastened at the top and bottom to the coil. We may add that the

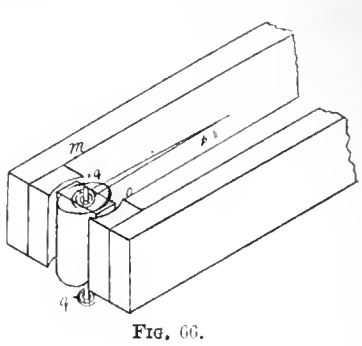

Fig. 66.

gap between the pole-pieces and iron cylindrical core in one instrument is ·01in., the radial thickness of the coil, including the aluminium frame, is ·015in., leaving a clearance of ·0125in. on each side. These instruments are very dead-beat.

(To be continued.)

CEMENT ADMIXTURES.

FOR the past three years investigations into this matter have been made by the Cement Trade Section of the London Chamber of Commerce. They instructed Messrs. Stanger and Blount, of Broadway, Westminster, to make extensive experiments with mixtures of Kentish ragstone and Portland cement, and also obtained valuable evidence from Mr. D. B. Butler, Mr. Gilbert Redgrave, Mr. H. K. Bamber, and

Dr. Michaelis, of Berlin, and others. After full consideration the section adopted the following resolution: "That Portland Cement be defined as a mixture of two or more suitable materials intimately and artificially mixed in the requisite proportions, and afterwards properly calcined and ground, to which nothing has been added during or after calcination, excepting that an addition not exceeding 2 per cent. of gypsum is permissible for the purpose of regulating the setting. That the following rule be adopted:—

"That if any material whatever excepting 2 per cent. of gypsum for the purpose of regulating the setting be added to the Portland cement clinker during or after calcination, the article so produced shall not be sold as Portland cement, but under another distinctive name.

"That the members of the Cement Trade Section of the London Chamber of Commerce, together with all manufacturers of Portland cement in Great Britain and Ireland who are not members of that Association, be invited to sign the following declaration of conformity to the above rule in respect to all Portland cement made by them whatever. We, the undesigned, hereby agree to conform and carry out the rule of the Cement Trade Section of the London Chamber of Commerce as set forth in a report made by the Section and adopted at a meeting held on Monday, the 10th of May, 1897:—

"That if any material whatever excepting an amount not exceeding 2 per cent. of gypsum for the purpose of regulating the setting be added to the Portland cement clinker during or after calcination, the article so produced shall not be sold as Portland cement, but under some other distinctive name.

"And we further agree that if at any time any of the parties to this agreement shall by resolution of a majority of those present at a meeting of such parties duly and properly convened in accordance with the practice of the London Chamber of Commerce, such resolution having been duly and properly confirmed by a majority of those present at a subsequent meeting called at not less than fourteen days' notice, be found to have failed to conform to and carry out the said rule, then in such case his or their name or names shall be struck off the list, and notice of the same made public in such manner as shall be resolved." The above resolution was based upon the evidence of various experts, summed up in the following conclusions of Messrs. Stanger and Blount:—"Ragstone is a natural form of calcium carbonate mixed with silicious matter. It is an inert substance incapable of setting when gauged with water." "Ragstone when mixed with Portland cement undergoes no chemical change, and does not combine with cement either in the dry state or when the mixture is gauged with water." "Mixtures of ragstone and cement have a specific gravity lower than that of unmixed cement, and indeed correspond closely in specific gravity with that calculated from the respective specific gravities of the two materials. The specific gravity of normal ragstone may be taken as 2·70, and that of normal cement as 3·15, so that the difference between them is substantial." "Save for minor effects caused by the slight slaking action of moisture commonly present in ordinary ragstone, the part played by ragstone mixed with cement is purely mechanical. The product obtained from the two materials is merely a mechanical mixture, and is in no sense a chemical combination. In our opinion such a mixture cannot correctly be termed Portland cement." "Gypsum added to cement for the purpose of regulating the setting time in quantities not exceeding 2 per cent. of the weight of the cement, has no deleterious influence on the quality of the cement." With respect to other materials, Messrs. Stanger and Blount say that they are unable to give a general opinion as to their influence on cement when mixed with it, and that they would have to report separately as to each after long and careful investigation; and they express a strong opinion in conclusion that whatever be the effect, whether good or bad, of the admixture of any material whatever with Portland cement clinker after calcination, the article so produced cannot legitimately be termed Portland cement. Each of the other experts examined endorsed this view, and the Section approve and adopt it. At a meeting of the Society of Chemical Industry, held on November 1, 1897, a paper was read by Messrs. Stanger and Blount upon these subjects, when, after alluding to the investigations made for the section as to ragstone, they make the following remarks, for the reproduction of which the Chamber is indebted to the courtesy of the society and of Messrs. Stanger and Blount:—"Ragstone is not a cementitious substance, and its addition to cement is an adulteration. Perfectly sound cement is weakened by the addition of ragstone. This weakening is not fully proportional to the percentage of ragstone added, because the latter acts as a fine filling material and fills up the interstices naturally present in set cement. Cement which is not perfectly sound may be temporarily improved by the addition of ragstone. When the cement has become sound by aëration this improvement disappears. Many minor points were examined and determined in the course of the main investigation, but the most important results are embodied in the conclusions given above. *Additions to Cement other than Ragstone.*—One of these which particularly came within our purview in the course of our investigation for the London Chamber of Commerce is gypsum. Gypsum is largely used in Germany, and to a considerable extent in this country, in quantities not exceeding 2 per cent., and usually smaller than this, in order to lengthen the setting time of the cement. Regarding cement as a chemically finished product in the state in which it comes from the kilns, needing nothing but mechanical comminution to make it saleable, the addition of any substance to the finished clinker must be considered in strictness an adulteration. Thus gypsum becomes under this definition an adulterant. Nevertheless, it is added for a distinct and useful purpose, and in quantities smaller than 2 per cent. does not affect the cement injuriously, so far as our experiments indicate. The last and worst adulterant with which it is our purpose to deal is blast-furnace slag. As far as our experience goes, this most objectionable addition to Portland cement is not employed on the Thames and Medway, but in certain other districts it is used in large quantities for the preparation of a grossly sophisticated product which is fraudulently sold as Portland cement. We must not be understood as condemning true slag cement, made by mixing granulated blast-furnace slag with slaked lime, and sold under its proper title. This material is a perfectly legitimate product, and has its own uses: no one can reasonably object to its utilisation if it is not covertly substituted for Portland cement. But the addition of blast-furnace slag to Portland cement is another matter altogether. The general practice of the manufacturers who seek to increase their profits by the use of slag appears to be to add to the clinker, as it goes to the crushers, as much crude blast-furnace slag as they consider can be mixed with Portland cement without risk of detection by the ordinary consumer, who buys cement in quantities so small that the cost of its analysis is too great for him to pay. The quantity added may be as much as 30 or 40 per cent., and detection is not easy or even always possible for an unskilled observer. Apart from the fraudulent character of this addition, about which no doubt can well be entertained, there arises the question of its effect on the cement. And here it is necessary to make a small digression into the chemistry of the subject." After stating their objections to the use of slag from the chemical point of view, Messrs. Stanger and Blonnt conclude their paper as follows:—"All materials added to Portland cement after the clinker comes from the kilns are adulterants, with the exception of gypsum, which is a recognised addition for a specific purpose in quantities not exceeding 2 per cent. Of the two adulterants which have been specially dealt with—viz., ragstone and blast-furnace slag—the latter is by far the more objectionable, and it should be condemned and rejected by makers and users alike. In this view we believe we are supported by the great majority of engineers and manufacturers."—By order of the Cement Trade Section. Publication committee: Charles Charleton, chairman of section (I. C. Johnson and Co., Ltd.); Leedham White, chairman of special admixtures committee (J. B. White and Brothers, Ltd.); William Porter (Burham Brick, Lime, and Cement Co., Ltd.). Kenric B. Murray, Secretary London Chamber of Commerce.

The following firms have signed the declaration:—Arlesey Lime and Portland Cement Co., Ltd., Arlesey, Beds; William Ashby and Son, Ltd., London; F. C. Barron and Co., London; Booth and Co., Ltd., London; Borstal Manor Cement Co., Ltd., Borstal, Rochester; Burham Brick, Lime, and Cement Co., Ltd., London; Clitheroe Portland Cement Co., Ltd., Clitheroe, Lancs.; Dartford Portland Cement Co., Ltd., London; Dix, Green and Co., Saffron Walden; G. and T. Earle, Ltd., Hull; Formby's Cement Works, Co., Ltd., London; Francis and Co., Ltd., London; C. Francis, Son, and Co., Ltd, Isle of Wight; Gibbs and Co., Ltd., London; Globe Portland Cement and Whiting Co., Ltd., London; Hilton, Anderson, Brookes, and Co., Ltd., London; Hooper and Co., Southampton; I. C. Johnson and Co., Ltd., London and Newcastle-on-Tyne; Laurence and Wimble, London; W. Lee, Son, and Co., London; London Portland Cement Co., Ltd., London; McLean, Levett, and Co., Ltd., London; Martin, Earle, and Co., Ltd., London; New Rainham Portland Cement Co., Ltd., London; John Pattrick and Son, Dovercourt, Essex; Peters Brothers, London; Phœnix Portland Cement Co., Ltd., London; Hon. Ashley Ponsonby, Artillery Cement Works, London; Addison Potter and Son, Newcastle-on-Tyne; Queenborough Cement Co. (Jaffray and Castle), London; A. and W. T. Richardson, London; Robins and Co., Ltd., London; Rugby and Newbold Cement Co, Ltd., Rugby; Walter Scott, Ltd., Newcastle-on-Tyne; Skelsey's Adamant Co., Ltd., Hull; South Wales Portland Cement and Lime Co., Ltd., Penarth, near Cardiff; W. Tingey and Son, London; Tower Portland Cement Co., Ltd, London; Trechmann, Weekes, and Co., Ltd., London and West Hartlepool; Tunnel Portland Cement Co., Ltd., London; West Kent Portland Cement Co., Ltd., London; Weston and Co., London; J. B. White and Bros., Ltd., London; Wouldham Cement Co, London.

CHARTERHOUSE SQUARE.

[WITH PHOTOLITHOGRAPHIC ILLUSTRATIONS.]

TO this there are three entrances—Carthusian-street, Charterhouse-lane, and Charterhouse-street. In each of the first two there once stood a gatehouse, the situation of which is now indicated by an iron gate surmounted by the arms of the hospital. This square is supposed to have been part of the ground first consecrated by Bishop Stratford as a place of burial. The square is inclosed and planted with trees and shrubs; an avenue of limes goes across it, which forms a shady walk in summer for the occupants of the houses around. The trees, considering the part of London they are in, preserve their verdure remarkably well. On the north side, as we enter the square from Carthusian-street, is to be seen the entrance to the hospital. The Gateway is the original portal of the monastery, and possesses many unmistakable indications of antiquity. It is a four-centred or Tudor arch, with dripstone terminating in plain corbels; over all is a shelf supported by two brackets representing lions, grotesquely carved, which may safely be ascribed to the early part of the 16th century. On the right as we enter is the porter's lodge, a modern erection. On the left is the residence of the medical officer of the hospital. Passing on, we find ourselves in the Entrance Court. From this there are two places of egress. A road lies straight before us leading to the quadrangles, the schoolmaster's house, the gown-boys', and the preacher's residence. Another on our left conducts us to the master's lodge, the hall, and the chapel. Under an archway leading to the master's court is the entrance to the Master's Lodge. Having viewed the interior of the master's lodge, we return to the Master's Court. On the left an arched passage leads us to the Washhouse Court, described hereafter. In the centre our attention is drawn to a porch surmounted by the Royal Arms, leading to the great hall and kitchen, whilst a passage on our right conducts us to the Chapel Court. This is surrounded by buildings on the south and west sides, the chapel on the east, and a colonnade or piazza on the north. This is denominated the Chapel Cloister, but it does not merit the name. A row of six heavy inelegant Italian semi-Classic arches on one side is all it possesses: there is nothing to attract the notice, save the extreme clumsiness of form and detail; in style it is almost nondescript. At the east end of this specimen of debased architecture is a door in the same style, leading to the ante-chapel. Entering the Ante-Chapel, a small square chamber, at the east end of which is a modern screen, surmounted by the Royal Arms and those of the founder, Sutton. Through this a most beautiful view may be obtained of the east window. This chapel is vaulted and groined, a rib springing from a corbel in each corner; at the intersection of these ribs are bosses, ornamented with roses and foliage, and shields charged with instruments of the Passion. Here is placed the font. This is of stone and modern, but it is wofully debased. The ante-chapel bears the date 1512, and is in good preservation. At its east end is an equilateral arch leading to the chapel. The mouldings are distinct and good. It is filled up with the carved wooden screen before spoken of. This consists of a series of pointed arches, cinque-foiled, and through it we enter into the Chapel. The plan of this building is most difficult to describe, the present chancel being part of the original nave. It is square, divided in the centre by two

Tuscan pillars; a recess was added to the north side in 1826, and there is a tower at the west end, parallel with the ante-chapel. The south wall alone is part of the original church. It is supposed that the choir extended some way to the east beyond the present chapel. The pillars which divide it in the centre support three semicircular arches, the keystones of which are embellished with the Charterhouse arms. The roof is flat, ceiled and decorated, after the style of the time of James I. At the west end, under the tower, is an open screen of wood, carved in a style corresponding with the date of the rest of the chapel. This supports a gallery containing the organ. Its principal ornaments are grotesque, puffy-faced cherubim, helmets and swords, drums and instruments of music, and in the centre is a shield, tied up with a thick cable, charged with the arms of the Hospital. The altar is of wood, and on each side in the corner of the chancel is a sort of stall, the one on the right being appropriated to the head, and that on the left to the second master of the school. The east window is of five lights under one arch, and is filled with painted glass. The pulpit and reading-desk are against the south wall, as also are the masters' and preachers' pews. The seats for the pensioners are open, and have poppy-heads in the shape of greyhounds' heads couped, ermine collared gules, garnished and ringed or, on the collar three annulets of the last, the crest of the hospital. The scholars sit in the recess to the north. The founder's tomb is on the north side of the chancel. In leaving the chapel by way of the cloister, our attention is drawn to a small door on the right; this communicates with a spiral staircase leading to the roof of the tower. The tower is square, and is surmounted by a heavy Italian parapet, with a thing in the shape of a pinnacle at each angle. The whole is crowned with a wooden dome resting on pillars supporting semicircular arches. Returning by the cloister we stop at a door on the right which conducts us to Brooke Hall. This room is now used as a dining-room for the officers of the house, where they meet daily and occasionally introduce a friend to participate in the bounty of Sutton. Retracing our steps along the cloister we enter a small paved hall, and to our right we spy the foot of the Great Staircase. This is magnificently carved with Arabesque ornaments, of somewhat the same character as those on the gallery of the great hall. It is 6ft. wide, and consists of 21 steps. Midway there is a large window looking in the Master's Court. Arriving at the top, we see on our right the entrance to the apartments of the Reader, on our left an antechamber conducts us either to The Terrace, a fine paved walk of nearly 80 yards, commanding a view of the green, or to The Library, which we enter through a door on our left. This contains a valuable collection of erudite and scarce works. Adjoining is the Governor's Room, the decorations of which date about the time of Elizabeth, and are of the most magnificent description. The ceiling is flat, and is adorned with the armorial distinctions of Thomas Duke of Norfolk. Retracing our steps down the great staircase, we come to the Great Hall. This is the most ancient of the buildings which date subsequent to the Reformation, the west wall being part of the conventual edifice. It was most probably built by Sir Edward North, who obtained the Charterhouse for his private residence in 1535. At the west end is a spacious music-gallery, which, from the style of carving, as well as the letters "T. N." and the date 1571, appears to belong to the period when the unfortunate Duke of Norfolk was a prisoner in his own house. This communicates with a smaller gallery at the side of the room which was used as a passage from the great staircase to other parts of the house, and is of the same antiquity as the hall. The roof is plastered, panelled with wood, and arched in the centre. The room is lighted by three large windows, which have four centred arches, and four smaller square-headed ones. They consist of five lights, transomed and super-mullioned. One is sunk in a recess, with panel-work, sculpture descending to the ground. The chimneypiece was an addition by Sutton, and is of later date than any other part of the building. It is carved in stone, but is of grotesque design, consisting of imaginary scrolls, in the style of the Renaissance school. The arms of the founder, surmounted by helmet, are well executed, as also are two small pieces of ordnance on each side, which are boldly, yet accurately, wrought. Beneath these, and in the centre above the space allotted to the stove, is an oval upon which is carved a dragon, but it is now much mutilated. This room is now used as a dining-hall for the pensioners. A door on the right opens into the Upper Hall, which is a small low room, devoid of all ornament except the chimneypiece, which is carved in stone, and has the founder's arms sculptured above. The windows are square-headed. It is now used as a dining-hall for the scholars on the foundation. Returning through the great hall, we make our exit through a door under the music gallery, which opens into a stone passage, on the right of which are the apartments of the manciple. On the left, an outlet opens into the master's court, and in the centre are three doorways of depressed Tudor arches within a square head, the spandrels being filled with roses, foliage, and angels bearing shields. These lead to the Great Kitchen, which gives the stranger some idea of the immense consumption of the house. Retracing our steps through the master's court and entrance court, we direct our course to the gown-boys and green, a road which we avoided on our first setting out. Proceeding, therefore, down this road, we come to another gateway, more ancient than the outer one, but which possesses no ornamental attractions. A doorway on the right opens into the Abbot's Court. Of all the courts this is the most ancient. It is sometimes called Wash-house Court. Returning, we enter the Preacher's Court. This is a range of new buildings, castellated and turreted, built in the year 1825, after the designs of Edward Blore. In the centre of the north side is a gateway with an octagonal turret on each side, one of which contains the bell, which sounds regularly every quarter of an hour before the meals of the pensioners. On the west side are apartments for some of them. On the south and east sides is a paved cloister, and at the south-east angle is to be seen the large west window of the governor's room, above which are five shields, excellently carved in stone. The gateway in the centre of the north side has a depressed Tudor arch within a square head, the spandrels of which are filled with shields charged with the Charterhouse arms. The parapet above is embattled. This leads to the Pensioners' Court. This is of the same date as the preceding, but does not boast of the cloistered walk which beautifies it. In the centre of each side is a fine gateway, similar to the one before described as opening into this from the Preacher's Court, but without the two octagonal towers. The one on our left opens into the stable-yard and servants' apartments; that on the north side into the burial ground; and that on our right into a passage which divides it from the schools.

WALTER H. BOURNE.

[We hope to give the general plan and elevations at an early date.—ED.]

DANGEROUS FLOORS.

ACCORDING to the accounts recently published in the Canadian papers on the late disastrous collapse of a crowded floor in London, Ontario, which we noticed in our last issue, the jury empanelled to investigate the circumstances have returned a verdict, "That more than ordinary care was used in the construction and selection of material, and that the said occurrence was purely accidental." This is surely unsatisfactory if we take the facts as they have been reported, to which it is needless again to refer. From what we gather, the public hall was 72ft. long and 42ft. wide, with a platform at one end. The people in the hall appear to have crowded round the platform in a rather excited manner. A portion of the floor in one corner, including the platform, gave way, and precipitated the mass upon the floor below. The load, according to the *Canadian Architect*, was chiefly carried on a beam 21ft. span, and was distributed on an area of flooring about 28ft. by 22ft. The total area of floor bearing on beam was, it is said, 249sq.ft., and the weight of floor itself is estimated at 25lb. per square foot. As to the live load actually bearing on the beam at the time of the accident no exact information is forthcoming, though it is calculated by our contemporary, allowing the weight per person at 135lb., that a total live load of 33,750lb. was over the entire space which gave way, or a live load on the beam of 16,875lb. But the exact condition of the crowd and their movements are not known, and therefore any conclusions from these figures are impossible. For correct calculation it would be necessary to find out how the people were distributed, whether they were merely standing or jumping; how many really were standing over the beam which gave way, and which we are told was 12in. by 14in., composed of four pieces, each 3in. by 14in., spiked together, though not securely. According to Kidder, whose estimate is not high, such a beam, if sound, would carry safely 13,440lb., allowing a factor of safety of 4, and according to the calculation of our contemporary the load on the beam may be taken at 40,350lb., a load which it was incapable of supporting according to the evidence of a witness. We have here the salient points of the case. A beam of the dimensions and construction stated, if properly made, according to the best authorities, should at least have been able to carry without breaking the actual load of floor and people that came upon it, though that load exceeded the factor of safety. But it gave way. We have here another proof of the valuelessness of calculating strength when other conditions are wanting—those, for example, of good material and execution. This beam clearly failed from imperfect material or method of bolting; the wood was seriously weakened by knots, which robbed it of a large percentage of its strength, or the pieces of which it was composed—according to report, four pieces 3in. by 14in. spiked together—were inadequately joined to take their share in the resistance. One witness says the pieces could "move one on another," thus destroying the value of a bolted beam; further, that they were only spiked together instead of being bolted. If these allegations are true, we have here another instance of a beam designed rightly to carry such a load, but rendered incapable of doing so by carelessness of workmanship. It would have been safer to have trusted to a solid timber beam of the same scantling. The incident in its terrible consequences should be a lesson to architects and builders, never to trust to bare calculated strength alone. There are so many other elements to consider in beams—soundness of timber, freedom from knots, perfect bolting together. Then sudden impact, such as jumping or any synchronous movement of a crowd of people, as a tread or a dance, unequally increases the live-load enormously, and one authority puts the effect of jumping at over half per cent. on the still load. Of course, every floor to a public hall ought to be strong enough to be able to resist this severe strain, and to withstand any kind of treatment. So that the architect ought by no means to be satisfied with his calculated results, but allow a full margin for all the above causes of weakness and increase of stress. Nor can we say that the jury did their best to investigate the cause of the catastrophe. To say the fall was due simply to accident, and that more than ordinary care was used in the construction and selection of material, is an extraordinary verdict.

THE OUTLAY ON BROOK HOSPITAL.

AT Saturday's meeting of the Metropolitan Asylums Board the annual financial statement was submitted by Mr. A. C. Scovell, from which it appeared that the total expenditure of the managers for the year ended Michaelmas, 1897, amounted to £665,393—an increase of £40,270 upon that for the previous year. This increase was mainly accounted for by the opening of the Brook Hospital, involving an additional expenditure of £33,000. Upon the presentation of the report of the special committee in the matter of the Brook Hospital expenditure, Mr. James Brown said that his name had that day been mixed up by certain London newspapers with what was said to be a gross scandal in connection with the erection of the Brook Hospital. He had been accused of supplying the bricks which were used in the construction of that hospital, but the charge was devoid of foundation. Mr. Brown explained that he was the maker of a special sort of ornamental brick, which was used by builders all over the country, and that a comparatively small quantity of the bricks which had been supplied by him to merchants in London had been used in the ornamentation of the Brook Hospital. It was, he said, done without his knowledge, and it was a matter over which he had no control. He thought the way in which the matter had been brought up was a gross injustice.

Mr. E. White moved the adoption of the committee's report. In this it was stated that the original estimate for the erection of the Brook Hospital was £194,810, and the amount of the

tenders ultimately accepted £218,171 16s. 2d., whilst the amount which the managers were asked to pay in settlement of the contractors' final claims was £268,507 11s. 2d. The difference between the total amount of the accepted tenders, £210,018 0s. 4s., for which the architect was responsible, and the total amount for which he was prepared to certify in settlement thereof, was £49,383 11s. 8d., of which £10,723 appeared to have been sanctioned by or reported to the Board, leaving the balance to represent the value of work ordered on the architect's individual responsibility over and above the value of the works for which tenders were accepted by the Board. Mr. Aldwinckle, the architect, was blamed by the committee for having under-estimated the amount of work necessary in many cases, and for making no provision in his original estimate for many incidental matters. While he estimated that the cost of extra foundations was about £5,000, the actual value of the measured and certified work amounted to nearly four times that amount.

Mr. J. H. Brass moved, as an amendment to the committee's recommendation, that the contractors' claims as finally adjusted be approved, "That the report be referred back to the committee for them to report as to the cause of extra expenditure, as to the several contractors not executing the work in accordance with their sealed contracts, as to the power of the architect to order additional work without the authority of the Board, and as to whether the certificates of the architect for such work were not *ultra vires*." After some discussion the debate was adjourned.

IRON UPRIGHTS.

THE series of tests made at Hamburg to show the behaviour of uprights for warehouses when subjected to heat or fire are of some value. They point to certain conclusions—namely, (1) that wrought-iron uprights, if not protected, show little resistance at a fire, and may collapse in temperatures exceeding that of 1,100° Fahr.; that (2) wrought-iron uprights, if protected by concrete—as, for instance, by filling in the kernel of the framing—offer a somewhat greater resistance than if entirely unprotected; (3) if these uprights are protected by non-conducting materials they show a much greater power of resistance than cases 1 and 2; (4) that cast-iron columns (unprotected) offer a slightly greater resistance than wrought-iron uprights, the collapse taking place at temperatures above 1,400° Fahr.; (5) cast-iron columns require considerable attention as regards section and maximum load when used in dangerous buildings, as the time of collapse differs very materially, according to weight during a fire and their plan; (6) if protected with non-conducting materials, cast-iron columns show a greater resistance than wrought-iron uprights so protected; (7) wooden uprights, if unprotected, catch fire at a temperature under 1,100° Fahr.; but, though well alight, show greater resistance than unprotected wrought-iron or cast-iron uprights; (8) all these kinds of uprights in no case give any sign of impending collapse.

These conclusions are instructive. Nos. 3 and 7 are very important. The value of protection is established, but particularly that afforded by "non-conducting materials." No. 7 ought to make all architects and engineers think. Wooden supports collapse only at a temperature a very little short at which wrought-iron ones yield if left unprotected. The difference between wrought and cast iron is assumed to be greater than these tests show. Most architects are under the impression that a wrought-iron column is more fire-resisting than cast iron, that it is less likely to crack under fire and water, and this is undoubtedly the case; but they are not prepared to learn that a cast-iron column protected has a much greater resistance than one of wrought iron similarly treated.

A new public hall is about to be built in Fountain-street, Halifax, from plans by Mr. W. C. Williams. It is proposed to provide a hall with a seating capacity of 2,510, and a lesser hall holding 336 persons.

Mr. Howard Martin, the arbitrator in the claim brought by Mr. Gill against the South-Eastern Railway Company, for the value of the property known as 34 and 36, Dockley-road, Bermondsey, taken under compulsory powers, has issued his award at £1,065. The expert valuations handed in on behalf of the claimant ranged from £1,676 to £1,775 10s.; those for the railway company from £824 3s. to £914.

BOOKS RECEIVED.

Sewer Gas, and its Influence upon Health, by H. Alfred Roechling, C.E., Assoc.M.Inst.C.E., &c. (London: Biggs and Co., Salisbury-court, Fleet-street), is an exhaustive treatise on the subject dealing with several aspects instead of only one or two points. The author, in fact, investigates the subject from several standpoints. Chemical research, medical science, bacteriological, and engineering inquiry have been brought to bear. The earlier chapters treat the later developments of the inquiry, the history of sewer gas controversy, the theories of Murchison and of Budd, American and Continental views, the present state of our knowledge, the conservancy methods, and the water carriage system. The author speaks of the sanitary and other advantages of this system over the conservancy methods. An important chapter is that on micro-organisms in sewer air, in which various experiments are referred to to ascertain whether germs can be carried away by air currents in pipes and sewers. Summarising these, it is held that pathogenic germs meet with conditions in sewers unfavourable to them, such as the myriads of other germs that crowd the sewage, and which struggle for existence; that these micro-organisms cannot rise from liquids and moist surfaces; and that there is a comparative absence of germs from sewer-air. The report of Messrs. Laws and Andrewes is mentioned, to show how difficult it is to catch the typhoid germ, even in sewage from the Homerton Hospital. At a mile below this institution, not a single colony of the bacillus was found in the drainage. The experiments on animals are detailed. These show that 75 to 100 per cent. of all animals inoculated with small doses of attenuated typhoid bacilli, after exposure to sewer-gas, perished, while not one of the animals kept under normal conditions succumbed to the inoculation, proving that putrid gases, including sewer-gas, predisposes animals to the pathogenic action of the germ. The appendices and tables given at the end of the volume are instructive.——*The Cathedral Church of Winchester, &c.*, by Philip W. Sergeant, late scholar of Trinity College, Oxford (London: George Bell and Sons), is another of the useful and admirably got-up series of monographs of our cathedral churches now issuing under the title of "Bell's Cathedral Series," edited by Gleeson White and E. F. Strange, several of which we have noticed. This volume on Winchester has been compiled by Mr. Philip Walsingham Sergeant from authenticated sources, such as Prof. Willis's paper, and is illustrated by numerous sketches and phototypes by The Photochrom Co., Ltd.; S. B. Bolas and Co. have chiefly supplied the negatives. The views of the choir-stalls, and the beautiful altar and carved reredos, lately restored; Beaufort's and Foxe's Chantries, Wykeham's Chantry, Langton's Chapel, and the noble nave of Wykeham, are excellent representations. Other illustrations are from drawings and sketches. An excellent plan of the cathedral and one of the crypts, with references to the chantries and tombs, are given at the end. Brief notices are appended of Winchester College, the Hospital and Church of St. Cross, and other antiquities. The beautiful iron grill from St. Swithin's shrine, from Mr. Starkie Gardener's book, lent by the Science and Art Department, is one of the illustrations. The descriptive matter is as far as possible correct and concise, and the book published at the low price of 1s. 6d., will be found an invaluable handbook to the general reader and tourist. Much valuable information respecting the history and structure of this fine example of Mediæval architecture in its earlier and later phases is condensed in Mr. Sergeant's book. The series will entirely supplant the poor and meagre guide books of our great cathedral establishments.——*The Cathedral Church of Lichfield*, by A. B. Clifton, is another of the series. The author in this history has been less fortunate in the choice of his authorities. There are fewer reputed authorities to consult, but a number of journals and pamphlets have been put under contribution. The result is, however, satisfactory. For the general reader or student the information is all that he can desire; the photographs from the same firm as we noticed above have been reproduced, and make clear and crisp pictures. As Mr. Clifton says, while other cathedrals are larger or grander, Lichfield is more charming and jewel-like. Every detail in it is beautiful. Take a bay of the nave: what can be more perfect or refined in the Middle Gothic or Decorative period, or a bay of the choir with its beautiful traceried window and mouldings? Take the fine clustered pillars and capitals in the choir, or the side doorways of west front with their beautiful foliated tracery over, or the grand central one with its cusping and carved arch members and sculptured jambs—all of the same perfect 14th or 15th-century richness. The tourist and student cannot provide themselves with a better manual.——*Sell's Dictionary of the World's Press and Annual of Useful Knowledge for* 1898, is still further enlarged, although, for the purpose of gaining space, the whole of the lists of papers, &c., have been reset. Particulars of every newspaper published throughout her Majesty's dominions are given, together with the principal foreign papers. Many articles of great importance to commercial men generally (other than editors, &c., who are more particularly interested in the newspaper world) will be found.——*Laxton's Builders' Price Book for* 1898 still maintains the honourable position it has so long enjoyed among architects, surveyors, builders, and contractors. Great care has been exercised in the preparation of the work so as to bring the prices and other information up to date, based upon the latest quotations of the price of materials, and throughout the compilation thereof the aim has been to make it as accurate and complete as possible. Important decisions under the New London Building Act, 1894, in the superior Courts and the Tribunal of Appeal are stated in detail, and "heads of cases" brought before the police-courts under the same Act are also given.

CHIPS.

The Leicester Town Council have by an almost unanimous vote, decided to exercise the right they have obtained under their new local Act by erecting a crematorium in their new cemetery at Silroes.

Great progress has been made with the erection of the new ironworks for Messrs. Lysaght and Co., of Bristol and Wolverhampton, on the east side of the River Usk at Newport, Mon. Three large buildings have been erected, and three boilers have been laid down. A number of annealing furnaces are now in working order, and a preliminary trial of a 500H.P. engine for working three rolling mills was made on Friday. The plates will be sent to Bristol to be galvanised. The Great Western Railway Company are laying a siding to the works from the new East Usk Railway.

The shareholders of the Maidstone Water Company, at the private meeting held on Thursday in last week, approved a draft agreement for the sale of their undertaking to the corporation of Maidstone. The directors were also empowered to proceed with a scheme for forming an auxiliary company or syndicate for obtaining a further supply of water.

At the recent session of the Legislature of the Province of Quebec a Bill, No. 87, was passed, making several amendments to the Act of Incorporation of the Province of Quebec Association of Architects, chief among which is one which restricts the use of the title "Architect" to persons who shall register under the Act. The amending measure has now received the assent.

On Saturday the members of the Edinburgh branch of the Amalgamated Society of Carpenters and Joiners paid a visit of inspection to the M'Ewan Hall. Including a few lady friends, nearly 300 availed themselves of the opportunity of seeing the great building, and Mr. Allan E. Clark, the clerk of works, carried out the arrangements. Mr. Clark gave some particulars regarding the construction of the hall, its dimensions, and architectural features. He further described the art-work and the organ. Thereafter the sightseers walked round the building, when all explanations were afforded by Mr. Clark, the engineer, and others.

The Leeds Sanitary Committee have recommended the council to accept tenders for lighting and heating the hospital pavilions at Manston. The tenders amount to between £3,000 and £4,000.

On Thursday week, the city council of Chichester elected Mr. James Saunders, A.R.I.B.A., assistant borough engineer of Oldham, to the post of city surveyor and waterworks engineer. There were 115 applicants for the appointment.

The extensions to the hospital, Lowestoft, are being warmed and ventilated by means of Shorland's patent Manchester stoves, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The memorial stone of a new Baptist chapel, to be built on the Grove Estate at Lowestoft, was laid last week. The tender of Mr. J. Ashley, of Lowestoft, has been accepted at £3,540 for the new building, which will be seated for 700 persons.

OBITUARY.

Mr. Edward J. Purnell, Jun., architect and surveyor in the Coventry district, died on Sunday from consumption. The deceased designed many of the new cycle factories and the extensions at former factories in the city, and had several important works in hand at the time of his death. He was surveyor to the Kenilworth Highway Board, and manager to the Kenilworth waterworks.

The death is announced of Mr. James Freret, of New Orleans, one of the most distinguished architects of the Southern States. Mr. Fréret was born in that city in 1838, and educated at the Jesuit College, going thence to the School of Fine-Arts in Paris, where he was a fellow student with the late H. H. Richardson, himself a native of Louisiana. At the outbreak of the Civil War, Mr. Fréret returned to New Orleans, and joined the Confederate Army. He was severely wounded at the siege of Fort Hudson, and was taken prisoner, and, though afterwards exchanged, was permanently disabled. At the close of the war he entered upon the practice of his profession, and designed many of the most important buildings in New Orleans, including several churches. He was at one time a prominent candidate for the position of supervising architect of the United States Treasury Department.

We regret to announce the death of the wife of Mr. Ellis Marsland, district surveyor for Camberwell, and the genial and energetic honorary secretary of the Society of Architects. Mrs. Marsland died at their residence, 73, Sydenham Hill, S.E., on Thursday in last week, five days after giving birth to a son. Mr. Marsland's first wife died very suddenly some years since.

Sir William M'Cammond died on Wednesday at his residence, Walton, Fort William Park, Belfast. He was the son of Mr. James M'Cammond, of Ballyduff, county Antrim, and was born in 1831. Since 1840 he had carried on business as a builder and contractor in Belfast, and had risen to the leading position in the trade in that city. He became one of the Water Commissioners for the city in 1877, being chairman from 1882 to 1885, and a member of the City Council in 1880. He filled the office of chairman of the Improvement Committee of the Council from 1884 to 1894, and was Lord Mayor for two successive years from 1893 to 1895, being knighted in the latter year. During the engineers' lock-out of 1895, Sir William was associated with Lord James, and the then Lord Provost of Glasgow, in bringing about a settlement of the dispute.

Mr. Archibald Allan, C.E., burgh surveyor for Govan, died suddenly at his office, Hillock House, on Friday. Mr. Allan attended a Dean of Guild Court at ten o'clock, and he then returned to his office, where he was seized with illness and died shortly after, the cause being cardiac apoplexy. Deceased was a native of Glasgow, and was appointed burgh surveyor of Govan in 1880, and during his connection with the district he prepared plans for most of the large streets, while public halls and burgh buildings are at present being constructed from his plans. He was 46 years of age, and unmarried.

A new organ has just been opened in St. Mark's Church, Saltney, near Chester. It was built by Messrs. H. and H. Whiteley, of Chester and Saltney. The case, which is of oak, was designed by Mr. T. M. Lockwood, F.R.I.B.A., of Chester, and was made by Mr. Freeman, George-street, in that city, under the direction of Mr. W. Patison. The decorations of the front pipes were designed and carried out by Messrs. Ellis, Foregate-street, Chester.

At Paisley on Saturday the statues of the late Mr. Thomas Coats and Sir Peter Coats were formally unveiled. The statues of the brothers are erected on a terrace leading from the High-street into Dann-square, and have been executed by Mr. W. Birnie Rhind, of Edinburgh, whose model was selected in competition. Sir Peter is represented with his frockcoat thrown back by the left hand, the right hand grasping the lapel below the collar, whilst Mr. Thomas is placed in a reposeful attitude, his frockcoat buttoned, and over it his topcoat. The pedestal of the Sir Peter statue is square in outline. There are pillars at the corners, and niches and panels on each of the four sides, and on these are placed symbolic figures representing "Frugality," "Industry," "The Arts," and "Literature." The pedestal of the Thomas Coats statue is of white marble, the angles being rounded off, and the panels, with symbolic figures in bas-relief, represent "Prudence," "Perseverance," and "Liberality."

PROFESSIONAL AND TRADE SOCIETIES.

Aberdeen Society of Architects.—The annual meeting of this society was held on the 1st inst. when the following office bearers were elected:—President, Mr. James Souttar; vice-president, Mr. Arthur Clyne; hon. sec. and treasurer, Mr. John Rust; members of council: Mr. Wm. Kelly, Mr. A. M. Mackenzie, Mr. A. H. L. Mackinnon, Mr. George Watt, Mr. R. G. Wilson.

Electric Lighting for the House.—At a meeting of the architectural section of the Philosophical Society of Glasgow held on Monday, Mr. William Arnot, formerly electrical engineer to the Corporation of Glasgow, read a paper on the distribution of electricity in the house. He said that no one yet knew what electricity really was, but that it could be measured as accurately as any matter by its effects. The units, in which we spoke of the pressure and quantity of electricity, were now well defined, and could be easily determined, thanks to Lord Kelvin, Lord Raleigh, and other eminent scientists. After speaking of the different units, he described the distribution of current by means of the three wires, which is the system now universally adopted. He then went over in detail the different fittings in a house, and the different systems of wiring. He was of opinion that switches should not be spared, as they tended to reduce the annual bill for current. Fuses should also be placed in suitable boxes, and not scattered over the house in inaccessible places, even though the cost was a trifle more under such a system. He thought more taste could be expended on fittings—not so much brass and more light—and that the positions of the lights should tend to decorate a room rather than burden it.

Glasgow Architectural Association.—At the monthly meeting of this body, the president, Mr. W. T. Connor, in the chair, Mr. J. A. Williamson, A.R.I.B.A., as delegate from the Edinburgh Architectural Society, lectured on "The Wren School." The lecturer approached his subject by a prefatory sketch of Wren's great predecessor, Inigo Jones; then, taking up the great master himself, described in a clear and concise manner his most characteristic works, closing with a careful criticism of the productions of Wren's successors, and in particular Gibb, Vanborough, and Hawkesmoor. The lecture was illustrated by limelight views of buildings and original drawings by the architects referred to. At the close a hearty vote of thanks was passed.

Manchester Society of Architects.—At a meeting of this society, held on Tuesday night at the Standard Chambers, Mr. John Ely in the chair, Mr. J. H. Reynolds, director and secretary of the Manchester Municipal and Technical School, read a paper on "Technical School Buildings." He said that in the construction of the Manchester Corporation Technical School in Sackville-street advantage had been taken as far as possible of the experience gained in the erection of similar buildings elsewhere, and that in consequence there were many matters of professional and technical interest connected with it. Schools differed, however, so much in aim, resources, scope, site, and other circumstances, that one rarely found the methods adopted in one place just those best suited to the conditions and requirements of another. As an illustration of this, he pointed to the absolute necessity of providing for the greatest possible amount of light in buildings situated in a city like Manchester, which, by reason of the narrow streets and the pall of smoke which overhangs it, enjoys but little of the blessed light of the sun. The question of fenestration assumed vital importance under such conditions, and virtually determined the style of architecture, or at any rate limited the range of choice. From this point of view, the Gothic style, as exemplified in the town-hall or in the Owens College, was to be condemned. So, too, was a style of architecture which required for its best effects heavy projections and consequent deep and widely-extended shadows, or, again, a style which demanded small windows for the sake of gaining picturesque or quaint results. He knew that architects delighted in the sense of repose which was derived from large blank wall space as a relief from window openings and other distracting features of the elevation of a building, but that it was possible to make a satisfactory compromise between the demand for light and architectural conventions was seen in the building of the Williams Deacon and Manchester and Salford Bank in Mosley-street, and in the warehouse recently erected by the Tootal Broadhurst Lee Company in Oxford-street. Mr. Reynolds proceeded to offer suggestions as to the means by which beauty and utility might be obtained in technical school buildings. His paper was illustrated by a number of limelight views. On the motion of Mr. Edward Salomons, seconded by Mr. J. H. Woodhouse, a vote of thanks was accorded to Mr. Reynolds.

Society of House Decorators and Painters.—The general council delegate meeting of the above society was held last week in Bristol, and attended by delegates from various parts of the country. Mr. E. C. Thackwell, of Plymouth, was chairman, and Mr. W. F. Wallis, Croydon, vice-chairman. The society is a sick-benefit society as well as a trade organisation, and the twenty-fifth annual report issued by the general secretary, Mr. E. C. Gibbs, shows that the membership at the end of 1897 was 3,726, an increase of 341 during the year. The income for 1897 was £4,158, making, with the balance brought forward, a total of £8,031. The year's expenditure was £3,237, leaving a credit balance of £4,797, and showing a clear gain of £920. It may be mentioned that during the twenty-five years of its existence the society has paid £15,534 in sick benefits, and £3,135 for funerals, while the strike pay and trade protection expenses have absorbed only £3,039. The chief purpose of the delegate meeting was the revision of rules.

CHIPS.

The will of the late Mr. Donald Munro Drysdale, of Princess-road, Liverpool, timber merchant, has been proved; the gross personalty is £19,807 5s. 6d., and the net £19,692.

The annual meeting of the Royal Archæological Institute will be held at Lancaster from Tuesday, July 19th, to Tuesday, July 26th.

Tettenhall Wood Church was re-opened on Sunday, after undergoing internal renovation, which has been carried out by Mr. Heath, from the designs of Mr. T. H. Fleeming, of Wolverhampton.

A instance of zeal in the service of the church comes from Southrey, Lincolnshire, where the curate of Bardney (the Rev. Mr. Knox), who is said to have qualified as an architect before entering the church, is now acting as clerk of the works, foreman of building operations, joiner, bricklayer, and general labourer on the felt-lined wooden church he has himself designed.

The chapel of St. Edmund's R.C. College, which has been closed since Christmas for alterations and improvements, was solemnly reopened last week. The changes include an additional row of stalls, while the floor of the whole chapel and sacristy has been renewed; the sacristy has been laid with parquetry, and the chancel is tiled. The architect is Mr. Austin Heyes, of Fulham.

The Light Railway Commissioners concluded a lengthy inquiry at Bournemouth on Friday, with respect to applications by two electric tramway companies, for powers to construct lines connecting Bournemouth, Poole, Christchurch, and suburbs. Strenuous opposition was offered by the Bournemouth Town Council to any tramways being laid within the borough, and the commissioners decided that no public necessity had been proved to induce them to overrule the decision of the council, or to authorise any remaining portions of the two schemes which lay outside the borough.

The property market at Tokenhouse-yard is in a healthy condition just now, and when properties are brought into the market with reasonable reserves there is very rarely a lack of buyers. The aggregate realisation for the week at the Mart is £112,072, which again shows an advance over the amount registered in the corresponding week of last year.

Colonel A. J. Hepper, a Local Government Board Inspector, held an inquiry at Gainsborough on Friday in respect to an application by the Urban District Council for sanction to borrow £2,500 for the purchase of land for the purposes of public offices, street improvement, and market accommodation. Evidence in support of the application was given by the clerk (Mr. D. M. Robbs), who stated that since 1871 the population had increased from 7,564 to 19,187.

The laying of the foundation-stone of a new Roman Catholic church of Our Lady of Perpetual Succour at Gillingham, near Beccles, took place on Thursday in last week, according to the Roman Pontifical. The building will be of red brick, with stone dressings, and will consist of sanctuary, sacristy, confessional, lobby, nave, and campanile about 60ft. high, the dimensions of the church being 77ft. in length and 22ft. wide.

Building Intelligence.

Coxlodge, Newcastle.—The city lunatic asylum for Newcastle-on-Tyne, at Coxlodge, near Gosforth, is nearing completion. The original asylum was opened about 31 years ago, the main building accommodating 300 patients. Two wings, for male and female patients, were added in 1885, increasing the accommodation by 150 places. Not long after the committee added to the estate some 28 acres of land, and half a dozen years since invited competitive plans from local architects for buildings for 350 patients. Those by Mr. J. W. Dyson, of Newcastle, were selected by Mr. G. T. Hine, the assessor, and are now being carried out. Mr. John Ferguson was the contractor for the foundations, and Mr. Walter Scott, also of Newcastle, for the superstructure. The extension will accommodate 361 male patients. The buildings are arranged in two-story blocks, the external walls being of stone, and roofs of Bangor slates. The patients' blocks have the space between ground-floor ceiling and first floor constructed on Messrs. Mark Fawcett and Co.'s system of improved fireproof flooring, the ceilings to upper floors being of concrete. The ordinary floors and woodwork generally are of pitchpine; the lavatories, bath rooms, corridors, &c., being lined with glazed bricks, and the staircases being built of Yorkshire stone. The heating and ventilation are on the plenum system, the apparatus being placed below the buildings in subways. The heating and ventilating arrangements have been placed with Messrs. Ashwell and Nesbit, Newcastle and London. Doulton's manufactures are being employed for the sanitary fittings. The building contracts have cost £12,000, and £113,315 for foundations and superstructures respectively.

Handforth.—The foundation-stone of the new church of St. Chad was laid on Saturday, Feb. 19. The church is designed in the Perpendicular style of architecture, with half-timber gables and other details characteristic of the buildings of Cheshire. When completed, the edifice will consist of nave, chancel, north and south transepts, organ-chamber, and clergy and choir vestries. At the south-west angle of the building will be a belfry-tower, the tower-stage forming an entrance-porch. The church is arranged to give accommodation for about 300 sittings when completed. The work is being carried out under the supervision of Mr. John Brooke, A.R.I.B.A., 18, Exchange-street, Manchester. The contractor for the work is Mr. Thomas Browne, of Chester.

Stonehaven.—A granite residence has just been completed at the junction of Bath-street and Slug-road for an English gentleman, and will be used as his summer residence. It is Scottish Baronial in style, the south and west elevations (which are the exposed ones) being built in Kemnay granite, and the ashlar rock-faced, with fine picked dressings. The front elevation is 72ft. in length, the centre turret rising to a height of 55ft. The roof is covered with Tiberthwaite green slates, and the ridge has an iron cresting. The inside finishings are all of American poplar, known as canary weed, except the staircase, which is of pitch-pine. The hall containing the staircase is lit by a cupola from the roof, and forms one of the principal internal features. The following contractors have carried out the various works:—Mason work, Mr. George Gregory, Stonehaven; carpenter work, Messrs. R. Thomson and Sons, Stonehaven; slater work, Mr. Charles Maitland, Aberdeen; plumber work, Mr. A. Mathieson, Stonehaven; plaster work, Messrs. Scott and Sellar, Aberdeen; painter and glazier work, Messrs. Barron and Son, Aberdeen. The building was designed and carried out under the superintendence of Mr. J. Augustus Souttar, architect, Aberdeen.

Salisbury Cathedral.—The work of restoring the spire and turrets of Salisbury Cathedral, which has been in progress during the past two years, is now almost completed, and in the course of the next few weeks it will be entirely finished, and the scaffolding, which at the present time envelops the tower and a large portion of the spire, will be removed. The work has been carried out under the direction of Sir A. W. Blomfield, A.R.A., and in a recent report to the committee he informed them that the turret at the north-west angle of the tower was in such a bad state that it was needful to take it down. It has been rebuilt. Every stone that could be reused appears again in its proper place, only new stones being introduced wherever the original stonework has been crushed, broken, or in such small stones as to be unsafe. The turret staircases at the four angles of the tower, which have to support so much of the enormous thrust of the spire, have been repaired and strengthened. On all four sides defective masonry has been taken out and replaced by new stones weighing in some cases upwards of a ton. The foundations of the south aisle and of the west side of the south transept have yet to be repaired. Altogether the cost of the work will be about £15,000, of which £1,400 remains to be raised.

CHIPS.

The Jubilee Schools for Girls at Conway, erected at a cost of £1,500, were opened on Monday week by Mr. J. Ernest Greaves, the lord-lieutenant of the county.

A Victoria Wesleyan Hall has just been built in Knowsley-street, Bolton, at a cost of £30,000, including purchase of portion of site. The architects are Messrs. Bradshaw and Gass, of Bolton.

An extensive block of buildings to be occupied by Messrs. W. A. and A. C. Churchman, wholesale tobacconists, has just been erected at the corner of Prince's-street and Portman's-road, Ipswich. They are of red brick, and are fitted with the electric light. Mr. J. Shewell Corder, of Ipswich, was the architect, and Mr. Fred Bennett, of the same town, the builder.

The ceremony of laying the foundation-stones of the new workhouse infirmary at Warrington was performed on Friday. The new infirmary is in close proximity to the workhouse. The contractor is Mr. Davenport, of Stockton Heath, and the architect Mr. William Owen.

An inquiry was opened on Friday before Mr. Dawson, Government Inspector, at the Board-room, Union Workhouse, in Thirsk, concerning the surcharge of £310 3s. 1d. to the surveyor of the Thirsk District Council. Mr. Combie, of York, appeared both for James Wright (the surveyor to the council) and also for the Wright family, consisting of three brothers, trading under the name, as contractors, of Wright Bros., of Thirsk, who had entered into various contracts with the Council of the Thirsk Rural District Board, for leading, &c., in the district. The real point at issue was as to the existence of such a firm as Wright Brothers, of Thirsk, and it appeared that at the last June audit the auditor had disallowed the above sum for various reasons, one of the principal being that the firm of Wright Brothers did not exist, and if it did they had their carts and horses on the surveyor's (their father's) premises.

The length of new railroad constructed in the United States last year was 1,864 miles, as compared with 1,848 miles in 1896, 1,803 miles in 1895, 1,949 miles in 1894, 2,635 miles in 1893, 4,192 miles in 1892, 4,281 miles in 1891, 5,670 miles in 1890, 5,230 miles in 1889, and 7,106 miles in 1888. The length of railroad in operation in the United States at the close of last year was 184,464 miles. The greatest length of line was built last year in the state of California, where 210 miles of railway was added to the mileage, Louisiana coming next with 145 miles.

Mr. Herbert H. Law, an inspector under the Local Government Board, held an inquiry at the Sunderland Town Hall on Friday into the petition presented by the corporation to that body for a provisional order to empower the corporation to acquire compulsorily lands for widening High-street, West; and, further, to borrow £2,020 for electric-lighting purposes.

Gainsborough Urban District Council Highways Committee has decided to recommend a complete scheme for the reconstruction of Gainsborough streets at an estimated cost of £4,000 or £5,000.

The new line from Mold to Wrexham will be opened for passenger traffic early in April. By an extension of the existing Mold and Coed Talon branch as far as Wrexham the new route will give a through connection between Denbigh, Mold, and Wrexham.

A new temporary fever hospital at the workhouse at Dearnley, near Rochdale, was formally opened on Wednesday week. The hospital is a timber-framed building, covered outside with corrugated iron and lined inside with varnished match boarding, with a layer of inodorous felt between. These are two pavilions, each 80ft. by 24ft. and each meant to hold 24 beds. Messrs. Butterworth and Duncan, of Rochdale, were the architects. It was built by Messrs. E. J. and C. Keay, of Birmingham, who contracted to finish it within six weeks, and did so. Messrs. W. A. Peters and Sons, of Rochdale, undertook the foundations and the draining, and Messrs. Hewerdine and Dawson the plumbing and sanitary work.

PARLIAMENTARY NOTES.

The National Gallery.—Dr. Farquharson asked the First Commissioner of Works whether, on the lines of the precedent so successfully followed in the case of the South Kensington Museum, he would obtain an expert report as to the danger by fire to the National Gallery, arising from its close proximity to St. George's Barracks and other inflammable buildings. Mr. Akers-Douglas: I do not think that an expert report is necessary, or can add to the knowledge already possessed by the Office of Works. As was the case at South Kensington, the construction of the several portions of the buildings and the circumstances of their surroundings are well known to the Department, and the question of danger from fire from outside inflammable buildings has constantly engaged its attention. Adjacent property has quite recently been purchased by the Government, with a view to lessening any such danger, and a similar course will be followed as opportunities occur. The House is aware that arrangements are in progress for the removal of the southern portion of St. George's Barracks.

A cottage hospital for Accrington and district was opened on Monday by the mayor. The hospital has cost over £7,000, and will accommodate 18 patients.

Mr. J. Bryn Roberts, M.P., formally opened on Tuesday the new board schools at Bronyfoel, near Llandwrog, Carnarvonshire. The schools have been built from the designs of Mr. R. Ll. Jones, Carnarvon, and are situate at a high altitude among the Cambriam group of mountains.

The number of men employed in the building trades at Monteith, N.B., exceeds all previous record. Large numbers of workmen are employed at the new railway station, which is being rapidly proceed with. A large addition is under course of construction to the public school. Semidetached cottages are being erected in Panmure-street, Ramsay-street, Albert-street, and Maule-street.

The temporary building in which the congregation of Whitefield's Tabernable, Tottenham Court-road, have been meeting has been sold, and the site will be cleared in a few days for the erection of a permanent structure on the same spot. A few years ago the old structure had to be taken down because it was insecure. The new edifice has been designed by Mr. Rowland Plumbe, F.R.I.B.A., and will be built by Messrs. Kingerlee, of Oxford, whose tender for £11,000 has recently been accepted by the church. Other expenses will raise the total cost to nearly £12,000.

The demolition of the old infirmary buildings at Halifax has been commenced this week. The first portion of the infirmary was erected in the years 1836-38 at a cost of £2,400, the building being opened in the latter year. Since that time wings have been added, and in 1877, owing to increasing requirements, the assembly rooms were acquired. Now the whole of the erections have to come down to make room for the new police offices and court-house which are to be erected there. All last week Messrs. Newsome, of Sowerby, were busy removing the woodwork and plumbing fittings, and this week the shell of the building is being tackled by Messrs. J. Charnock and Sons, who have erected a steam-crane.

The Bishop of Rochester has reopened and dedicated St. Mary Magdalene Church, Southwark, after restoration at a cost of £3,700. The old barn-like appearance has gone; the decayed and dangerous plaster ceiling has been covered with an inner wooden roof of fine proportions; a new organ has been built by Messrs. Hele; the case, of solid oak, is in harmony with the Gothic lines of the church. The windows (all new except one), are of cathedral glass. The new west window, which pierces a formerly blank wall, in three lights, is filled with painted glass. A new porch being built enables the long-closed west door to be opened as the principal entrance for the future. Ugly, uncomfortable pews have given place to pitch-pine open benches. The raised chancel enables the people to see and hear.

"A Plea for an Archæological Map of Warwickshire" was the title of a paper read before the Archæological section of the Midland Institute, at Birmingham on Friday night, by the Rev. J. O. Bevan, who has taken part in the compilation of a work based on an exhaustive archæological survey of Herefordshire. The Society of Antiquarians is urging the systematisation of information of archæological interest throughout all the counties of England and Wales, and the work accomplished in Herefordshire shows how usefully researches in this direction may be crystallised in maps. The paper was followed by lantern pictures, illustrating old Warwickshire. Mr. Bevan expressed a hope that means would be taken to initiate practical steps for compiling an archæological map of Warwickshire. Mr. W. J. Churchill gave an assurance that the question should be brought before the committee of the Architectural section.

SIENA CATHEDRAL, WEST FRONT.—MARLBOROUGH HOTEL, BURY STREET, ST. JAMES'S.—SHANKHILL ROAD MISSION BUILDING, BELFAST.—"NEWDIGATE PLACE," SURREY.—HISTORIC ORNAMENT.—THE DINING HALL AT THE CHARTERHOUSE.

Our Illustrations.

THE FACADE, SIENA CATHEDRAL.

Hawthorne, in writing of this very magnificent and world-famed building, says, "The cathedral is a religion in itself; how much pride, love, and reverence in the lapse of years must have clung to all this sculpture!" To this artistically-expressed idea, Mr. Wallace Rimington, the author of the accompanying equally charming study of the façade, has written the following note:—"At first one feels that there is perhaps an over-delicacy in the white marble churches of Italy; but the better you know them the more you realise their elaborate detail lends itself to such a subtle play of reflected light that the beauty of their shell-like opalescence compensates for the absence of the nobler proportions and greater picturesqueness of the cathedrals of the North." We gave an illustration of this interesting cathedral, with further particulars, on Sept. 6, 1889.

MARLBOROUGH HOTEL, BURY STREET, ST. JAMES'S.

This hotel, now in course of erection on the corner site formerly known as Ramsay's Hotel, and to which has been added No. 12, Bury-street, and Nos. 12 and 14, Ryder-street, is being carried out in accordance with the designs and under the superintendence of Mr. G. D. Martin, architect, 3, Pall Mall East, S.W., and will consist of seven floors. The basement has been planned for kitchens and the offices of the management, and there will also be a well-lighted billiard-room and gentlemen's lavatory. The ground floor will consist of a large dining-room, vestibule, entrance-hall, reception-room, bureau, and cloak-room, together with staircase and hydraulic elevator. The five upper floors will contain ladies' and general drawing-rooms, and about 60 bed and sitting rooms. There will be ample bath and lavatory accommodation on each floor. The elevation, which is of Renaissance style treated in a free manner, will be executed in red brick with Monk's Park stone dressings. The whole of the floors, partitions, and roof will be of fireproof construction.

SHANKHILL ROAD MISSION BUILDINGS, BELFAST.

This block of buildings, of which the foundation-stones were laid on Oct. 23rd, has a frontage of 92ft. and a depth of 135ft. free from ancient-light restrictions on every side. In designing the building it was sought to avoid the long corridors, so universal in buildings of this description, by contriving a central octagonal hall with galleries round and large dome light. This hall will give access to all the departments of the building which radiate from it. The building is divided into seven principal departments. The first of these is a large hall capable of seating about 2,000 people, designed in the form of an amphitheatre with a single gallery. This hall will have entrances and exits from the Shankhill-road, and also from Carlow-street, will be well lighted, and will be in all respects a hall well adapted for large social gatherings. In connection with the hall are gentlemen's, ladies', and choir committee-rooms and cloak-rooms. The second is a medical mission department, comprising a large waiting-hall, capable of seating about 200; a doctor's consulting-room, and dispensary and dressing-rooms. It is entered by the main entrance from the building, and will also have a separate entrance from Carlow-street, enabling it to be used directly from the outside. The third, or business, part of the premises will consist of four large shops—two on either side of the main entrance—and also commodious offices over these shops. The fourth is a soup-kitchen department, with ample convenience for cooking and supplying soups and other nourishing provisions for the benefit of the poor, and also giving the necessary plant for supplying large social gatherings in connection with the mission. This department can also be entered direct from the Shankhill-road. The fifth section comprises a minor hall and classrooms. This hall will be situated on the first floor, and capable of accommodating 250 people. There will also be several class and committee-rooms. The sixth is a social and recreative department. These rooms will be situated on the second floor, and will comprise general parlour, men's reading-room and library; boys' club-room and girls' guild-room; and also ladies' private sitting-room and bookstall. The seventh department is the residential training home; this will comprise four separate departments—(1) a wing with parlour and bedroom accommodation for gentlemen students, and a corresponding wing for lady students; (2) the superintendent's residence; (3) the servants' department; (4) the lecture-hall and classroom department. Altogether there will be accommodation for 20 students. Over a part of the building there will be a flat roof with staircase communication, so that it can be used as recreation ground in the summer months. The materials proposed in the construction of the building are Scrabo stone for the front elevation and part of the return, with red brick for the remainder. The roof will be covered with Westmoreland green slates for the towers and front part of the building. The N.A.P. Window Co.'s patent fittings are being adopted for principal windows. The main entrance-hall and cloakroom walls will be tiled, and granite plaster will be used on the walls in more general use. There will be fireproof floors over the greater part of the first two stories, thus making the building not only more secure, but preventing the passage of sound from one part to the other. Internal fittings have been designed in an inexpensive but substantial manner. Mr. W. J. W. Roome, M.S.A., is the architect, and Messrs. M'Laughlin and Harvey are the contractors.

"NEWDIGATE PLACE."

This house is erected on an elevated site overlooking Leith Hill, with lovely views over Reigate and Horsham. The walls are faced with local red bricks, the upper part being covered with weather tiling. The roofs are tiled, the whole of the external woodwork is of oak, cut from trees grown on the estate. The entrance hall has an open oak timber roof, with a gallery round two sides, and lighted by stained-glass windows. It is panelled to a height of 10ft., with oak panelling, a carved screen separating the hall from staircase, which is also oak. The dining-room has oak panelling, with oak beams to form panelled ceiling. The drawing-room has a deal dado, painted ivory white. The billiard-room has Oregon pine framing carried up to underside of frieze. All other internal joinery is also in Oregon pine, stained and beeswaxed. The house was erected by Messrs. J. and J. Ward, of Warlington, from the designs, and under the superintendence, of Mr. J. Hatchard Smith, F.R.I.B.A., who also designed the decorations, which have been carried out by Mr. Carrick, of Reigate.

HISTORIC ORNAMENT.

This plate represents a series of capital drawings illustrative of historic design, and with each object their author, Mr. John J. Brownsword, has written an accompanying account, so that no further description by way of letterpress seems necessary. The sheet forms part of a series for which a National Silver Medal was given to Mr. Brownsword last summer.

CHARTERHOUSE SQUARE.

(See descriptive article on p. 300.)

COMPETITIONS.

Dorking.—The workhouse infirmary committee of the Dorking Board of Guardians have reported that Mr. James Edmeston, the assessor appointed by the board, had awarded the prizes in the competition for the best plans for the proposed new infirmary as follows:—1st, Mr. H. Percy Adams, 28, Woburn-place, Russell-square; London; 2nd, Mr. J. H. Cossar, Stamford; 3rd, Mr. Clarence Coggin, 15, York-buildings, Adelphi. The committee also reported that a letter had been received from Mr. Edmeston, stating that he was not sure that any of the designs submitted could be fully carried out for £4,000, and suggesting that the architect should be asked to furnish a guaranteed tender from some substantial builder. Thirty-nine competitive designs were sent in. The drawings have been on view this week.

Rhondda Valley, Glamorganshire.—At the last meeting of the Rhondda District Council, a committee brought up their report and their award on the plans sent in for competition for an isolation hospital to be erected by the council at Ystrad, and recommended the plan numbered 6. This report was adopted, and the successful competitor was Mr. W. D. Morgan, architect, of Ton Pentre, Rhondda Valley. Accommodation is to be provided for 32 patients, matron, nurses, and non-resident medical officer, with laundry, disinfecting and discharging blocks, &c. The cost of the proposed scheme is estimated at about £10,000. Ten sets of designs were received.

CHIPS.

A new chapel has been erected at Chesham, and special attention has been paid to the ventilation, which is carried out on the Boyle system.

Mr. Solomon J. Solomon, A.R.A., is engaged in painting a picture depicting the Lord Mayor and Sheriffs awaiting at Temple Bar the arrival of the Queen on Jubilee Day.

A Primitive Methodist chapel in Moor-street, Brierly Hill, was opened on Monday. The front of the edifice is Renaissance in style, and is of brickwork, with terracotta ornamentation. The church has an open roof, the principals being filled in with carved and pierced work and shaped spandrels. The pewing and framing are of pitch-pine, and polished walnut is used for the rostrum. The chapel is heated by hot water. A raised gallery is provided for choir. Messrs. Hicklon and Farmer, of Walsall, are the architects, and the work is being carried out by Mr. Horton, contractor, of Brierly Hill. The total cost has been £1,500.

The death at an early age from consumption is reported from Canada of Mr. D. G. Baxter, of Stratford, Ont., one of the best known and most talented of the younger architects of the province. He was the first architectural student to pass the examinations of the Ontario Association of Architects.

At Ipswich, on Tuesday in last week, the foundation-stone was laid of a building to be erected in accordance with the will of the late Mr. R. C. Rapier, to serve as a rest for the workmen at the Waterside Iron Works of Messrs. Ransomes and Rapier. The site is close to the entrance gates, and the building will have a frontage of 80ft. There will be a coffee-room, a reading-room, and lavatory accommodation. Mr. Fred. Bennett, of St. Clement's Works, Ipswich, is the builder.

Colonel Durnford held an inquiry at Llandudno on Friday, on behalf of the Local Government Board, respecting applications by the urban district council for sanction to borrow £8,634 for the works of water supply, £3,583 for gasworks purposes, and £1,394 for the purchase of land as a site for workmen's dwellings.

The Conservative club at Oswestry was reopened on Feb. 24th after the addition of a wing. The improvements consist of a new billiard-room, bar, lavatories, and alterations to the hall and card-room. The general contract was let to Mr. William Felton, Oswestry, the seating and decorating being executed by Messrs. J. Jones and Son, also of Oswestry. The work has been carried out from the designs and under the superintendence of Messrs. Shayler and Madoc-Jones, architects, Oswestry. Mr. E. M. Gardner fitted the heating apparatus.

Extensive building operations are going on at the Lower Brewery, Stone-street, Maidstone, in connection with the erection of new premises and plant, and on Wednesday week the foundation-stone of the new brewery was formally laid. The builder's work is being executed by Messrs. Wallis and Sons, of Maidstone; the ironwork by Messrs. Eastwood, Swingles, and Co., Limited, of Derby; the coppersmith's work by Mr. R. Dann, of Maidstone; and the slate backwork by Mr. J. Dean, of the Central Buildings, North John-street, Liverpool.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of Eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound copies of Vol. LXXII. are now ready, and should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XXXIX., XL., XLI., XLVI., XLIX., LI., LIII., LVIII., LIX., LXI., LXII., LXIII., LXIV., LXV., LXVI., LXVII., LXVIII., LXIX., LXX., LXXI., LXXfI. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Correspondence.

THE GOLD MEDAL AT THE INSTITUTE.

To the Editor of the Building News.

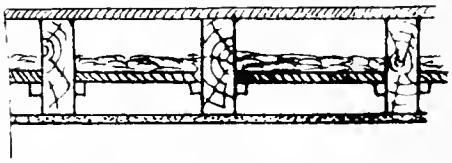
Sir,—To read the remarks addressed to you by Mr. Woodward, and also the letter which you have printed on this subject from the pen of "An Art Worker," it might be thought, if we did not know better, that the so-called "snuggery" of a Council at Conduit-street was a self-elected body, whereas they are the elect of the voting open to all members of the Institute; and, moreover, I beg leave to assert, this self-same somewhat scandalised Council contains a few, at any rate, of the most capable men in the ranks of the architectural profession. There are, I daresay, a few wire-pullers there, and one or two who have just managed to pass muster in order to further individual ends; but whatever their failings, it is of no use ignoring the fact that the votes of the members have put these gentlemen into office. Of course, everybody is aware that nothing more than a very luke-warm interest is taken in these elections, only a comparatively small proportion of the electorate taking the trouble to vote at all. Architectural politics for the time seem moribund. Now and then some enthusiastic reformer obtains an admission to this estimable board; but his vitality is speedily absorbed by the sterilising conservatism which always seems to dominate the proceedings of the Institute Council; or possibly, at last, he gives up his endeavours in despair, particularly as he realises how unwelcome such aims are, how much time he has to devote in farthering them, and how unlikely, if persisted in, they are to develop chances for personal advancement. The giving of the Gold Medal, after all, to Mr. Aitchison by the Council can do the recipient no harm, and possibly but little good. If mutual satisfaction is secured thereby, why make all this pother? The recipient's old friend, Wm. Burges, used to say it ought to be shot for. Ruskin declined it, and Mr. Butterfield, though he allowed the medal to be accorded him, would not come to receive it. The honour is not an unprecedented one, and who can tell the internal difficulties which beset the Council? It is not in the least likely that they will condescend to take any notice of critical communications in the newspapers, anonymous or otherwise:—why on earth should they? All the same, it does appear a pity that the Council should remain, for all practical purposes, so incapable of dealing with unprofessional conduct on the part of its members—men who care nothing who sinks so long as they swim. Anything like decided action by the Council in such matters is never heard of—at any rate, not since the Metropolitan Board of Works days. The cases requiring such drastic measures as expulsion no doubt are happily rare; but still it cannot be denied that scandals are not unknown. I do not refer, of course, to the non-payment of subscriptions; naturally enough, men are struck off the list for that. Why is it that the Council of the Royal Institute of British Architects is not a real influence in the profession and in the art world? Never mind, my masters, about the Gold Medal.—I am, &c.,

Functus Officio.

Intercommunication.

QUESTIONS.

[11909.]—**Silicate Cotton.**—I have lately used silicate cotton in sheets 2in. to 3in. thick, laid on boards between the joists of a floor over a drawing-room, for the purpose of sound-proofing such floor. In one case where I used this material the result was quite satisfactory; but in a recent case, where the walls supporting the joist-ends are cavity walls, the silicate cotton has not been of any use in sound-proofing the floor; in fact, the noise of traffic on this floor is more distinctly audible than in any



other part of the building where the floors are not sound-proofed. If any of your numerous subscribers have had a like experience with the use of this material, I shall be glad if they will, through your columns, say what means they used to remedy the defect?—W. H., Manchester.

[11910.]—**Painting Corrugated Iron.**—I want a ruby-red paint to put on a corrugated iron roof, so that it may be made to look as if tiled with red tiles. Some eight years ago I got from a Hull firm a ready-mixed paint which was very good in every way and kept its colour splendidly. On asking this firm to repeat the order, they sent me Indian red, which is as near the colour I require as the two poles to each other. When I returned it they said they couldn't carry out the order. Red lead and orange lead are of no use, for they turn black in a very short time. I want a very bright ruby-red that will keep its colour. Is it an oxide that should be used? I shall be truly grateful if any of your readers can help me.—James Cooper, Cayton, Scarborough.

REPLIES.

[11906.]—**House Drainage.**—"Domus" had better place an inspection-chamber at the foot of soil-pipe, and another turning chamber at the corner where the soil-pipe drain turns the corner of the house. The sink can be made to enter this chamber. Then the side main drain should be made to run straight to the disconnecting manhole near the front sewer. A good form of disconnecting trap is the "Improved Kenon," which is inserted in the outgo side of manhole, and has a cleaning arm and plug over. The chamber may be about 3ft. square. The separate r.w. branches should run into the straight drain where necessary. "Domus" is right as to this drain. The manholes should be ventilated, if possible—at least, the disconnecting one near sewer. Send for Crapper and Co.'s or Doulton's lists of gully-traps.—G. H.

[11907.]—**Jointing Drain-Pipes.**—If the drain is for a house, and the ground is firm and not clayey, I should recommend neat cement, or cement and sand in the proportion of 1 of cement to 2 or 3 of clean, sharp sand. If the soil is yielding, Doulton's or Stanford's joints are recommended. The cost of the latter is trifling.—G. H.

The general asylums committee of the West Riding County Council have purchased a site of over 200 acres at Ackworth, as a site for a fourth pauper lunatic asylum. The cost of the land is about £46,000, and the building itself is expected to cost between £450,000 and £500,000.

WATER SUPPLY AND SANITARY MATTERS.

The Metropolitan Water Supply.—At Monday's sitting of the Royal Commission on this subject, Mr. W. H. Dickinson, chairman of the Water Committee of the London County Council, was examined. He said that since 1891 the policy of the Council with regard to the water question had strictly followed the recommendations of Sir M. W. Ridley's committee. In his opinion, in order to arrive at the true value of the undertakings of the companies, there were problems to be solved which were beyond the province of any ordinary administrator, and an arbitrator should be appointed with special powers. He justified the arbitration clause in the Purchase Bill introduced by the County Council, and said the Council had always been of opinion that the result of ordinary arbitration under the Lands Clauses Act would be to give the water companies a present of six or seven millions of money. The witness gave a detailed account of the action and attitude of the County Council on the whole question of the London water supply.

The Water Supply of South Staffordshire.—Barr Beacon, one of the most prominent landmarks in the Birmingham district, has been selected by the South Staffordshire Waterworks Company as a site for a distributing reservoir. Near Bourne's Pool, the company during the last three or four years have sunk wells, and found a good supply. This water they propose to pump to the top of Barr Beacon. The reservoir is the third which the company have found it necessary to construct lately, in consequence of the increasing population. The South Staffordshire Company's district embraces portions of the counties of Stafford, Derby, Warwick, and Worcester, its extremes reaching from within about three miles from Derby to about eight miles from Kidderminster, a distance of over 40 miles. Its greatest width is 20 miles, and its area is 276 miles—the largest area supplied by any water undertaking in this country, comprising 48 towns and parishes. The population of the whole area is about 566,000, and the company supplies 94,853 houses, or an estimated population of 474,265. The maximum quantity of water supplied per day approaches 12½ million gallons, and the total for the year 1896 was 3,206 million gallons, of which 871 million were for trade use. The new works, which are being carried out under the direction of the company's engineer (Mr. H. Ashton Hill, M.Inst.C.E.), will bring the number of reservoirs owned by the company to sixteen. The storage reservoir now in course of construction will supply, among other places, West Bromwich and Walsall. The works on Barr Beacon were commenced in May last year, and will be finished before the spring of 1899. The top level of the reservoir will be 744ft. above ordnance datum. The company have acquired seven acres of land, and the reservoir will occupy about three-fourths of this area. Built with sides sloping internally, the reservoir will measure at its margin 410ft. by 310ft., and at the bottom 350ft. by 200ft., the depth being 21ft. Its storage capacity will be upwards of ten million gallons. The soil in which the reservoir is being made is gravel drift. Clay is plentiful, however, in the immediate neighbourhood, and this will be utilised for puddling the sides and bottom, consisting of 18in. of clay, 9in. of concrete, and 3in. of blue-brick masonry. The clump of trees, by which the hill is recognised far and near, will be outside the boundary, and will not be interfered with. The early British earthworks which are still to be traced on the hillside will not be disturbed. A novel method of excavation has been adopted by the contractors for this portion of the work, Messrs. R. and B. Bomford, of Pitchill. The ground has been first loosened by steam cultivators. Following upon these, an apparatus has been used, the essential part of which is a large scoop, which will hold 30cwt. of soil. This scoop is attached to a wire rope, and is dragged through the soil by a portable winding-engine, as in steam-ploughing. Attached to it is a small car, in which the attendant rides, and gearing is provided by means of which the scoop, when it has been filled and has reached the tipping place, can be overturned. Another change of the gearing sets the scoop clear of the ground for the return journey. By means of these scoops 12 men have been able to do the work of 200 navvies. This is the first instance of the complete application of this method, and it has been developed under the direction of Mr. Evershed, Messrs. Bomford's representative. The contractor for the reservoir is Mr. George Law. The other two reservoirs have been completed. One is at Shire Oak Hill, near Brownhills, and was finished about 12 months ago. It has a capacity of 4½ million gallons, and its top level is 593ft. above ordnance data. The other is at Springsmire, near Dudley, and has a capacity of 3¼ millions. These two reservoirs have vertical sides and concrete walls, lined with brickwork.

Mr. James Saunders, A.R.I.B.A., assistant borough surveyor of Oldham, has been elected city surveyor of Chichester.

LEGAL INTELLIGENCE.

The London County Council and the Works Department.—The referee's award in the action between James Miller (plaintiff) and the London County Council (defendants), remitted by order of Mr. Justice Hawkins from the Queen's Bench Division to Mr. Herbert Thomas Steward, architect and surveyor, of 45, Parliament-street, was received on Friday. Litigation in the case has been pending since 1895. The plaintiff in the action is the owner of a number of small cottages in Miller's-avenue, Stoke Newington-road. At the rear of these cottages and on a much lower level was a building which had been decreed as dangerous by the County County officials. The case for the plaintiff was that the County Council sent their workmen from the Works Department, and altogether demolished the alleged dangerous structure. In doing so they removed a portion of a wall which had hitherto held up the higher land at its back, and plaintiff's cottages were then in danger of falling down. To make the damage good the plaintiff had to build a new wall, and he called on the County Council to recompense him for the cost he had been put to. As they declined to pay, he brought an action for damages. The referee awarded the plaintiff £17 10s., and directed the defendants to pay the plaintiff his costs of the law action, including the costs of the reference and also the referee's fees and the costs of his award. The fees and the costs of the award were assessed at £65 9s. 6d. There were several counsel engaged in the case and 29 witnesses, some of whom were leading surveyors.

Party-Wall Notices.—At Guildhall Police-Court on Feb. 25, Messrs. Spencer and Company, of 32, Commercial-road, Lambeth, were summoned at the instance of Mr. E. Woodthorpe, M.A., district inspector for the northern part of the City, for that, on or about January 5 last, they did certain work at 45A and 46A, Basinghall-street, and 4, London Wall-avenue without giving proper notice under the Building Act, 1894. Evidence having been given to the effect that a hole had been made in a party-wall without notice being given to the district surveyor, a fine of 40s. was imposed and £2 2s. costs.

Builder and House Agent.—Messrs. Holliday, Pearson, and Co. v. Frederick Moore.—The plaintiffs, who are builders and estate agents, of 1, Queen's-parade, Streatham, brought an action in the Wandsworth County Court to recover the balance of account, £32 9s. 6d., of a verbal contract, £48 16s. 10d., of which £10 had been paid on account, &c. (this included fees to plaintiffs for obtaining house and stamping agreement). The defendant, an agent of house property in London, alleged that the works were not completed by plaintiffs. This action was part heard by his Honour on the 17th January last, who ordered it, by consent of both parties, to be referred to the court arbitrator, Mr. R. M. Hiscocks, architect and surveyor, of No. 1, Church-row, High-street, Wandsworth. The arbitrator having heard evidence, and measured the works, extras to dwelling-house, 45, Barrow-road, Streatham Common, found the value of all the work (after deducting work which had been omitted), including agents' fees, to be £30 14s., and allowed costs to plaintiffs both in the action and reference. His Honour gave judgment for plaintiffs, £30 14s., and allowed costs, in the terms of the arbitrator's award.

London School Board and the Building Acts.—At the Surveyors' Institution, Savoy-street, Strand, a tribunal of appeal under the London Building Act, 1894, recently sat to adjudicate upon an appeal by the London School Board against a notice of requirement served by Mr. Ellis Marsland, hon. sec. S.A., the district surveyor of Camberwell, calling upon the Board to make certain teachers' rooms 8ft. 6in. in height, instead of 7ft. 6in., as provided for in the plans of a school now being built at Leo-street, Old Kent-road. Mr. H. F. Gibson, from the solicitor's department of the London School Board, appeared in support of the appeal, and Mr. Saager Berry, from the Building Act department of the London County Council, represented the respondent. Mr. Gibson said the district surveyor, by the notice he had served, had attempted to bring the teachers' offices and interviewing rooms within the operation of section 78 of the London Building Act—in other words, had attempted to classify them as habitable apartments subject to the statutory requirement that they should be of a minimum height of 8ft. 6in. The rooms in question, which were built on the half-floors of every school, were assigned to the use of teachers partly as an office, partly as a retiring and cloak room, and partly as an interviewing room. It was true that a small kitchener was erected in each, but even that could not be contended to bring them within the definition of an inhabited room. Mr. T. J. Bailey, architect to the School Board, stated that these teachers' rooms were placed in all the schools built by the Board, and varied from 7ft. to 8ft. in height. That in the projected school at Leo-street would be 7ft. 6in. The only furniture provided were a chair, a table, a lavatory basin, and sets of hat-pegs. All these rooms were planned to meet the approval of the Education Department, which, by their inspectors, exercised strict supervision over the use to which they were put. Mr. Ellis Marsland, the respondent, stated that it was within his knowledge that the teachers' rooms were also used for managers' committee meetings. This was corroborated by Mr. W. C. Williams, chairman of the Westmoreland-road (Walworth) group of schools, who added that it was a matter of general complaint among the teachers that their rooms were very "stuffy" in the winter and uncomfortably hot in the summer. The chairman (Mr. Arthur Cates) said that, taking into consideration the way in which the rooms were used, the tribunal had decided to allow the appeal; but he must point out that the rooms must be used strictly for the purpose for which the Education Department allowed them to be appropriated.

Housing of the Working Classes.—Manning v. Simpson.—An important decision has been given by his Honour Judge French, Q.C., at Bow County Court, in this case. Under the Housing of the Working Classes Act, 1890, there is in the letting of a house or part of a house for habitation by persons of the working classes an implied condition that the house is reasonably fit for human habitation, and the meaning of habitation "by persons of the working classes" is habitation of a house or part of a "house at a rent not exceeding the sum named as the limit of composition of rates by section 3 of the Poor Rate Assessment and Collection Act, 1869." The limit of composition for rates under that Act is a rateable value not exceeding £20 in the Metropolis (other rates for Birmingham, Manchester, and Liverpool), and £8 if situate elsewhere. The plaintiff sued for damages for breach of the condition of a tenancy of a house situate at Forest-gate, in the borough of West Ham, the ratable value of which was more than £8, and less than £20. Mr. Newson, for the defendant, objected that West Ham was not in the Metropolis within the meaning of the Act of 1869, because, by section 20 of that Act, the word "Metropolis" included only the Metropolis as defined by the Metropolis Management Act, 1855, which defined the word so as to include only certain parishes and places mentioned in the schedule of that Act, and the borough of West Ham was not among them. Mr. Minton-Sentouse, for the plaintiff, agreed with that statement of the law so far as it went. The borough of West Ham, however, had obtained a private Act of Parliament, by which section 3 of the Act of 1869 is "in force within the parish of West Ham, as if such parish were situated in the Metropolis." So that a house in West Ham was "situate in the Metropolis"; and if the ratable value was under £20, it would be a house within the meaning of the Housing of the Working Classes Act, 1890. His Honour said that it was clear that West Ham was "in the Metropolis" within the meaning of the Act of 1869. The point was of great importance to a large number of poor people in the neighbourhood of the Metropolis, and it would be of service to them to know that they were entitled to the benefits conferred by the Housing of the Working Classes Act, 1890.

The Perpendicular oak tracery and carvings in St. Mary's Church, Hurley, have just been restored by Mr. Sergeant, builder, Henrenham Hill, near Henley-on-Thames.

The joint hospital committee for the Auckland, Shildon, and Willington District have approved the plans of the infectious diseases hospitals they propose erecting. The plans have been prepared by Mr. Wm. Perkins, M.S.A., architect, Bishop Auckland.

The Admiralty have accepted the tender of Messrs. Woodman, Hill, and Co., of Gosport, for the construction of the breakwater for the protection of the harbour. Messrs. Woodman and Co. built the dolphins, which have recently been completed in the line of the breakwater at a cost of £40,000. The breakwater is expected to cost nearly three-quarters of a million, and to take three years in construction. The quantity of stone required, which is to be obtained from the local quarries, is put at ten million tons.

Some time ago an Act was obtained empowering the harbour commissioners of Hastings to construct a harbour, and raise £200,000 for the purpose. The area of the harbour was to be 27 acres, with a depth at low water spring tides of 12ft. and 25ft. at high water. A contract was obtained in 1896 for the construction of the pier for £120,000. Only £118,000 of the capital could be obtained, but the work proceeded. The western pier has been carried out 1,550ft., leaving 350ft. yet to finish, and also the eastern pier and other works. Further money is required to carry on the works, and, unless this can be obtained the harbour cannot be finished, as the Hastings Corporation have declined to help the promoters.

Our Office Table.

The Dean and Chapter of Westminster have done wisely in appointing Mr. J. T. Micklethwaite to the position of architect to the Abbey buildings at Westminster. His sometime partner, Mr. Somers Clarke, occupies the same position in respect to St. Paul's Cathedral, and it would have been difficult to have made a better choice in either instance. Both gentlemen are well qualified for their official positions, and, so far as the Abbey buildings are concerned, no one is better acquainted with their history or archæology than Mr. Micklethwaite. Under Sir Gilbert Scott he had special facilities for acquiring a knowledge of the great Church of St. Peter and its precincts. This knowledge he has developed, and although we are well aware that Mr. Micklethwaite takes a somewhat different view of restoration to that held by his predecessor in the office of architect to the Dean and Chapter of Westminster, we have little doubt but that he will continue to preserve the fabric and renovate its faulty or constructionally weak parts with an equally conservative care as that exercised by Mr. Pearson. To be in office, moreover, entails the advantage of being criticised, and the new surveyor to the Abbey is little likely to escape in this respect any more than his predecessors, even although he does belong to the Society for the Preservation of Ancient Buildings.

In the current issue of the *A.A. Notes*, Mr. H. Seton Morris gives the following copy of a circular which has been sent to the beneficed clergy in the diocese of———: "Revd. Sir,—Having been appointed Surveyor of Ecclesiastical Dilapidations for the Diocese of———, I have, as you will see from the above, opened offices on the first floor of———, where I purpose to carry on my practice in conjunction with my present offices at———; and trust that by careful attention, and doing my best to study the wishes of each of my several clients, I may continue to receive the honor of their confidence for future work, and their interest amongst their friends. Allow me to point out that in addition to the work of preparing plans and specifications, and superintending the execution of buildings, I take up the particular points of Arbitrations, Dilapidations, &c., of which I have made a special study. Trusting to be favoured with your further esteemed commands, I am, your obedient servant, ———, F.R.I.B.A., Diocesan Surveyor."

In the Chancery Division of the High Court of Justice, an application was recently made that the apprenticeship deed of a ward of Court should be settled by the Plumbers' Company, and a form drawn up by the company has been approved by the judge, Mr. Justice Romer. In addition to the usual provisions based on the indenture for apprentices in the City of London, approved by resolution of the Court of Common Council, April, 1889, special covenants were inserted "binding the apprentice to diligently attend evening classes of technical instruction as directed by the master under penalty of a reduction in wages, and binding the master to provide for attendance of the apprentice at the courses of instruction and the examination in knowledge of sanitary plumbing and workmanship prescribed by the Plumbers' Company or any statutory body empowered to keep a register of qualified plumbers." These covenants were introduced with the object of encouraging and promoting the apprentice's efficiency, and are novel in the practice of the City of London and the Court of Chancery.

The endowment fund of the Home Arts and Industries Association, founded by Mr. G. F. Watts, R.A., Earl Brownlow, Mr. J. Passmore Edwards, Lord Barton, and others, with the co-operation of some of the City Companies, is progressing, and now amounts to £2,595 7s., and the interest gained from this sum facilitates the work of the association. The report of the society for 1897 has just been issued, showing a gratifying progress during the past twelve months, no less than thirty new classes having become affiliated since the beginning of the year. An endeavour is wisely being made, in association with the technical instruction committees of local county councils throughout the country, to develop the class-teaching carried on by the Home Arts and Industries Association. A larger number of designs, principally of wood, metal, and leather work, have been added to the collection of the association, including a graduated series of four-

teen exercises designed by Mr. J. Phillips, of Altrincham, and some more advanced studies by Mr Arthur Simpson, of Kendal. Mr. J. Williams, formerly of the Guild and School of Handicraft, has contributed some designs for metal repoussé work. The annual exhibition of class work is to be held at the Albert Hall from May 19 to 23 next. The various agencies for furthering the advantage or amusement of young people in many villages are found to compete with the work of this association, and the falling off of attendances is attributed in some cases to the rival attractions of the fife and drum band, the Band of Hope, and other social meetings. Has not this sort of thing also been the experience at the Architectural Association, too, where the Lyric Club has so many ardent votaries? With the Home Arts and Industries local classes the difficulty referred to is a very real one, as the co-operation and grants from county councils can only be secured when an *average* attendance is maintained. This is a very proper rule, provided the average is proportionately adjusted to the size of the village or district.

Mr. Alfred Malcolm, of Clayton, read a paper on practical and theoretical lead-burning to the members of the Manchester branch of the National Registration of Plumbers at the Technical Plumbing School in that city on Friday last. Mr. Malcolm said lead-burning is more essentially a plumber's work than what is more often tacked on to his business—namely, painting, glazing, and paperhanging. He showed a piece of lead pipe unearthed at Pompeii. It is formed ont of cast sheet-lead and burnt along the edges, and he doubted whether solder would have stood the test of 2,000 years so well. The men who made such pipes were plumbers, more so than those who to-day buy all their pipes and everything else ready-made, thus reducing the so-called plumber to some extent to the level of a mere fitter. Specimens of burnt joints obtained in the vicinity of Manchester were shown to illustrate the methods in times gone by. The modern method, although now nearly sixty years old, is the use of a flame to melt the edges of the lead instead of pouring on the molten metal. Mr. Malcolm described the mode of work and practically illustrated the best process. He said the burning was the nearest approach to solid drawn work, and joints could be made that would resist more pressure than the pipes upon which they were made.

Mr. Alfred M. Fowler, M.Inst.C.E., of Manchester and Westminster, formerly borough engineer of Leeds, Sheffield, and Newcastle-on-Tyne, has been interviewed by the representative of a Manchester journal with reference to the relative merits of wood and granite paving, Mr. T. de Courcy Meade, the city surveyor of Manchester, having reported that whilst wood was noiseless, granite was impervious, comparatively inexpensive, and exceedingly durable. Mr. Fowler, on the other hand, states that the advantages of wood or asphalte more than compensate for any extra cost over granite. The wear and tear of horseflesh and of wheels should be taken into consideration; and whereas granite is dangerous to horses in all states of the weather, wood and asphalte are only so at certain times. When tramways are laid in wood-paved roads, the blocks should be, he holds, laid perfectly level with the rail, and not projecting above it. Karri and Jarrah are the best woods, he thinks, for paving: but upon sanitary grounds asphalte is, he says, *par excellence* the best material.

To encourage their apprentices to become efficient in the arts of designing and writing on wood or glass the Yorkshire Master Painters' Association offer prizes for competition each year. The classes are divided into two standards, the first being for apprentices over eighteen and under twenty-one years of age, and the second for apprentices under eighteen, but in three classes apprentices of any age are entitled to compete. The tenth annual exhibition of works sent in for competition was opened on Friday in one of the stock-rooms of the Golden Lion Hotel, Leeds. The judges were Mr. Joseph Walker, Headingley, Leeds; Mr. F. J. Pickersgill, Woodhouse-lane, Leeds; and Mr. R. Wheatley, Pontefract. They were of opinion that the specimens shown are superior to those exhibited last year, the improvement being especially noticeable in the writing, the samples of pollard oak, and the marbles. The decorated pincls and the lead-pencil designs are also very good.

The *American Shipbuilder* devotes an article to the subject of "Ventilation of Ships," which has not, till recently, had anything like the attention which it deserves. Ventilation of houses on land, though certainly important, cannot, by the nature of things, be so utterly dependent on art as is that of ships. The result has been that the atmosphere of sea-going vessels, in anything approaching bad weather, has become proverbially offensive. The bell-mouthed ventilators are, at best, only a fair-weather contrivance; they admit water quite as readily as air, and therefore, in bad weather, when they are most needed, they fail utterly. Robert Boyle's system of ventilation, however (says our contemporary), remedies all this. There is no necessity to force down the air, because it provides, as any rational system must provide, up-cast shafts for the removal of foul air, as well as down-cast shafts for the introduction of fresh air. There being now no forcing to make room for fresh air, larger quantities will naturally go in. The great cowls which retarded the ship's way are dispensed with, and, most important of all, the intakes and outtakes, though freely open to air, are impervious to water. Thus, even in the roughest weather the ventilators remain open and at work. The ingenuity of the arrangement is very great, and there is no doubt that Mr. Boyle has solved the problem of making a foul-weather ventilator. The speciality is not, moreover, one which appeals merely to the owner of gilt-edged ships; the humblest carrier of coal will find its value. For cattle-steamers and for such perishable cargoes as fruit it is very necessary, and many times the cost of an installation may be lost on a single voyage in bad weather by adhering to the other haphazard system.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Royal Institute of British Architects. Business Meeting. 8 p.m.
Society of Engineers. "Reservoir Embankments," by William Fox. Royal United Service Institution, Whitehall. 7.30 p.m.
Carpenters' Hall Lectures. "Wood-Carving: its Design and Practice," by Lewis Foreman Day. 8 p.m.
Surveyors' Institution. "Land Surveying and Valuation in Northern India," by W. Irvine. 8 p.m.
Society of Arts. "The Principles of Design in Form," Cantor Lecture No. 4, by Hugh Stannus. 8 p.m.
The Liverpool Architectural Society. "Siena and Baldassare Peruzzi," by F. W. Bedford.

Tuesday.—Society of Arts. "The Making of a Stained Glass Window," by Lewis Foreman Day. 8 p.m.
Institution of Civil Engineers. Discussion on "Alternating Current Motors" and "The Dublin Electric Tramway." 8. p.m.

Wednesday.—Architects' Benevolent Society. Annual Meeting at 9, Conduit-street, W. 5 p.m.
Society of Arts. "Linde's Method of Producing Extreme Cold and Liquefying Air," by Professor J. A. Ewing, F.R.S. 8 p.m.
St. Paul's Ecclesiological Society. "The Coronation Services of the English and French Kings," by the Rev. E. S. Dewick, F.S.A. 7.30 p.m.

Thursday.—Society of Arts. "India and Sir Henry Maine," by Charles Lewis Tupper, C.S.I. 4.30 p.m.

Friday.—Architectural Association. "Scottish Ecclesiastical Architecture in the 14th and 15th Centuries," by Hippolyte J. Blanc, A.R.S.A., of Edinburgh. 7.30 p.m.
Birmingham Architectural Association. "The B.A.A. Excursion to Tewkesbury," by John Ward.

Saturday.—Edinburgh Architectural Association. Visit to Leith Academy.
Architectural Association. Visit to Public Baths at junction of New Cross-road and Lewisham High-road. 3 p.m.

THE ARCHITECTURAL ASSOCIATION.

MARCH 11th, ORDINARY MEETING, 9, Conduit-street, W., at 7.30 p.m. Mr. HIPPOLYTE J. BLANC, A.R.S.A. on "SCOTTISH ECCLESIASTICAL ARCHITECTURE of the 14th and 15th CENTURIES" (Lantern Views).

MARCH 12th SPRING VISIT to the new Public Baths, New Cross-road, 3 p.m. By kind permission of the Architect, Mr. THOS. DINWIDDY. Entrance in Laurie-grove. Frequent trains to New Cross by Met., S.E., L.B. and S.C. Railways.

E. HOWLEY SIM, G. B. CARVILL, } Hon. Secs.

The Viceroy of India unveiled on Wednesday a statue of Field Marshal Lord Roberts on the Red-road, Mardar, near Calcutta. It has been executed by Mr. Henry Bates, A.R.A.

The Moorend Outfall Works are nearing completion, and will shortly be used in connection with the drainage of the parish of Mangotsfield, near Bristol. Mr. W. L. Le Maitre is the engineer, and the total cost of works will be about £6,000.

Trade News.

WAGES MOVEMENTS.

Aberdeen.—The annual general meeting of the members of the Aberdeen Granite Association was held on Friday evening in the North Silver-street Hall, Baillie Taggart in the chair. An application from the United Operative Granite-Cutters' Union was submitted for an increase of 1d. on the standard rate of wages, making 7½d. instead of 6½d. After discussion it was agreed to offer the men a rise on the standard rate of wages of ½d., making the rate 7d.

Bristol.—Various branches of the building trades in Bristol have issued notices asking for an advance of wages and a reduction of hours, to come into operation on the first of July next. During the past week meetings of representatives of the men have been held for the purpose of formulating their proposals, which are about to be considered at a meeting of the Masters' Association.

Coventry.—The dispute between the Coventry master builders and the plumbers and painters has been settled. A joint meeting of delegates from masters and men was held last week, at which a compromise was offered by the employers. The masters agreed to concede the men's demands of ½d. per hour increase of wages, provided that they in turn agreed to abide by the old code of working rules, which had been in force for some years, and forego the alterations then demanded. The plumbers' and painters' representatives were unable to give a decisive answer at once; but they have since written agreeing to the masters' terms. The question of the demands which the carpenters made has not yet been settled.

Leicester.—The attempt of the employers and operatives in the local building trade to arrive at a friendly agreement with respect to the questions which have been opened has so far failed. The carpentere and joiners applied that their wages should be advanced ½d. per hour, and that their hours of labour should at the same time be reduced by three and a half during eight months of the year, and by one during the remainder. The employers, on the other hand, offered a reduction of two and a half hours during certain months. At the first conference the representatives agreed to a provisional basis of settlement on the concession of the ½d. and the 54 hours week during the eight months. The trade union has since adopted this as a basis of arrangement. It has, however, been rejected by the Master Builders' Association, and no other *modus vivendi* has been arranged. The formal notices of the workmen do not expire until the close of the present month, and there is thus time for conciliatory counsels to prevail.

Plymouth.—The journeyman painters and house decorators of Plymouth having made demands for an increase of wages and shortening of working hours, a conference has taken place between the employers and a deputation from the Amalgamated Society of House Decorators and Painters. The result is that in future the men will be paid 7d. per hour, and work will cease at 12 o'clock on Saturdays and at 5.30 on other days, on and after to-morrow (Saturday).

Tunbridge Wells.—The house painters of this town have made a compromise in the matter of a demand of an advance of 1d. an hour in wages, from 7d. to 8d., and thus a probable dispute has been averted. Although the Masters' Federation has been practically dissolved, the leading firms severally have offered to the employés an advance of ½d., and at a general meeting of the trade (society and non-society men), convened at the Friendly Societies' Hall on Wednesday week, the proposal was accepted.

A pipe-organ, erected by Messrs. H. S. Vincent and Co., Sunderland, was inaugurated on Sunday in the Buccleuch Street United Presbyterian Church, Dalkeith.

The Rowton Trustees have purchased a freehold site at Hammersmith, on which they propose to build a fourth lodging house for men, similar to those in Vauxhall, King's Cross, and Newington-butts, to contain 600 beds.

The new board schools which have been erected at Carnarvon, on a site adjoining the Pavilion, were opened on Tuesday. The cost of the building is about £6,000. The architect was Mr. Rowland Lloyd-Jones, Mr. Owen Morris being the contractor.

A new Wesleyan chapel, Early Perpendicular in style, and seated for 624 persons, has just been built at Barry, at a cost of £3,400. The walls are of Newbridge stone, with Bath stone dressings, and the roof is in one span, the roof-trusses being carried by pilasters of Bath stone. Mr. Budgeon, of Cardiff, was the architect, and Messrs. Evans Brothers, of the same town, the contractors.

LIST OF COMPETITIONS OPEN.

Peterborough—Additions to the Old Guildhall (limit £2,000, exclusive of fittings and furniture)	£25 (and 5 per cent. com.), £15, £10	W. Wellows, Town Clerk, Guildhall, Peterborough	Mar. 7

CHIPS.

On the motion of Sir W. Walrond in the House of Commons on Wednesday, a select committee was appointed to inquire into and report upon the administration and cost of the museums of the Science and Art Department.

Three stained-glass windows have just been placed in St. Martin's Church, Lowmoor. The subjects represented are "The Holy Family," "Ruth," and "Dorcas." The work is from the studio of Messrs. Abbott and Co., Brock-street, Lancaster.

On Saturday the memorial-stone of the new United Presbyterian church, at present in course of erection on the grounds of Rossbank, West End, Camhuslang, was laid. The buildings consist of a church to accommodate 758, to cost £4,900; church officer's house, to cost £300; also halls, vestry, managers' room, &c., to cost £2,000; total, £7,200.

A special meeting of the Tewkesbury Corporation was held on Monday, under the presidency of the Mayor, when it was resolved that Mr. W. H. Gray, the surveyor, who has been missing since Saturday, be discharged from the appointments held under the council. It was also resolved to advertise as vacant the appointments of surveyor and inspector of nuisances until May next, when the annual appointment is made, at a salary of £100 per annum, but the proposition was withdrawn. The finance committee was empowered to perform the duties of surveyor, and Mr. Leicester, chartered accountant, of Worcester, was appointed to audit the borough accounts. Mr. W. H. Gray has been borough surveyor of Tewkesbury for the past twenty-five years.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

Barking.—For shops at Barking. Mr. F. S. Hammond, architect:—

Lark and Son	£5,096	0	0
Shurmur	5,015	0	0
Johnson	4,992	0	0
Gibb	4,400	0	0

Bethnal Green.—For erection of the Cornwall Arms p.h. and two cottages, Bethnal Green. Mr. W. J. Ingram, architect:—

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXXIV.—No. 2253.
FRIDAY, MARCH 11, 1898.

CRAFT INDEPENDENCE.

THE engineer and architect are often brought into close relationship; but for certain reasons, obvious and otherwise, they still retain their individual preferences—that is to say, the wall of separation is not easily broken down, and a sharp line appears to divide the two vocations. One of the strongest reasons for this separation is probably the fact that both must live. It would hardly do for architects to invade some of the fields of the civil engineer—hydraulics, sewering, or railway engineering, though in ancient times and the Middle Ages they did so; nor, on the other hand, would it be agreeable, or, in the nature of things, right, for the engineer to pose as a designer of buildings, domestic or public. Things have changed so much that an engineer's idea of architecture would, we fear, be rather "mixed," or, shall we say, too decidedly prosaic to suit most people. And yet it has been asserted by a good authority on the history of architecture, that the modern engineer's work is a great deal more entitled to be called real architecture than that of the architect; in short, that the engineering work of the age is nearer to the true spirit of the art, as being an embodiment of our requirements. That honest construction, which expresses every function directly without disguise or concealment, is the basis of good architecture must be conceded, and in this respect the engineer sets an example to the ordinary architect, who is content to adopt a style or to imitate a leader. But there is an element in design which the engineer has not as yet been able to discern, and that is human sympathy, or that element of pleasurable emotion so necessary to a work of art. If he could only understand or appreciate this desire, his work would be real architecture. For the lack of this, his designs fail to commend themselves to the popular eye. They are hard and unappreciated. And the modern engineer is in no mood to satisfy this longing; he prides himself on his science and technical skill, and rather exaggerates the qualities of mechanical cleverness and magnitude. This is probably one of the reasons why his relation with the architect is not the pleasantest.

Let us take, for example, one kind of engineering work which is closely connected with the design of the architect—structural ironwork of a commercial kind. It is most likely the architect's design has been made without reference to a particular estimate. The engineering firm have to tender for the work to be done, and are required to prepare their own quantities and specification as well. Virtually, the architect leaves the matter in their hands. There are wrought and cast-iron columns or stanchions, wrought-iron girders, fireproof floors and roofs—matters involving calculation of loads and stresses. The architect rids himself of the responsibility to some extent, but at a serious sacrifice of architectural solidity or merit. The manufacturer is unwilling to learn anything beyond his pattern-book, and the sections which give the greatest strength at the least quantity of metal. With him everything is weight. The architect specifies certain sections of columns, of stanchions, and iron joists; but the details of workmanship, about which he knows very little, are left to the manufacturer. The effect of these conditions is to make the architect dependent on the manufacturer, and for the latter to dictate the details of the work. Of what use is it for the architect to make designs and working drawings of certain ironwork, and find that the iron merchant is not willing to tender on those drawings? The latter knows that iron construction must be used, and is master of the position, and does much as he likes. Special designs of the architect can stand little chance against the market prices and patterns, which crowd the catalogues of the modern tradesman.

We have been speaking of constructional ironwork; but for ornamental wrought-iron work the architect has it all his own way. That there is something inconsistent with the treatment of the material goes without saying. The principle of hammered work is sometimes lost sight of, and very ornamental designs are made quite out of character with the material. In this branch of craftsmanship the architect may yet learn something. Then we have leadwork, about which Mr. F. W. Troup, A.R.I.B.A., discoursed the other day at the Architectural Association. Who that has been to any of the old French, German, and Flemish cities like Bruges can have failed to see what an important detail ornamental leadwork was? The Mediæval architects relied much on it to give point to their buildings, as wrought iron was used to decorate brick fronts. Mr. Troup's remarks, which we reported last week, are of interest as pointing to the durability of cast over milled lead in roof-work; its superiority for ornamental work, for pattern embossing; the harder quality of old over new and purer lead from which all other metal, like silver, tin, iron, &c., are abstracted; the excess or misuse of soldering in modern leadwork and overclose dressing of lead over woodwork. The remarks on the proper ornamental treatment of lead in pipe-heads, coffers, cisterns, spires, finials, and ridges, many examples of which Mr. Lethaby has given us in his recent work on "Leadwork," ought to be taken to heart by architects who have too long left lead and all its works in the hands of plumbers. No doubt the reason is obvious: architects have not taken the trouble to learn the capabilities or possibilities of the material; they have so long been associated with stone and stucco and wood that all other materials have been allowed to remain in the hands of engineers and plumbers. And so it is with other trades: they have become mechanical simply because architects will not master them or the materials. Structural engineers, plumbers, and smiths work in them without any feeling or sympathy. All freedom in treatment is gone; the workman tries to follow the architect's design line for line, but in so doing the whole spirit is lost. Even workers in iron and lead know how impossible it is to give the architect's meaning, or to produce a particular detail or effect.

In sanitary work, again, the architect has to give in much to the engineer and plumber. It would be simply impossible to expect the architect to know perfectly the technical details of a cooking apparatus, or even to specify the requirements of a large hotel in detail without consultation. Then, again, with the heating engineer, the trade is left to the specialist—who takes care to keep in his own hands the systems of heating buildings. Nor would we expect an *entente cordiale* between the architect and the mechanical and hydraulic engineer, or even between the—horticultural engineer and electrician all of which branches of engineering are now separate and distinct crafts which have no reference to architectural design. Yet they hamper and impede the designer of a building. Each has its own rules and trade regulations, which generally conflict with the architect's notions; each has its own conventions and modes of treatment, and to try to bring them to any common understanding is an impossible task. With every invention and building improvement the architect is brought face to face with a new form of engineering which he has to boldly meet or compromise with. Discretion is often the better part of valour, to find a solution and try to reconcile what seems irreconcilable. Exceedingly distasteful and obnoxious it must be for an architect to give up his solid moulded wood beams for fireproof casings of metal lathing and plaster, or to study the electrician's requirements before he designs his wall decoration and ceilings, or the ventilating engineer's exhaust shafts; but it is better to make room for them quietly than to fight against the inevitable. The domons of cheapness and fashion are the greatest enemies to the architect, and these can only be vanquished when he learns to win them over by timely concession.

MODEL SPECIFICATIONS.—III.

EXCAVATOR AND DRAINAGE.

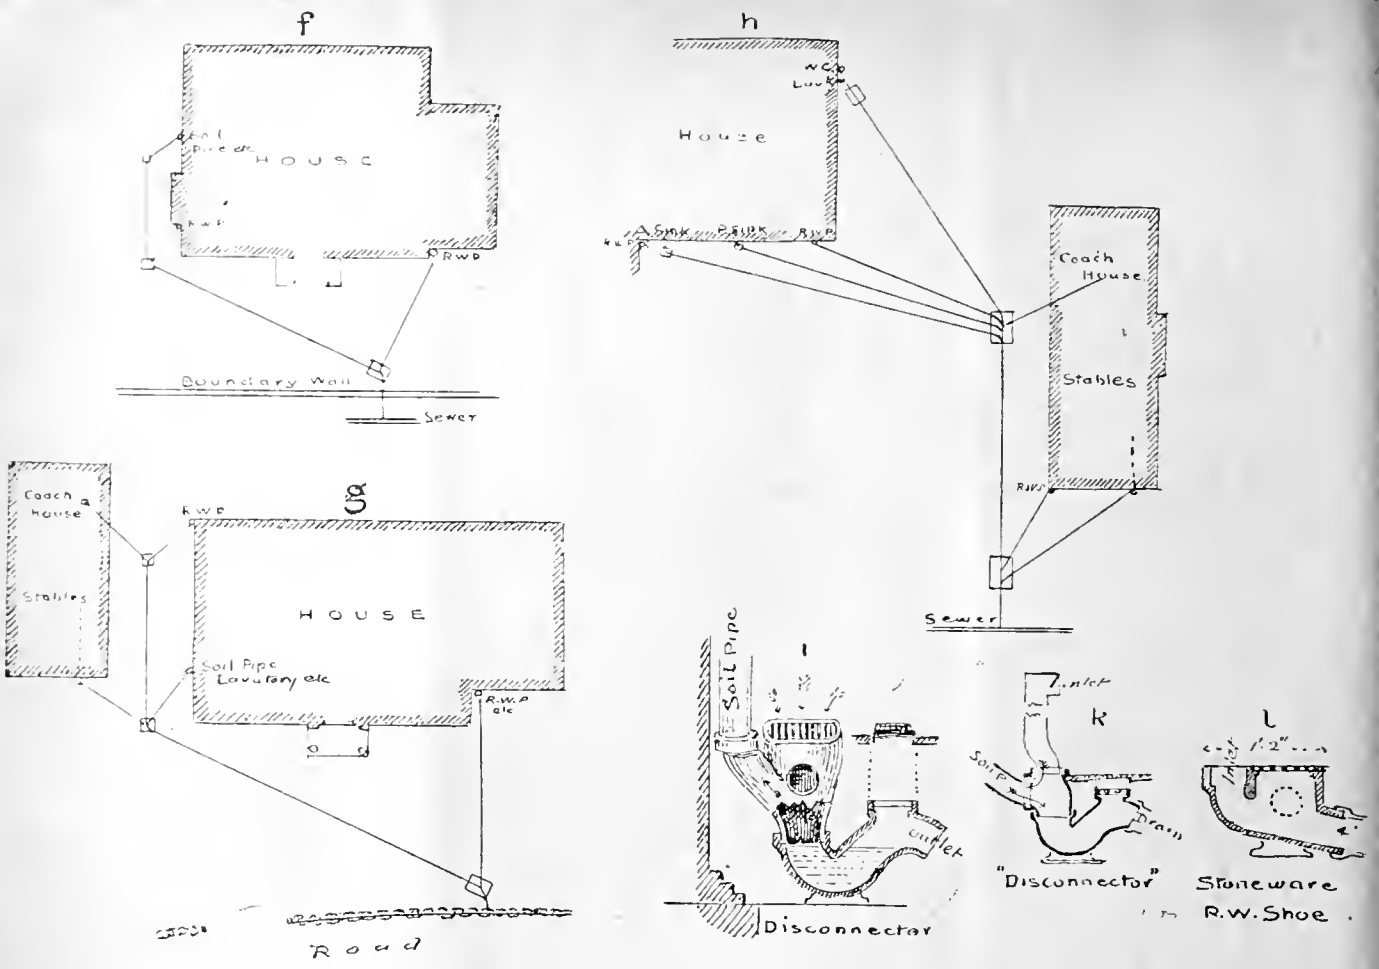
THE clauses we have given for the Excavator are those which apply to ordinary buildings; but, of course, there are special circumstances in certain cases. It is usual in clauses for excavations to name some distance for removal of soil or earth—usually 20 yards; if it is wheeled beyond this distance, it is desirable to state how much Also if the excavation is deeper than 5ft. or 6ft. Upon these data the charge for carting, &c., mainly depends. In most trades, as we have remarked, there is a general sequence, and the clauses we give will generally begin with the simpler and commoner kinds of work, and then proceed to the more complex. In this particular trade the earlier clauses relate to superficial digging, as taking off the top soil not exceeding, say, 12in. in depth over the whole site; then to deep excavations for basements, for which timbering to support the sides of the excavation may be necessary; and the same difference is observed between digging and carting to trenches; and digging, filling, and ramming, a portion of the earth being left aud returned for the latter purpose.

Much may be said on shoring, strutting, and waling to the sides of trenches and excavations; but the reader is referred to the handbooks on building construction. We show two sketches of ordinary trench-work. In every case it is necessary to describe the nature of the soil—whether clay, loam, gravel, sand, &c., as upon it the necessity of strutting, &c., entirely rests. In well-drained land, earth will stand in embankments about 1½ to 1.

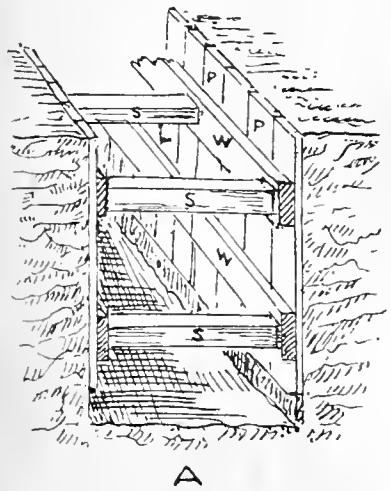
For large excavations, steam excavators are employed, and a 10-ton locomotive steam crane excavator with 1½yd. digging bucket is stated to excavate and deliver into waggons from 800 to 1,200 cubic yards per day of 11 hours, according to nature of ground.

DRAINAGE.

The subject of drain-laying comes under the general head of "Excavator." It is necessary for the specification writer to understand the modern system of sanitation and pipe-laying. In this system the "disconnecting manhole," or "access chamber" as it is sometimes called, is an important detail. We refer the reader to many of the sanitary handbooks on this subject, and confine our attention to a few details. Practice varies as to the mode of construction of manholes, but there are a few points to be observed. Some authorities say that the "disconnecting manhole" should be at a distance of about 70ft. or more from the house; but this is impossible in ordinary buildings in towns and suburbs, and the manhole is generally placed a few feet from the house, the chief consideration being that it intercepts or disconnects the main sewer from the house drain, and is built at the house end of the siphon trap. The chamber may be for ordinary houses about 3ft. square



or 3ft. by 2ft. (see sketch C), and be built of 9in. brickwork, finished with cement, the walls and chamber being laid on a bed of concrete. A straight, open, half-pipe or white glazed channel of stoneware is laid in this concrete bottom, bedded in cement on the socket of siphon-trap (see sketch C, last week). On either side branch pipes from the wastes and other pipes may be made to join it at an easy angle or curve, discharging also through

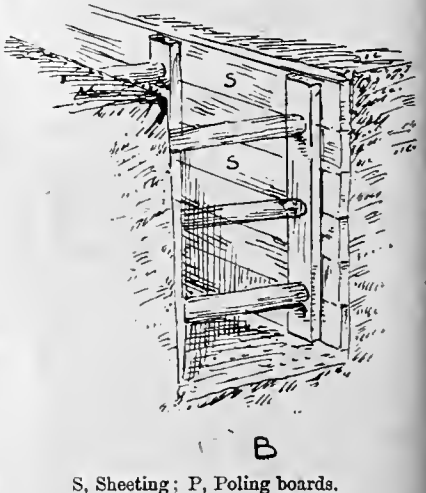


W, Walings; P, Poling boards; S, Struts.

open glazed stoneware channels into the main central channel, so that the drains leading from them may be cleared if any stoppage occurred. When these half-pipes, or glazed open channels, are laid, the concrete should be made up round them on each side, battered up to the chamber walls on three sides, and the surface smoothly rendered over with cement, made flush with the inner surfaces of the channels. The walls are also cemented or faced with glazed bricks, and an iron airtight cover put over the manhole. The detail is shown in our sketch (p. 296). The house-drain, by which we mean the length of drain between the soil-pipe foot and the "disconnecting manhole," as distinguished from that from the latter or siphon-trap to the sewer, or "connecting drain," should be laid in a straight line from first inspection chamber to the disconnecting manhole; or if it must be in two lines, it should be laid straight to the "turning chamber" and thence to the disconnecting manhole (see plan *b*, p. 296), so that the house-drain can be cleared from the latter. If the house-drain passes under the house, as in town houses, it should be quite straight, and be bedded in concrete at least 4in. in thickness; no branch drain should be connected to it. Whenever a change of direction in the drain is required, a turning manhole should be made at that point, and an open glazed channel must be laid in it (see *e*, p. 296). The 4in. house-drain should be laid to a fall of 1 in 30, a 6in. drain to a fall of 1 in 40, and a 9in. to a fall of 1 in 60. The connecting drain between disconnecting chamber and sewer is determined by the length and depth of sewer. We give plans of drainage for country villas and stables (sketches *f*, *g*, *h*) which explain themselves, and diconnecting traps for soil-pipes instead of manhole as described. K shows a good form of trap in lieu of diconnecting manhole; C is a R.W. shoe for the feet of rain-water pipes, &c.

True gradients must be observed from chamber to chamber, and these, if for inspection or disconnection, should be about 2ft. by 3ft., their depth varying according to circumstances, and have, as said above, open-channel inverts and fresh-air inlets. For jointing pipes, several patent self-adjusting arrangements for uniting the spigot and socket ends are in the market. Doulton's "self-adjusting joint" leaves little to be desired, as the composition cast on the spigot is spherical, and allows a slight deflection to take place. The concentric fitting secured by the "Stanford joint" and the "Tyndale" patent, a double-seal joint, the "Patent Paragon," "Sykes" screw joint, have each merit. If cement joints are used, they should be wiped out as the work proceeds.

The Local Government Board By-laws provide that there shall be on the line of



S, Sheeting; P, Poling boards.

each drain "two untrapped openings," one opening being on the house side of the disconnecting trap, and the second on the top of drain or soil-pipe end.

Notice should be given to parish and other authorities for connecting house-drain to sewer, and the drains should be left open for the inspection of local authorities.

Maxims in Drain Laying.—All junctions should be made at a manhole. Main pipe-drains should be laid in straight lines, and have gradients from manhole to manhole.

All junctions should be made with a curve. Drains of unequal section or diameter should not join with level inverts; the lesser should have a fall into the larger equal to the difference in the diameters. A ventilating pipe from the interceptor trap, just where the drain enters the house, should be provided in order to disconnect sewer gas from house, and this should be carried up to the roof level, finished with a cone or one of Boyle's extractors.

We may name a few intercepting traps well known in the market:—Mansergh's external house protecting drain-trap with iron grid; Weaver's ventilating sewer air-trap; Sykes's patent sewer-gas interceptor, with fresh-air inlet and sewer-gas outlet, and inspection inlets with screw stoppers; Jennings's ventilating cesspool traps; Hellyer's patent ventilating drains, siphon, and sewer interceptor; also his combination drain-trap or disconnector with galvanised cast-iron gratings; Winser's intercepting sewer-trap; Hayward's airtight inspection-covers to drains. (Plans *b*, *f*, *g*, *h*, &c., illustrate these traps.) The following are the usual clauses for drainage:—

1. *Drains.*—The drain-pipes to be the best (or salt) glazed stoneware socketed pipes of approved make (or Doulton's "tested"), hard, sound, perfectly straight, cylindrical and smooth inside, and free from flaws, with all bends, tapers, junctions, and other connections, and to be laid in straight lines to regular falls from the soil and waste R.W. pipes to the inspection and disconnecting chambers, as shown on plan (see *b*, *f*, *g*, *h*). The pipes to be of the following diameters: the main house-drain from soil-pipe to disconnecting chamber to be 6in. internal diameter, and of about 2ft. lengths; and the other branches from wastes and sink to be 4in. pipes.

Testing.—The contractor will be required to test the drains in the presence of the architect or clerk of works by filling them with water, proper plugs and other necessaries being provided for the purpose, and the drains are not to be covered in till this has been done and approved.

Cement Joints.—The pipes to be jointed in neat Portland cement (or mixed in proportion of one part cement to 3 parts of good, clean, sharp sand by measure), taking care to wipe out the inside as the laying proceeds. They are to be laid (or incased) in concrete 6in. thick (the concrete to be 7 to 1). Form round each joint a fillet of Portland cement 3in. wide. Or—

The drains to be of A form [show section] or B form, laid in a bed of concrete 6in. thick the full width of trench, and the pipes jointed together with Portland cement (or, to have Doulton's or Stanford patent self-adjusting joint). Or—

The stoneware pipes to have Stanford's patent joints. Clean spigot and sockets of pipes, and then apply hot with a brush a preparation of Russian tallow 2 to 3 parts to 1 of resin to the joints; wipe the inside clean, and draw a pad through each pipe as it is laid. A fillet of neat Portland cement to be put round each joint outside.

2. *Bedding in Concrete.* — All drain-pipes under buildings to be incased in cement concrete 4in. thick (or 16in. by 16in. for 4in. pipes, 18in. by 18in. for 6in. pipes), and the open channels and branches in manholes to be imbedded in concrete sloped down to them.

It should be noted here that the body of the pipe is to be laid on a bed of concrete, the latter being cut out under each collar to allow space to make the joint.

3. *Inspection Chambers.* — Build the inspection chambers, of the sizes shown on plans, of one brick in thickness in cement, with one course of footings on a bed of lime concrete 12in. thick, and oversail top courses if necessary. Form concrete bed to receive centre open channels and branches, as shown in sketches C and E.

Disconnecting Manholes.—The disconnecting-chamber to be built, as shown (sketch C) on plans, with Crapper and Co.'s "Improved Kenon" trap (or other approved siphon with sweeping arm and caps set in mortar), and 6in. fresh-air inlet. The interior to be lined with 4½in. brickwork in cement, (or to be cased with white glazed bricks). The bottom to be of cement concrete, in which are to be bedded in cement Crapper and Co.'s (or Doulton's or Duckett's) enamelled stoneware channels and bends. The surface of concrete to fall towards the open channels, and to be rendered with Portland cement to a smooth surface. Cover manhole with Crapper and Co.'s (or Hellyer's) galvanised-iron air-tight covers set in cement of the size shown. Or—

Execute the brickwork to manholes and chambers with stock bricks (or glazed facing bricks) laid in cement mortar on footings upon cement concrete foundation. Point the brickwork on both sides as the work proceeds. Or—

Build disconnecting manhole 3ft. 6in. by 2ft. 6in. in 9in. brickwork on proper footings upon cement concrete foundation over the whole area. Insert at the outlet end a (one of Doulton's, Field's, or Duckett's) 6in. stoneware siphon intercepting trap with 4in. cleaning branch and cap. Bed in concrete 6in. white glazed half-pipe and 4in. half-pipe bends, as shown; form the sides and benches in concrete, and render in neat cement. Put a 6in. air-inlet pipe where shown, and cover manhole with a 2ft. by 18in. cast-iron cover and frame with indiarubber seating, let into York curb.

The open channels or half-pipes should have a fall of 3in. in their length, and the sides should be formed up in concrete some inches above sides of pipe, and the benches should be sloped and rendered in neat cement.

We have given several different specimen clauses. Very often in the case of ordinary houses a cheaper plan is to have a disconnecting trap only, without the chamber, and many of these are in the market. Doulton, Dent and Hellyer, Duckett, and others manufacture excellent intercepting traps, two or three of which we illustrate. We may provide any of these as follows:

4. *Disconnecting Traps.* — At the foot of bath, lavatory, and sink waste insert one of Dent and Hellyer's "Waste Receivers" (or Doulton's). Or—

"Disconnecting" traps as shown on sketch, bedded in concrete with iron grid. Or—

The soil-pipe to have at the foot one of Dent and Hellyer's "Combination" or "Disconnector" traps as shown *i* and *k*, with galvanised iron grid 9in. long, and loose stoppers for stopping holes. The trap to be bedded in concrete, &c.

5. *R. Water Shoes.*—Put at the foot of every rain-water pipe one of Dent and Hellyer's (or Doulton's) patent stoneware shoes (see sketch *e*) bedded in concrete, with a 9in. by 9in. close plate cover, let into a rubbed or tooled stone curb.

Grease Trap. — Put one of Doulton's (or Hellyer's or Winser's) 12in. flushing gully, bedded in concrete (see sketch). The flushing tank (if any) to discharge into this gully. Provide iron grid on stone curb.

(Nots.—When the trap is deep a pipe shaft for ventilation can be brought up to level of ground; the inlet has a perforated top.)

Or the following clauses may be used:—

Put Duckett's automatic grease collector and flusher with four-gallon tipper to all sink wastes.

Put one of Doulton's patent "gully channels" for waste-pipe from sink or bath with wire cover set in cement concrete where shown.

6. *Gully Traps.*—Several sorts of gully traps are patented. The clauses for these may run:—

The gullies to be Doulton's yard gully (or Hellyer's R. water interceptor) with 4in. inlet for rain-water pipe, with 8in. square top, bedded in concrete 4in. thick. Or—

Provide Doulton's (round or square) yard gullies, with bend for rain-water pipe bedded in cement. Or—

The gullies at the feet of waste pipes to be Duckett's patent "self-cleaning channel," and those for rain-water pipes to be the same maker's trap and dish-brick with hinged grate. Or—

The gullies to be of an approved kind with galvanised iron grids, fitted in rebated York curbstones, with 4½in. brick-built pits in cement of the necessary depth, rendered inside with cement.

Bed in Concrete.—The feet of all soil, rain-water, and other vertical pipes to be bedded in concrete, and be connected in a manner approved to all traps.

To prevent evaporation of seal, a gully-trap should have a sink-waste discharging into it. In dry weather this prevents the evaporation of water, and it is desirable when there is no manhole that it should have a cleansing branch and cap, as shown in sketch.

Referring again to disconnection of house-drain from sewer, a 6in. pipe shaft—such as Hellyer's—can be carried up from the drain-trap, which may be at some depth, and terminate with a suitable inlet for admitting fresh air to the house-drains. Many stoneware traps are made with an open head for continuing such pipe-shaft upwards, and having another opening or inlet, which can be turned to any direction for a branch to enter. The inlet is generally made in a separate piece to the body of trap.

Sometimes it may be necessary to insert a clause of a general kind, thus—

7. *General Clause.*—All the glazed stoneware drain-pipes, interceptors, and gullies to be Doulton's (or Duckett's, &c.), to have Doulton's (or Stanford's) self-adjusting joints or "composite" joint. Insert at every bend or junction Doulton's patent junction or access pipes, with stoneware covers; and at all manholes lay in concrete channel-pipes, the joints between the channel-pipes and brick-work to be carefully made in cement (or Doulton's "Registered channel-pipe" to be used), &c.

ARCHITECTURE AT THE ROYAL SCOTTISH ACADEMY.

THE seventy-second exhibition of the Royal Scottish Academy, recently opened, has 799 exhibits, which is a somewhat bulkier collection than that of the year preceding, owing, doubtless, to the smaller number of large pictures and portraits. The arrangements are the same as for a few years past, and everything has been done to improve the appearance of the rooms and make them attractive in every way to the public. The loan department does not contain any such interesting pictures as those of last year by the late Sir J. Millais, and there is no picture of such outstanding interest as to be likely to attract a crowd. The water-colours are in the South Room, as before, and architectural and other etchings are in the small octagon. 642, by R. B. Johnston, is the perspective of the interior of the Baptistery of Siena Cathedral, which gives an excellent idea of the building and its decoration, mostly in blue and red. The font is an imposing structure, more in the style of the memorial fountain, the basin being a large octagonal pouch, with plain structural detail, but elaborate carving on its panels, and from the centre rises a lofty octagonal tarret and spire. 660, "The Old Tolbooth, Kirkcudbright," by Marian Ancrum, shows an old Scotch tower with corbelled parapet and high flight of steps to give access. The rest of the building to the street is commonplace. 717 is a very nice sketch of "A Bit of St. Andrew's Cathedral," by W. Proudfoot. There is not much more than a bit left of the whole, and the one represented is not inconsiderable. It shows the broken surface arcading of the walls of what seem to be the chapter-house. The detail of the Norman architecture is apparently much the worse for weather. 755, "Crathes Castle, Aberdeenshire," by J. G. Laing, is very picturesquely sketched—a small corner of the main building, only visible through a long vista of ivy-mantled walls. The house is of many stories, with old Baronial detail. 765, "A Cloister in Holyrood," by C. P. Ross, is well delineated in the draughtsmanship, but lacks softness and harmony in the colour. 772, "The Enchanted Castle," by James G. Laing, is a very attractive subject, and represents probably, with some imaginative alteration and addition, a real castle. The twilight gloom rests on the landscape, which has a bridge in the middle distance, and a rider with lance crossing to the tower at the other side of the moat or river. The details of the architecture are fanciful; but the well-known Scotch turret plays a good part in the composition.

The Water-Colour Room, as a whole, has not many interesting subjects. 691, "Return to Hawick from Horn's Hole, 1514," by T. Scott, has a crowd of figures on the canvas, all very carefully studied, to represent the parties meeting the survivors of Flodden. The blue blanket has a conspicuous place.

The sculpture has about fifteen subjects. 394 is "Sketch Study for Colossal Statue of James V. of Scotland," for the National Portrait Gallery, by Birnie Rhind. The niche is also modelled, with the carved bracket below, and the figure has a very good presence, and is clad in the proper style of the period; but some other notable might have been more worthy of the conspicuous position assigned to him, who left nothing to mark his history but an untimely death.

The architectural exhibits are not numerous, and the names of some regular exhibitors are conspicuously absent. Mr. Honeyman, Mr. H. Blanc, and Mr. Leiper are the only Associates who are represented, and the only one by Mr. Blanc is 571. "A View of Christ Church,

Morningside," erected many years ago. The drawing is a very fine sepia perspective to a large scale, showing to advantage the somewhat over-elaborated detail of the chancel, and the fine tower and spire which is the feature of the neighbourhood. 558 shows two "Elevations of Designs for Belfast Town Hall," by Messrs. J. Honeyman and Keppie. It is an etching of a large building with extended frontage, and central square with dome. The details are plain Classical, and the drawing is made with very heavy lines, which does not improve it as a picture. The dome looks rather small and pinched, probably from the heavy surroundings at the lower part, or its receding to suit the square structure beneath. 586, "Proposed Restoration of Brechin Cathedral," by the same—view from the north-east—is a water-colour sketch to a good scale, and shows a complete Mediæval church of Early English, with earlier and later developments. The square tower with embrasured parapet stands at the north side of the nave. The clerestory has only a few small lancet lights, but the aisle large triplets, and a north porch with deeply-recessed doorways. The choir or chancel is lofty, without aisles, with parapets and gargoyles and five lofty lancets, and priests' door below them, near the east end. The east gable is treated with octagonal turrets, rising out of massive buttresses. The round tower on the south side is not seen. 592, "Design for Paisley Technical School," by the same architects, shows an extensive Classical front, with large circular projection in the centre, a broad zone of sculptured ornament making up for lack of windows. The details are those of the usual Classic work. 566, "Viewfield, Stirling," for Mr. W. Renwick, by W. Leiper, R.S.A., is picturesque treatment of a large mansion house in the Scottish Baronial style. There is much variety in height of roof and arrangements of plan, with angle turrets of large proportions and dormers. A range of lower building to the left gives dignity to the highest portion of the design, which must have a ground plan of considerable extent. The entrance is in a projection running in line with the front of the principal part of the building, and behind it is a lower building of two floors and the dormers. Mansion houses, large and small, bulk largely this year. 564, "An Architect's House, Ayr," by James A. Morris, shows a long ground plan, with rooms all on one side and passages on the other. It is designed in the half-timber upper-floor style, with red-tile roof, and with very small windows of irregular size, going, indeed, to the opposite extreme, for which buildings in this style are generally notable—viz., their spacious windows 573, "Proposed Additions to an Old Scotch Mansion," by Messrs. Leadbetter and Fairley, seems to be an extensive addition on one side of a building, and forming a third side, inclosing a square plot. The "auld house" has been a very plain one externally, and the addition could be nothing else to be in keeping. A hall, drawing-room, and entrance appear to have been but ill provided for before. 577, "Eccles, Berwickshire," by the same architects, is a perspective in a different style of an entirely new edifice somewhat in the bungalow style, being a lengthy and low stretch of building of two floors, with deeply overhanging eaves, and hipped or pavilion roofing. The elevations shown are pleasantly relieved by various projections, which completely save the whole from the commonplace aspect of the style. Conspicuous features also, with similar result, are the numerous chimney stacks rising on the front walls, and a large octagonal projection in the centre of same elevation has a happy effect. 575, "Dalskairth House, Dumfriesshire," by J. A. Campbell, is another large mansion, with conspicuous central tower, and other usual details of the Scotch Baronial. 585, "Millhills House, Perthshire: Additions and Alterations," by J. M. Henry, is a building of inconsiderable height in the Scotch style, with corbelled gables. 554, "Briglands, Kinross," by R. S. Lorimer, is an edifice of moderate size, in ground plan in form of an L, with a court in the angle, inclosed with balustrade in front, to which access is had by a handsome staircase down to its ground-floor level. The door is rather close to the re-entering angle, and generally the windows are very irregular in their size and arrangement. It is a plain building of three floors. 570 is a water-colour sketch of "Lady Stair's House, Lawnmarket, as restored for the Earl of Rosebery." The drawing is a faithful perspective of this great improvement to the neighbourhood; but it looks too much alone, and the surroundings, which are contignous, are represented as very far away. 560, "New Printing Works, McDonald-road," by Cooper and Taylor, is a fine specimen of street architecture. 563, "Two Views of Boarding House for Boys at Edinburgh Academy," by A. N. Paterson, is a water-colour, showing a large building of two floors in red stone, building in Inverleith-place. 571, "Premises in Queen-street," by J. Jordan, is also a good sample of street architecture, breaking up the monotony of this old New Town architecture. 572, "Parish Council Offices, Aberdeen," by A. M. McKenzie, is a Classic design, and shows a building of lofty proportions, with large windows, and well-proportioned details. 588, "Duddyston Golf Club-House," by Messrs. Cooper and Taylor, shows a very long elevation, with a sort of square tower about the level of the eaves at one end, a plain pavilion at the other extremity. 543, "Competitive Design for Englargement of Lerwick School," by J. A Carfrae, is a small addition evidently to a plain edifice. 555 is the accepted design for Kirkaldy Burgh School Board, by W. Williamson, jun. This is street architecture, with large circular openings on ground floor, apparently fitted up as shops, with the offices above.

Church designs are very scanty. 559 is a water-colour of "Mayfield U.P. Church in Fountainhall-road," by J. E. Fawley. It is drawn to a very large scale, and is evidently a design with nave, transepts, and shallow passage aisles. But it seems of good proportions as to length—in Early Gothic style—with rather much in the way of heavy buttressing, to make up, perhaps, for the absence of the spire. 587, "Proposed Free Church, Thornton, Fifeshire," by W. Williamson, jun., is too like a parish hall, with lintelled and Gothic windows. 569, "Proposed Decoration in Marbles of the Jesuit Fathers' Church in Lauriston," by E. A. McPherson, is a masterpiece of interior perspective and colouring. The chancel of this church has been enlarged, and it cannot any more be quoted as an example of the want of architectural taste for which most of the Jesuit churches are noted.

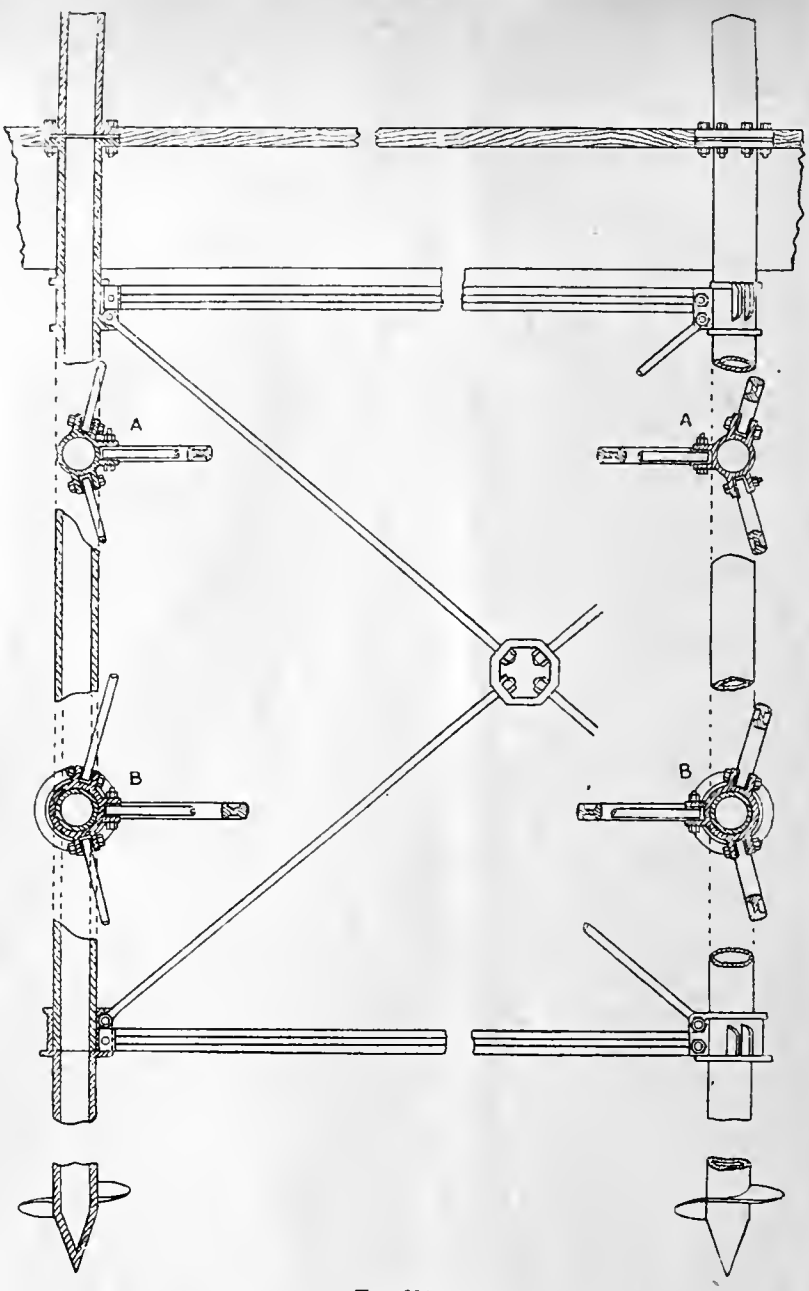


Fig. 234.

WROUGHT-IRON AND STEEL IN CONSTRUCTIONAL WORK.—XXXIV.

THE introduction of cast iron to any important extent into wrought-iron and steel structures is generally deprecated, and it is therefore employed in a much less degree than formerly. Even for struts, for which it is well fitted, it has been mostly discarded; and though once much used to effect the union of the bars composing iron roof-trusses, its place is now taken by pieces of plate, angle-irons, and other sections. There is yet, however, a considerable margin for the employment of cast iron in some minor details. The general methods by which the malleable work is attached to the cast may be considered in this article.

It must be laid down as a rule, to which there

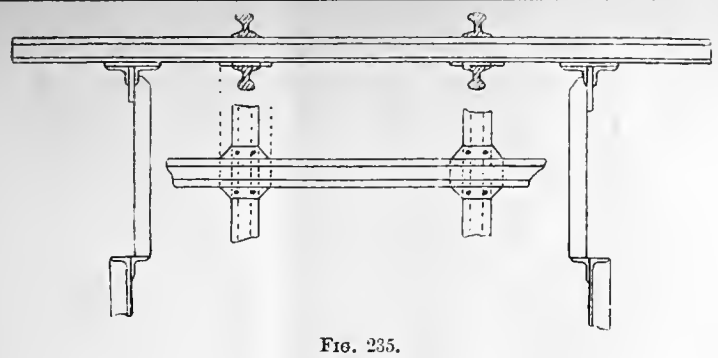

Fig. 235.

are few exceptions, that any method of attachment should not put the cast metal into tension. When this is unavoidable, then very ample margin must be made, and this means the employment of unsightly masses, ill in harmony with the light appearance of the main structure.

Another point is, that rivets are not suitable means of union between wrought and cast iron.

In parts which are sensibly affected by differences in temperature, rigid cast-iron connections are quite unsuitable, unless means of affording compensation are adopted. Provision for expansion and contraction in steel work does not seem necessary in any constructional work except long bridges. Provision is not usually made in the case of roofs, even though of large span.

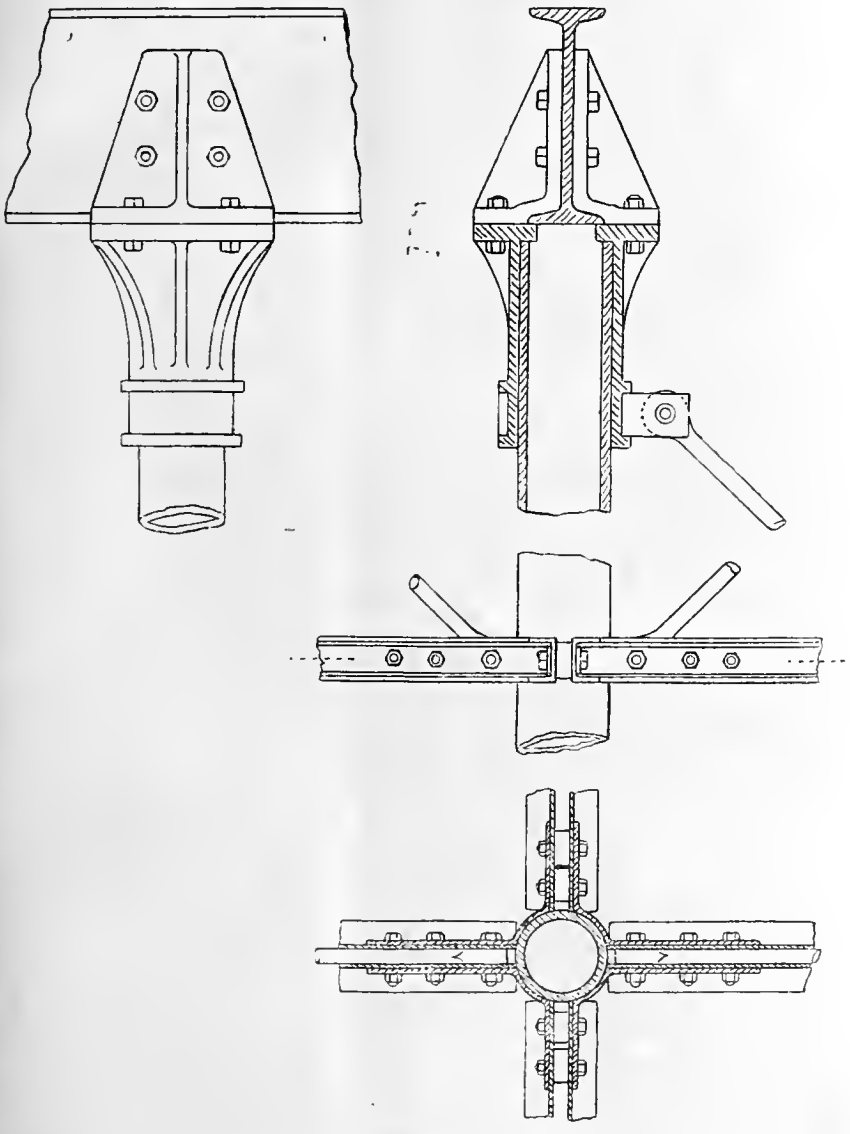

Fig. 237.

The closing of the rivets is likely to fracture the latter, especially when holes come near edges and corners. Only in the case of thick castings, of over, say, 1in. or 1¼in. in thickness, can rivets be employed with safety.

The place of cast iron is in sections which are not subject to severe stress, or in parts where the stresses are compressive only or principally, and in the case of light details of a rather intricate character, which would be troublesome to form by building up in plate and angle or other sections, and, of course, in large masses. All these occur in many classes of constructional work.

When cast-iron lugs are used as attachments for wrought-iron eyes, tight fitting must be avoided. The conditions are different from those which attend the union of malleable metals, or of cast metals united closely together by turning or planing. In the union of iron and steel plates and various sections, the closer the fit the better, consistently with the erection of the parts. Thus a turned pin fits in its drilled hole just easily by a difference, say, of one-fiftieth of an inch only. The faces of eyes are given only sufficient clearance with the faces of the members which they connect to prevent risk of having to file or plane the faces in order to permit of their insertion. In riveted work it is stipulated that the rivets shall fill their holes; but in fitting eyes between cast-iron lugs the contact both of the eye and of the bolt or pin should be quite easy. The difference is due to the characteristics of the metals. The malleable metal will readily yield sideways to any slight diagonal strain, and the driving-in of rivets will not twist it. The cast metal will fracture if a tie-rod brings a moderate side pressure upon it, and the driving of a bolt or pin tightly will crack it. Fig. 234 illustrates the clearance between the lugs and rods, and

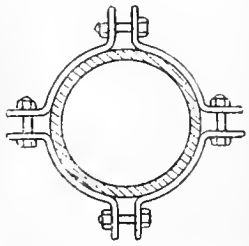

Fig. 236.

⅛in. is not too much to allow in slack fits such as these.

One of the reasons why lugs of cast iron are distrusted is that there is often a risk of their not being sound. Though ample tensile strength may be allowed, yet half of that may be lost by reason of unsoundness. This may be due to several causes, which I explained at length in a previous series, and need not repeat. The principal underlying causes are the facts that these lugs project from the main body of the casting, and the bolt-holes are generally cored—two facts which, unless particular care is exercised in the foundry, contribute to produce unsatisfactory results.

Fig. 234 illustrates the bracing of the screw-piles which support the pavilion on the Southsea Pier. In this case cast-iron lugs are used for the attachment of the bracings—a method not to be commended, and which would be inadmissible in many situations. But the piles are only 14ft. 6in. apart, and the horizontal bracings and the diagonal ties are so rigidly united that there can be little risk of excessive tensile strain coming on any one pair of lugs. The details of the fittings are clear from the drawing. The whole of the ironwork is below water, and there are two circles of piles, connected with horizontal and diagonal bracings. The adjacent piles in each series are connected with bracings formed of old rails inclosing dnodecagonal figures. At A A B B plan sections are given of the upper and lower bracing attachments.

The employment of old steel rails utilised here

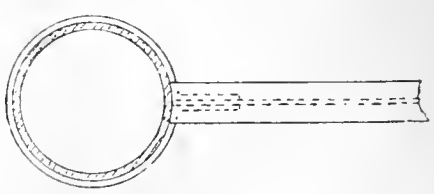

Fig. 238.

is not infrequent: its merit being cheapness. But there is no sacrifice of efficiency, and the practice is therefore to be recommended in many cases. Another example of the use of such rails is shown in Fig. 235, in which the cross-girders and rail-girders are formed of old rails.

Generally, straps of steel or wrought iron are made to encircle the smaller cast-iron pillars, for the attachment of tension rods. In the larger pillars gusset brackets are mostly employed. Fig. 236 illustrates an encircling strap made in four parts for the attachment of four tie-rods. For three rods it would be in three parts, for two in two, and for one either in two parts or a single piece bent round. These are the most common forms.

Fig. 237 illustrates the method of attaching horizontal and diagonal bracings to the piles of the Southampton pier. The former are of channel irons placed back to back, with cast iron distance pieces, 1¼in. thick between, through which the connecting-bolts pass. Wrought-iron straps fitting between the flanges unite these channels

to the columns. The vertical bracings are of round iron, with flat eyes bolted to the straps and horizontal channels, as shown.

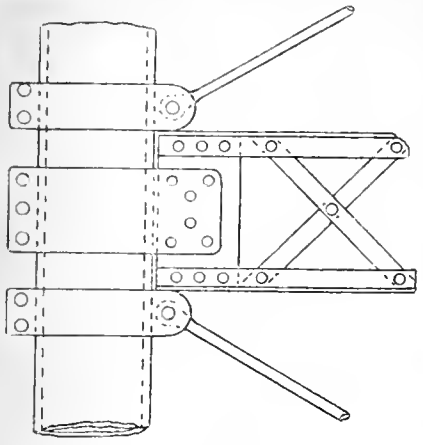

Fig. 239.

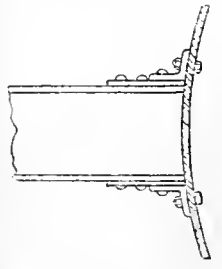
At the top of the pile the union of the main girders to pile-heads is shown. Cast-iron brackets or chairs are the means employed—a case in which a rigid fixing is made by the use of cast iron, at



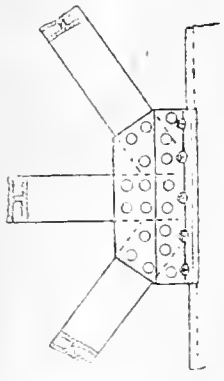


Fig. 240.

a lesser cost than would be incurred by the use of brackets of plate and angle.

Strap attachments are suitable for the heavier

Fig. 241.

as well as for the lighter bracings. Fig. 238 illustrates girders 9in. by 6in. attached to cast piles 2ft. 6in. diameter, with straps 8in. by 3in. Light lattice girders are fastened to cast columns by means of straps, Fig. 239. In such a case a wide plate is riveted next the end of a girder, instead of a narrow vertical, and the strap is riveted to this. Fig. 240 shows H-iron bracings of large cast-iron piles. Here gusset

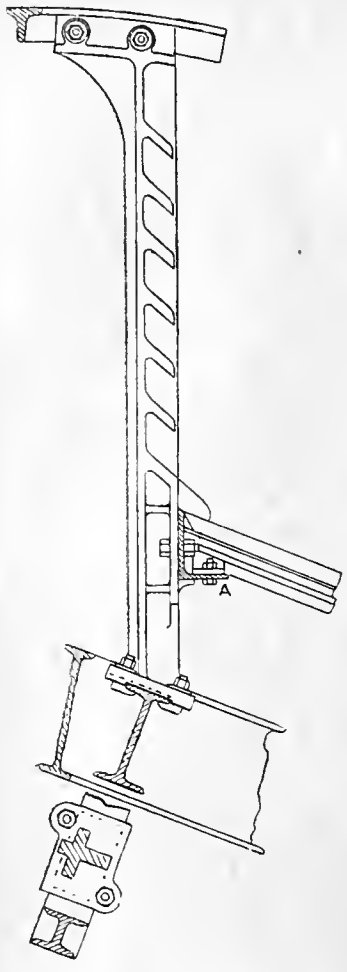

Fig. 242.

plates and angles are employed instead of straps, because of the large diameter of the pillars.

When columns are built up of rolled or Phœnix section, attachments can often be made to the flanges. If the flanges are not sufficiently wide,

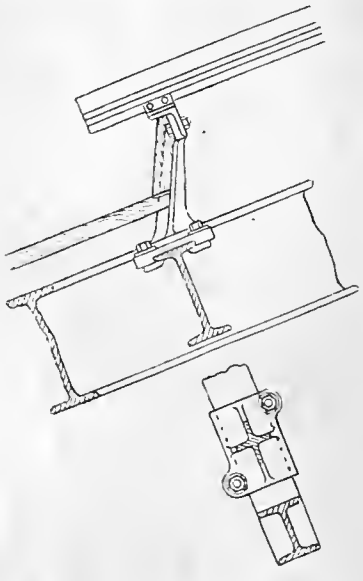

Fig. 243.

the method shown in Fig. 241 can be employed. Thickness webs are riveted between the flanges throughout most of the length, but wide-webbed ribs can be riveted in the positions, and of the length required, or they may be continuous. The ribs projected as shown serve for the attachment of girders, tie-reds, &c. The same webs may form joint connections between lengths of column.

Examples of castings in roof-work are given in Figs. 242, 243. A light iron standard for a skylight is shown in Fig. 242. These are bolted to both principals and purlins, the latter being that illustrated, by means of hook-bolts. The feet of the castings are made to clip the joist flanges so that they cannot shift. At the top the castings on opposite sides are connected by a light tee-iron, and boards cover over these. The castings down each side are connected by means of an angle-iron A, which receives one end of the sash-bars. The sloping ribs placed one above the other receive the louvres. Fig. 243 is a shorter casting which supports the lower end of the sash-bars, and it is fastened to the purlins similarly to the previous one. J. H.

ACETYLENE GAS: THE NEW ILLUMINANT.

At the meeting of the members of the Northern Architectural Association held at the Art Gallery, Newcastle-on-Tyne, on the 2nd inst., a paper on "Acetylene Gas" was read by Mr. C. T. Marshall, M.S.A., of Newcastle. Mr. F. W. Rich occupied the chair. Throughout the evening the hall was brilliantly lighted by means of the illuminant described. A generator, the patent of Mr. W. H. Dargue, of Grey-street, Newcastle, was connected up to the gaspipes, and thus through the ordinary gas-pipes and fittings, but substituting smaller burners. The opinion was generally expressed that the hall had never been so efficiently lighted. Having referred to the interest the introduction of a novel illuminant must possess to all architects, the author proceeded: Acetylene gas, although as a practical light a thing of to-day, possesses a history, and a not uninteresting one. Edmund Davy, in 1836, while experimenting with a process for the production of potassium, found a black residue in the retort, which, like potassium, decomposed water; but instead of the gas given off being pure hydrogen, it was found to be a compound of that gas with carbon, two volumes of hydrogen combining with two volumes of carbon to form a hydro-carbon, differing in composition from any hydro-carbon then known, which we now recognise as acetylene. In 1862 Wohler made carbide of calcium by fusing an alloy of zinc and calcium with carbon, and ascertained that it decomposed in contact with water, forming calcic hydrate and acetylene. In the same year the great French chemist Berthelot made a series of most interesting experiments upon this gas. He found that as the electric arc passed between carbon electrodes in an atmosphere of hydrogen, direct combination took place between these elements, and acetylene was thus synthetically produced. He also found that when the vapours or gases of more complex hydro-carbons came to be passed through heated tubes this same gas made its appearance in small quantities. In addition to carrying out these experiments, he took upon himself the responsibility of giving it a name, and the newest of the hydro-carbons henceforth stood known to the world as acetylene. On October 17, 1892, Macquenne announced to the Academy of Sciences that he had made barium carbide by heating barium carbonate, magnesium powder, and charcoal in an iron bottle, and that on treatment with water or other hydro-xylated compound, it yielded acetylene gas, and on January 19, 1893, Mr. Travers announced to the Chemical Society that he had also made carbide of calcium by heating a mixture of sodium, calcium chloride, and powdered gas carbon, the resulting mixture giving 16 p.c. of calcium carbide. The discovery of a method of making carbide of calcium cheaply and in larger quantities was the result of an accident. Mr. Thomas Leepold Willson, a Canadian chemist, had devised a process for the production of aluminium by the use of an electric furnace, but found himself debarred from carrying out work on aluminium owing to certain patent rights. Whilst attempting to utilise his electric furnace for obtaining the metal calcium by reducing lime with finely-powdered charcoal, he found that at the temperature of the electric arc an interaction took place, which resulted in the evolution of carbon monoxide, and left behind a fused mass which solidified to an extremely hard semi-crystalline body. The experiment was a failure. Anything but pleased with the result of his experiment, Mr. Willson threw the mass into the
